The good quality of the Japanese was seen especially in the class for twenty-four blooms, distinct, the 1st prize in which was a Silver Cup value five guinees, given by Major A. Collis-Browne, Broadoaks, Byfleet, and £4. There were sixteen competitors, and the most successful was Mr. W. Higgs, gr. to J. B. Hankey, Esq., Fetcham Park, Leatherhead. His blooms consisted of the finest novelties, and were Col. B. Smith, Beauty of Exmouth, G. C. Schwabe, M. A. Carrière, Violet Rose, Florence Davis, Albéric Lunden, Vice-President Darquier, W. Seward, Beauty of Castle Hill, Mdlle. Marie Hoste, W. H. Lincoln, Mrs. Nisbet, Falconer Jamieson, W. Tricker, Sunflower, E. Molyneux, Eda Prass, a very highly promising blush-white variety; Etoile de Lyon, Puritan, J. Stanborough Dibbens, Stanstead White, G. W. Childs, and Viviani Morel. Mr. W. H. Tees, gr. to F. A. Bevan, Esq., Trent Park, New Barnet, 2nd; Chas. Davis, E. Molyneux, Mrs. Bryceson, mauve-purple, Col. B. Smith, Viviani Morel, and Sunflower being of merit. Mr. H. Shoemith, gr. to M. Hodgson, Esq., Shirley, Croydon was 3rd; and Mr. W. Collins, gr. to J. W. Carlile, Esq., Ponsbourne Park, Hertford, 4th.

The competition was keen in the class for twelve Japanese, the 1st prize being awarded to Mr. Allan, gr. to Lord Suffield, Gunton Park, Norwich. The flowers were remarkably full, solid, fresh, and splendidly coloured, and were Viviani Morel, Miss A. Hartshorn, Coronet, Mrs. Harman Payne, Avalanche, Stanstead Surprise, Comte de Germiny, John Dyer, Stanstead White, Sunflower, and W. Tricker. Mr. A. Felgate, 2nd; and Mr. F. J. Thorne, gr. to Major Joicey, Sunningdale Park, 3rd. The 1st prize for six blooms, white, one variety, was won by Mr. W. Collins, with Avalanche; Mr. B. Calvert, 2nd, with the same variety; and Mr. R. Jones, gr. to C. A. Smith-Ryland, Esq., Barford Hill, Warwick, 3rd, with Florence Davis. For six, any variety, except a white one, Mr. W. Collins was again 1st, showing Edwin Molyneux; Mr. H. Shoemith, 2nd, with that fine new light bronze-coloured Col. B. Smith; Mr. A. Felgate, 3rd, with the same kind. A good class was for twelve Japanese blooms, distinct, put into commerce in this country in 1891 or 1892. The 1st prize was awarded to Mr. Godfrey, Exmouth, and the following varieties were well exhibited: Aureole Virginale, Miss Dorothy Shea, Duchess of Devonshire, John Farwell, Pearl Beauty, Primrose League, Lizzie Cartledge, Chas. Blick, Van der Heede, Lilian Russell, Princess May, and Mrs. Harman Payne. A very good 2nd was Mr. Shoemith, who had exceptionally fine blooms of Col. B. Smith, Chas. Blick, Mrs. Harman Payne, Beauty of Exmouth, Mdlle. Thérèse Rey, and Eda Prass; Mr. H. Fowler, Taunton, 3rd.

Japanese Incurved.—Mr. W. H. Lees was 1st for six Japanese incurved blooms, showing E. Molyneux, Colonel B. Smith, Madame Carrière, Mrs. Alphens Hardy, W. Tricker, and W. H. Lincoln; Mr. B. Calvert 2nd.

Large-flowered Reflexed.—The competition was sharp for twelve large-flowered reflexed blooms, not less than nine varieties, the 1st prize being awarded to Mr. F. J. Thorne, who showed well Cloth of Gold, Pink Christine, Phidias, Cullingfordi, Golden Christine, Putney George, and White Christine; Mr. A. Sturt, gr. to W. L. Cohen, Esq., Eglefield Green, 2nd.

Large-flowered Anemones.—For twenty-four large-flowered Anemones, Mr. A. Ivies, gr. to C. E. Jukes, Esq., High Barnet, was 1st, with fine blooms. Mr. W. Skeggs, gr. to A. Moseley, Esq., Barnet, 2nd; and Mr. J. Milner, Willenhall Park, Barnet, 3rd. For twelve Anemone blooms, Japanese excluded, Mr. Ives was 1st, with very fine, smooth, even flowers of Gladys Spanling, Delaune, Grande Alveole Beauty of Eynsford, Mrs. Judge Benedict, Glück, Mdlle. M. Brun, a very beautiful novelty; and Annie Lowe. Mr. A. Sturt 2nd, and Mr. Charles Brown, gr. to R. Henty, Esq., Langley House, Abbots Langley, 3rd.

Japanese Anemones.—The Japanese Anemone kinds were well shown. Mr. Ives was 1st for twelve, all in true character, and they comprised Le Deuil, Fabian de Manderanz, Mons. Ponckoucke, Rodolph

FIG. 100.—WIREWORM TRAP.

Darrier, Mrs. S. Coleman, Princess of Wales, Violet Tomlin, and Lord Alcester. 2nd, Mr. A. Felgate, gr. to her grace (Elizabeth) Duchess of Wellington, Burhill, Walton-on-Thames. His best was Mrs. Coleman, a fine specimen. 3rd, Mr. B. Calvert, Bishop Stortford. 4th, Mr. G. Carpenter, gr. to Major Collis Browne, Broad Oaks, Byfleet.

Mr. W. Collins staged the best six blooms of one variety only, showing Mrs. Heale; 2nd, Mr. Joo. Hewitt, gr. to H. B. Mackeson, Esq., Hillside House, Hythe, with Lord Alcester, and Mr. B. Calvert; 3rd, with Violet Tomlin.

Japanese.—This section was wonderfully strong, the blooms were large and well finished, and in most cases the rivalry was keen, and the competitors numerous. In the leading class for forty-eight distinct blooms, and in competition for the Holmes Memorial Cup and £10, the successful exhibitor was W. Herbert Fowler, Esq., Claremont, Taunton, with a magnificent collection. The varieties were—Back Row: J. S. Dibbens, Etoile de Lyon, E. Molyneux, Stanstead White, Mrs. E. M. Clarke, Thomas Hewett, Van Der Heede, Thomas Selwood, Viviani Morel, W. K. Woodcock, Mrs. E. F. Adams, R. C. Kingston, Colonel W. Smith, Julius Röhrs, W. H. Lincoln, Duke of York. Centre Row: Charles Davis, Puritan, Mrs. Mariel Scott, William Tricker, Mdlle. Marie Hoste, C. W. Wheeler, Mrs. F. Jameson, Madame J. Laing, W. W. Coles, Florence Davis, G. C. Schwabe, Miss Dorothy Shea, Potter Palmer, Sunflower, and Violet Rose. Front Row: Miss Anna Hartshorn, Beauté Toulousienne, E. G.

Ragionière, Jeanne Marty, Minnie Chale, James Western, and Mdle. Cabrol; Mr. R. C. Nottcott, Ipswich, 2nd.

Anemone Pompons.—For twelve Anemone Pompons, distinct, three flowers of each, Mr. Jas. Myers, gr. to the Earl of Sandwich, was 1st, and the flowers were not spoilt by getting them too large. *Astrea* was very beautiful. The 2nd place was occupied by Mr. W. Aldridge, gr. to G. Lacey, Esq., Palmers Green; and Mr. C. Brown, 3rd.

Pompons.—For twelve Pompons, distinct, the 1st prize was awarded to Mr. C. Brown, who had excellent flowers of leading varieties, such as William Westlake, Black Douglas, Mdle. Marthe, Comte de Morny, Prince of Orange, Mdle. Elise Dordon, and Pygmalion, Mr. T. C. Turk, gr. to J. Boney, Esq., Cholmeley Lodge, Highgate, 2nd; and Mr. J. Myers, 3rd.

Singles.—A very beautiful lot of singles, twelve bunches, distinct, was shown by Mr. W. C. Pagram, gr. to A. F. Hobhouse, Esq., The Whit, Weybridge. The flowers were large, and unusually fine, and comprised Yellow Jane, snow-flake, also known as Jane, Rev. W. E. Renfrey, Bessie Conway, David Windsor, Gus Harris, Adrienne, Sir T. Symonds, Mary Anderson, and Lady Churchill. Mr. Jno. Agate, Havant, 2nd, and Mr. G. Carpenter, gr. to Major Collier Browne, Broad Oaks, Byfleet, 3rd.

AMATEUR CLASSES.

The five classes following are confined to those who employ no paid assistance whatever in the culture of Chrysanthemums.

For twenty-four Japanese blooms of not less than eighteen varieties, J. R. Wildman, Esq., 9, Grove Road, Clapham Park, S.W., was 1st; Mr. Jno. Horril, West Street, Havant, Hants, 2nd; and Mr. H. J. Parker, 172, New Kent Road, S.E., 3rd. Though the first exhibit was much superior, the whole of them were creditable.

Mr. Jno. Horril was 1st for twelve incurved blooms, showing very well; 2nd, J. R. Wildman, Esq.; and 3rd, Mr. Thomas Lansley, 155, Pinner Road, Watford.

For six incurved blooms, Mr. Thomas, Fort Grange, Gosport, was 1st, his Miss A. Tomlin was very fine, as were others also; 2nd, Mr. J. Brown, 55, Norman Road, South Wimbledon; 3rd, Chas. E. Wilkins, Esq., Woodside, Surrey.

The best twelve Japanese blooms came from Mr. A. Holmes, followed by Mr. Lansley, and Mr. Hicks, Elstree, Herts. Mr. F. Durant, 4, New Road, Ware, Herts, had the best six, including one of Viviani Morel, of extra colour and finish; 2nd, Mr. J. Brown, 55, Norman Road, Wimbledon; and 3rd, Mr. A. Holmes.

AMATEURS AND SINGLE-HANDED GARDENERS' CLASSES.

The best twelve incurved blooms were from Mr. John Little, Hylands, Romford, who showed blooms but little behind those in the open classes; Novelty, Madame Darrier, Lord Wolsley, and Prince Alfred were best; 2nd, Mr. T. L. Turk; 3rd, Mr. E. Tickner, gr. to John Watney, Esq., Shermanbury House, Reigate. Mr. W. C. Pagram, gr. to A. F. Hobhouse, Esq., Weybridge, had the best six; followed by Mr. W. H. Davis, gr. to F. V. White, Esq., Grove Park, Chiswick, and Mr. Chas. E. Wilkins, Woodside, Surrey.

Mr. Little showed extremely well in the class for twelve Japanese blooms, and was closely followed by Mr. E. Tickner, and Mr. W. C. Pagram.

Mr. E. Tickner was 1st in the class for six; Mr. Ed. Mawley, Rosebank, Berkhamsted, 2nd; and Mr. W. Jones, gr. to W. Hooper, Esq., Sleana Mount, Sutton, 3rd.

METROPOLITAN CLASSES.

The best twelve blooms, incurved, diverse, were from F. Bingham, Esq., 6, Bethna Road, Stoke Newington; Mr. W. Davey, gr. to C. C. Paine, Esq., Cedar House, Stamford Hill, was 2nd; and Mr. F. W. Wright, gr. to — Trope, Esq., Essex Lodge, Upper Clapton, 3rd. Mr. J. Bury, gr. to C. Bayer, Esq., Tewkesbury Lodge, Forest Hill, had the best six; Mr. Jas. Brooks, gr. to W. Reynolds, Esq., The Grove, Highgate, was 2nd, almost equalling the 1st collection; and F. Bingham, Esq., 3rd. Mr. Jas. Brookes was 1st for twelve Japanese, showing fresh, nice blooms, Etoile de Lyon was first-rate in colour and finish; 2nd, Mr. Wm. Beech, gr. to L. Seligman, Esq., The Grove, South Kensington; 3rd, F. Bingham, Esq. The latter exhibitor was 1st in the class for six blooms; Mr. E. Vince, Highgate Cemetery, 2nd; and Mr. J. Bury 3rd.

TABLE DECORATIONS AND BOUQUETS.

These were exhibited in the library, and not, as in previous years, crowded together in the galleries. The principal class was for a table of bouquets, wreaths, sprays, &c., illustrating the decorative value of the Chrysanthemum. An exquisite assortment of various devices was that from Messrs. Perkins & Sons, Coventry; Messrs. Gilbert & Davidson, South Wales, 2nd. For three vases or epergues, Mr. J. K. Chard, Stoke Newington, was an easy 1st, using the *Ampelopsis Veitchi* tastefully; Mr. F. W. Seale, Vines Nurseries, Sevenoaks, 2nd.

Mr. Walter Salmon, 2, Ivy Cottages, Elder Road, West Norwood, was 1st for a hand-basket of autumn foliage and berries, arranged for effect, with a superb arrangement; and Mr. Jno. Horne, West Street, Havant, was 2nd.

GROUPS AND PLANTS (OPEN).

The plants were extremely well grown—better than for many years past, but there seemed to be fewer groups. The groups of importance were those from Mr. H. Jones, Rycroft Nursery, Hither Green, Lewisham, and Mr. Norman Davis, Lifford Road Nursery, Camberwell. Both had splendid arrangements, the individual flowers remarkably fine; they were awarded prizes in the order named.

For six trained specimens, large-flowered varieties, including Japanese, Mr. D. Donald, gr. to J. G. Barclay, Esq., Leyton, was 1st; his plants were a feature of the show, and they were of the varieties Margot, Stanstead Surprise, Madame B. Rendatler, White Christine, Gloriosum, and Dr. Sharpe, Mr. John Hughes, gr. to G. R. Higgins, Esq., East Lane, Dulwich Village, 2nd; and Mr. W. Wesker, gr. to A. Haver, Esq., Upper Tooting, 3rd.

For four specimens, the 1st prize was won by Mr. G. W. Hendon, gr. to J. Spiers, Esq., Tottenham, who had fine plants of *L'île des Plaisirs*, Margot, Stanstead Surprise, and La Triomphante; Mr. W. Davey, gr. to G. C. Paine, Esq., Cedar House, Stamford Hill, 2nd, with very praiseworthy plants of Elsie, Mons. Tarin, Dr. Sharpe, and Wm. Robinson; Mr. F. Gilks, gr. to W. E. Freir, Esq., Forest Road, Walthamstow, 3rd. Mr. Davey was 1st for six trained specimens, showing well plants of Elsie and Madame B. Rendatler; Mr. Donald 2nd. Mr. G. W. Hendon came 1st in the class for four specimens, having fine examples of Stanstead Surprise, La Triomphante, Margot and Madame B. Rendatler; Mr. F. Gilks and Mr. J. Hughes 2nd and 3rd respectively.

The trained Pompons were of great merit. The 1st prize six were from Mr. J. Hughes, and comprise the varieties *Msroon Model*, the flowers deep mauve-purple; *Golden Cedo Nulli*, Lilac Cedo Nulli, St. Michael, St. Justin, and White Cedo Nulli; Mr. Donald 2nd; Mr. Astie, Antonius, Aurora Borealis, and Cedo Nulli; Mr. F. Gilks 3rd.

The best specimen pyramid-trained was from Mr. Donald, and the finest plant we have seen of the variety Margot; Mr. J. Hughes 2nd, showing Mrs. Dixon; and Mr. F. Gilks 3rd, with Madame B. Rendatler.

SPECIAL PRIZES.

Several special prizes were offered, and for interesting exhibits, Mr. G. C. Paine, Cedar House, Stamford Hill, offered prizes for six naturally-trained, large-flowered specimens. Mr. Gilks was 1st, showing beautiful examples of W. Tricker (very good), Coquette de Castile, Florence Davis, W. Holmes, Lady Selborne, and Val d'Andorre; Mr. E. Vince, Highgate Cemetery, N., 2nd. Mr. E. C. Jukes, Hadley Lodge, Barnet, offered prizes for twelve incurved blooms, to "encourage the cultivation of the smaller and beautiful type of incurved blooms, such as Mrs. Rundle, Mrs. Shipman, &c." The 1st prize was awarded to Mr. R. Petfield, gr. to A. J. Thornhill, Esq., Dodington, Hants, and he exhibited such kinds as Eve, Geo. Glenny, and Mabel Ward; Mr. W. H. Tees, 2nd, showing Lord Eversley and Empress Eugénie well.

Mr. H. J. Jones offered prizes for six blooms of seedling Chrysanthemums of his own raising, and six blooms distinct, of new varieties, not necessarily his own. Mr. W. J. Godfrey, Exmouth, was 1st in the former class, and Mr. W. H. Fowler 2nd. Many of these varieties will possibly take a place in the best collections, the more important being Miss Dorothy Shea, Van den Heede, Golden Wedding, W. H. Atkinson, Autumn Tints, and F. M. Sanders.

Two classes were provided by Mr. Owen, Castle Hill Nursery, Maidenhead. One was for "twelve blooms of not fewer than four varieties of the six new incurved varieties distributed by him in 1893, viz.,

Baron Hirsch, Brookleigh Gem, George Cockburn, Henry Perkins, Lucy Kendall, and Mrs. Mitchell." The 1st prize was won by Mr. Jas. Agate, who had very good blooms.

The special prize of Mr. Godfrey, The Nurseries, Exmouth, Devon, was for six blooms of Beauty of Exmouth, the white Japanese kind; and very fine flowers came from Mr. Ritchings, gr. to Dr. Frankland, The Yews, Reigate Hill.

MISCELLANEOUS EXHIBITS.

These were less numerous than upon some occasions, and consisted for the most part of Chrysanthemums, added to which were a few collections of foliage and flowering plants, which helped much to relieve the dull appearance of the building.

Mr. H. J. Jones, Rycroft Nursery, Hither Green, Lewisham, had a magnificent arrangement on a large table near the centre of the building. Large numbers of cut blooms arranged on trays, together with others in very large vases, to form a background, were much admired. Most of the varieties shown are noticed in another column, as seen at the nursery. Another large collection of cut blooms, representing most of the new varieties, and including many seedlings, was from Mr. Robert Owen, Maidenhead. Twelve blooms of the new Beauty of Exmouth were shown in capital condition, and a like number of blooms of a new one called Bride of Maidenhead, very similar in size and form to the one just mentioned, but being pure white. Another seedling was in form and colour a little similar to Florence Davis, but larger. Caledonia looked like a promising Japanese Anemone.

Messrs. H. Cannell & Sons, Swanley, had a large table of zonal Pelargonium blooms in their charming varieties, which created much attention, also a good number of Chrysanthemum blooms, some of them an exceptional size, such as Etoile de Lyon, Col. W. Smith, International, Amy Chantler, Duke of York, and Viviani Morel. Messrs. Cannell also exhibited a first class collection of vegetables, and a large number of Potatoes. Mr. W. Wells (Earlwood Nurseries, Ltd.), Redhill, contributed a collection of the newer varieties of Chrysanthemums, and including a good number of single ones. Mr. Jno. Smith, St. Leonard's Road Nursery, Windsor, sent twelve blooms of a white decorative variety with pink centre, called Royal Windsor; and Mr. W. E. Boyce, of Archway Road, Highgate, a collection of blooms, including some pretty seedlings; Messrs. E. D. Shuttleworth & Co., Ltd., Peckham Rye, had a very tastefully arranged table of miscellaneous plants, including choice *Dracænas*, *Crotons*, *Heaths*, &c. What constituted an enticing group, and composed of *Cattleyas* in flower, and *Odontoglossums*, with a groundwork of Fern, came from Messrs. B. S. Williams & Son, Upper Holloway, London, N., and was arranged upon a table near the centre of the building; Messrs. Wm. Cutbush & Son, Highgate Nurseries, London, N., had a table of *Ericas* in variety, *Dracænas*, Palms, and other plants, also a collection of Apples and Pears, and a specimen bunch of their *Chasselas Napoléon* Grape.

Messrs. Jno. Laing & Sons, Forest Hill, London, S.E., had a stand of large Chrysanthemum blooms, in the centre of which was a group of the pretty *Saxifraga sarmentosa tricolor variegata*; also a collection of Apples and Pears.

Nine dishes of well-coloured Apples came from Mr. W. T. Fletcher, Ottershaw Nursery, Chertsey. Mr. H. Berwick, Sidmouth Nurseries, Sidmouth, staged 100 dishes of fruit, consisting of Pears and Apples, large and well-coloured.

From Messrs. Sutton & Sons, Reading, came a fine exhibit of their best Potatoes, including samples of Satisfaction, Triumph, Supreme, Windsor Castle, Surprise, and Abundance. Potatoes were also exhibited by Mr. C. Fidler, Reading, who had a large heap of his Colossal variety exhibited on a table.

FRUIT AND VEGETABLES.

As usual there was a good display of fruit and vegetables, arranged in the gallery. Mr. Thos. Turton, gr. to Jno. Hargreaves, Esq., Maiden Erlegh, near Reading, was 1st for six dishes of dessert Apples; Mr. Chas. Roas, gr. to Colonel Archer, Welford Park, Newbury, 2nd; and Mr. T. Haines, gr. to the Hon. D. P. Bouverie, Colehill House, Highworth, 3rd. The same exhibitors in the same order were successful in the class for culinary Apples, the fruit in both cases being good.

For dessert Pears, Mr. W. Allan, gr. to Lord Suffield, Gunton Park near Norwich, was 1st; Mr. H. Berwick, Sidmouth Nurseries, 2nd; and Mr. Thos. Turton, 3rd.

The best twelve dishes of Potatoes came from Mr.

James Simkin, Shillington, near Hitchin, with a really fine collection; Mr. T. H. Ridgewell, Histon Road, Cambridge, 2nd; and Mr. E. Choppin, Milton, Sittingbourne, 3rd. The exhibits in this class were exceedingly numerous.

Mr. Simkin was again 1st for six dishes, Mr. Choppin 2nd, and Mr. Chas. Ross 3rd.

Grapes were shown well, the best three bunches of white coming from Mr. C. Griffin, gr. to A. Christy, Esq., Kingston-on-Thames, with Muscat of Alexandria; 2nd, Mr. Bury; and 3rd, Mr. Jno. Masterson, gr. to the Countess of Camperdown, Weston House, Shipston-on-Stour.

For three bunches of black Grapes other than Gros Colmar, Mr. C. Griffin was 1st; Mr. W. Allen 2nd; and Mr. E. Cooper, The Vineries, Bagshot Road, Sunninghill, 3rd.

The best Gros Colmar were shown by Mr. Bury and Mr. T. Newman, gr. to T. A. Tulk, Esq., Chertsey, 2nd; whilst Mr. W. Chuck, gr. to P. Thellusson, Esq., Broadworth Hall, Doncaster, was 3rd.

The collections of vegetables exhibited for the special prize offered by Messrs. Sutton & Sons, Reading, were unquestionably good. The 1st prize was taken by Mr. W. Pope, gr. to the Earl of Carnarvon, Highclere Castle, Newbury; 2nd, Mr. C. J. Waite, Glenhurst Gardens, Esher; 3rd, Mr. Richard Lye, gr. to W. H. Kingsmill, Esq., Sidmonton Court, Newbury.

The prizes offered by Mr. Fidler, Reading, for the best six dishes of Potatoes, three of which were to be his own varieties, were taken by Mr. J. H. Ridgewell, Mr. Chas. Ross, and Mr. C. J. Waite, respectively.

KINGSTON AND SURBITON.

NOVEMBER 7, 8.—This year's show well sustained the high reputation of this, the best of our metropolitan societies. If trained plants were fewer—and that is of no great importance, cut blooms were in greatly increased numbers—some 50 dozens, indeed, beyond previous years. In other than Chrysanthemum classes there was strong competition, and very high quality. The only exception, perhaps, was found in the miscellaneous groups. The only one in competition came from Mr. Cooke, Walton, and was awarded the 1st prize. Messrs. Puttock & Shepherd had one other group, not for competition.

Groups of Chrysanthemums.—Last year's winner, Mr. Mileham, gr. to A. T. Miller, Esq., Leatherhead, was a good 1st; his blooms were chiefly Japanese, all fine, and there was a capital facing of dwarf plants. Mr. G. Peed, gr. to R. L. Bond, Esq., Surbiton, was 2nd; Mr. Springthorpe, gr. to E. W. Bevan, Esq., Coombe Court, 3rd; and Mr. Pitcher, Albury House Gardens, Surbiton, 4th.

The best six trained plants, dwarf, and about 3½ feet across, came from Mr. J. Swan, gr. to G. Murray Smith, Esq., Weybridge; they included three Christines, two of the Rundles, and Peter the Great. Mr. F. King, gr. to A. F. Perkins, Esq., Holmewood, had for 2nd some capital standards, rather hard tied, of elegant Stanstead Surprise, Elaine, and Curiosity.

The best four Pompons came from Mr. Swan, who had Mdle. Marthe, Golden do., Mr. Astie, and Marie Stuart. Other plants were shown numerously in smaller classes. Of Carnations, Mr. J. Wilkins, The Grange Gardens, Kingston Hill, had the best. Mr. Peed had the best Bouvardias, a capital lot of plants. Mr. Clarke, gr. to A. Nagle, Esq., best berried plants, in some admirable Solanums; Mr. C. Lane, gr. to C. H. Coles, Esq., Canterbury, the best nine table plants, in a big competition; and Mr. F. Hopkins, gr. to Mrs. Widderspoon, Walton, the best lot of six plants. Chinese Primroses were numerous, the six of singles, all white, placed 1st, coming from Mr. Peed; and the first half dozen of doubles, really splendid plants, of Marchioness of Exeter, and White Lady, came from Mr. W. Mease, gr. to A. Tate, Esq., Leatherhead. This fine lot secured the *Gardeners' Magazine* Medal for special high culture.

Cut Flowers, of course, constituted the chief attraction of the show, especially the Old and New Challenge Vases. For these, twenty-four Japanese, and twenty-four incurved flowers had to be staged. The Old or sixth Challenge Vase won successively by A. Tate, Esq., Leatherhead, Major Collis Browne, Weybridge, and T. Bryant, Esq., Juniper Hill, could be competed for by those doughty competitors only; and Mr. Mease who won it for Mr. Tate last year, takes it finally back to Downside. This grower had a fine lot of Japanese, including Robert Owen,

in wonderful form. Viviani Morel, W. Seward, V. P. Calvat, Col. B. Smith, Mrs. H. Payne, E. Molyneux, and Mrs. Cannell, very fine; and of incurved, M. R. Bahuant, Marquis de Paris (elsewhere shown as a Japanese), Robert Cannell, Princess Teck, Violet Tomlin, C. B. Wetherall, Nil Desperandum, &c. Mr. Beckett, gr. to Mr. Bryant, was 2nd, having some capital Japanese, and very good incurved. Mr. Carpenter, Major Collis Browne's gardener, was 3rd. The New or seventh Challenge Vase, a handsome urn, brought severe competition, but fell to a new exhibitor in Mr. Neville, gr. to F. W. Flight, Esq., Winchester, whose Japanese, if not so large as some others, were admirably selected, and even. These included Col. B. Smith, Sunflower, Beauté Toulousienne, a short-petalled Molyneux, Marquis de Paris, quite open, Gloire du Rocher, &c. Of incurved, he had M. R. Bahuant, Baron Hirsch, Princess of Wales, Mrs. Coleman (selected as the premier incurved), Mrs. Heale, Miss M. A. Haggas, Queen of England, &c. Mr. Hunt, gr. to P. Kalli, Esq., Ashstead Park, was 2nd.

A mixed class of twelve Japanese, and twelve incurved for a cup and prize, brought a good competition. Mr. Coombs, gr. to W. Furze, Esq., Teddington, being a good 1st with capital flowers. Mr. Adler, gr. to C. W. Izod, Esq., Esher, being 2nd. Turning to the other classes, we have to refer to them briefly. Mr. Higgs, gr. to J. B. Hankey, Esq., Leatherhead, was well in with twenty-four Japanese, having good Albéric Lunden and Violet Rose. Mr. Mease was 2nd, and his best were Charles Davis, Madame Charles Hay, Mrs. H. Payne. Mr. Hunt had the best twelve Japanese, Mr. Holderbury 2nd, with six blooms. Mr. T. King was 1st with six of one variety, a splendid competition. Smith Ridge, gr. to C. Swinfen, Esq., Weybridge, was best with fine Viviani Morel. Sunflower from Mr. Felgate, Walton, coming 2nd; and Mr. Hunt 3rd, with Falconer Jameson. In a special class for six selfs, some fine blooms of Col. W. B. Smith, came from Mr. Coombs; and of a similar class for six whites, Mr. Griffin, gr. to A. Christy, Esq., Coombe, had the best with Avalanche. The premier Japanese was a fine bloom of E. Molyneux, shown by Mr. Hunt. Turning now to incurved we found Mr. Higgs repeating himself, taking the 1st prize for twenty-four fine flowers, really good in form, although it is fair to say that the incurved blooms were not up to the size and form of last year. The collection included Golden Empress, Lord Alcester, Empress of India, Queen of England, John Doughty, Lord Wolseley, Miss Haggas, Prince Alfred, &c. Mr. A. Finlay, gr. to M. Grant, Esq., Cobham, was 2nd; Mr. Mease 3rd, with twelve blooms. Mr. Hopkins was 1st, Mr. Beckett being next with six blooms. Mr. Thorne, gr. to A. E. Flood, Esq., Walton, took 1st place. And with six of one variety Mr. Hopkins was best with fine Violet Tomlin; 2nd, Princess of Wales, from Mr. Neville; Baron Hirsch from Mr. Coombs being 3rd. Of Anemones, Mr. Jinks had the best 12 very fine blooms, Mr. Woodgate being 2nd. In reflexed Mr. Measures was 1st, Mr. Felgate being 2nd. There were numerous other small and local classes, which it is not possible further to refer to; but the competition was not only good, but remarkable for the large number of new exhibitors.

Fruit was good and plentiful. Mr. C. J. Waite, The Gardens, Glenhurst, Esher, had the best four dishes in fine Alicante Grapes, Coe's Golden Drop Plums, Beurré Diel Pears, and King of the Pippins Apples; Mr. G. H. Page, Ham House Gardens, was 2nd. The latter, however, had the best four dishes of Apples, in fine samples of Alfriston, Blenheim, and King Pippins, and Winter Pearmain. Mr. Waite was 2nd, with four dishes of Pears. Mr. G. Trinder was a good 1st, having very fine Doyenné du Comice, Pitmaston Duchess, Beurré Diel, and Beurré Bachelier. The best black Grapes, Alicante, came from Mr. Griffin, but Mr. Newman, gr. to J. Tulk, Esq., Chertsey, had some very fine and well-coloured Gros Colmar for 2nd that were most meritorious. Mr. Griffin had, in fair Muscatel Alexandria, the best whites. Mr. Waite was, on this occasion, the only exhibitor of a basket of vegetables. Mr. Springthorpe beat the professionals with a very handsome bouquet, and Miss C. F. Mitchell, Kingston, beat Miss C. Cole, of Feltham, with a stand of leafage and berries, but the positions were reversed in another class.

HORSHAM CHRYSANTHEMUM.

OCTOBER 31 and NOVEMBER 1.—The fourth exhibition of this Society was held on above date. Owing to the number of shows held during the week, reports

are necessarily condensed. The chief prize-winners in the open classes for cut flowers were Mr. G. Duncan, gr. to C. T. Lucas, Esq., Warnham Court; Mr. W. Wallis, gr. to Mrs. Mews, Hartfield; Mr. T. Sparkes, gr. to Mr. E. Allcard, Horsham; and Mr. G. Goldsmith, gr. to Sir E. Loder, Leonardslea.

In the amateurs' classes for cut flowers, Mr. Champion, 28, St. Leonard's Road, Horsham, was most successful.

Groups were fairly well shown, Messrs. Haskell, G. Marshall, E. Daniels, and J. Salter, being in good form. Other 1st prize winners were Messrs. G. Goldsmith, E. Daniels, E. Lawrence, T. Dancy, H. Harris, and T. Sparkes, who exhibited in the higher class for amateurs.

For baskets (ladies only), Mrs. A. Aldridge, Mrs. Champion, and Mrs. Stott, took honours in the order named; Miss Willison being 1st for a bouquet, and also for a spray.

Fruit was fairly well represented, Messrs. Dancy, Duncan, Goldsmith, and Kemp, taking premier honours.

Several special prizes were given, both for cut blooms and collections of vegetables, the latter by Messrs. Sutton & Sons, being awarded to Messrs. E. Lawrence, T. Sparkes, and H. Harris, in the above order.

THE BATTERSEA AMATEUR CHRYSANTHEMUM AND HORTICULTURAL.

NOVEMBER 1.—This Society, which is composed largely of working men, held their second annual Chrysanthemum show in one of the Mission-halls on the above date, and the advance upon last year was most striking. With the exception of a charming group of foliage and flowering plants from Mr. R. Neal, nurseryman, Wandsworth, and one of Chrysanthemums from Mr. Norman Davis, nurseryman, Camberwell, the contributions were entirely from members. Mr. W. Charman, gr. to H. Russell, Esq., Clapham Common, was the only exhibitor of specimen plants, having three admirable ones, two of Mdle. Lecroix, and one of Edward Audiguier; Mr. Bond, Frances Street, had the best twelve blooms, six incurved and six Japanese, M. R. Bahuant, Prince Alfred, and Lord Derby among the former being highly praiseworthy. Mr. Flood, Ashbury Road, was 1st with twelve Japanese, and very good they were. Mr. J. O. Langrish, the Hon. Sec., came 1st with six coloured Japanese, and he was also 1st with the same number of blooms of white. Reflexed flowers consisted chiefly of Japanese, Mr. Bolton being 1st with six very good flowers. Anemone-flowered and Pompons were also in good form, as were vases and baskets of Chrysanthemums. Mr. Bolton had the best group of plants of Chrysanthemums arranged for effect. Such a society as the above should be in operation in every working-class district of London.

STEYNING CHRYSANTHEMUM.

NOVEMBER 2.—This was a very successful meeting, the exhibits being good, and the arrangements excellent. There was a substantial increase in the number of exhibits, which numbered 252 this season, against 175 last year. Mr. Grace was 1st for a group of plants, with a well-arranged collection. Mr. G. Hart, gr. to H. Head, Esq., Shoreham, was remarkably successful, taking first honours for three plants, (distinct), a specimen plant, twenty-four Japanese, twelve Japanese, six Anemone-flowered, six reflexed, and twelve bunches of Pompons, in addition to other honours. The 1st prizes for six Japanese, and for six of any one variety were taken by the indefatigable secretary, Mr. A. Slaughter, who was also successful in what was evidently the chief class of the day, viz., the local Challenge Cup and the National Chrysanthemum Society's Silver Medal. This was a grand exhibit, and was well in front of the remaining competitors.

Amateurs with less than 100 plants, the 1st prizes were awarded as follows:—For a group, E. Cripps, Esq., Steyning, who was also the winner for twelve and six blooms. The prize for three plants was awarded to Mr. Dell, Shoreham.

Cottagers' Division.—Three plants, Mr. M. Turrell, Steyning; six blooms, Mr. H. Goacher, also 1st for six bunches; bouquet, with hardy Fern or foliage, Mr. A. Heryett.

Open to ladies only.—A basket of Chrysanthemums, for effect, produced strong competition, about a dozen good exhibits being staged, resulting in Miss F. White and Miss K. White being awarded 1st and

2nd; Miss Flowers making a good third. An extra prize was deservedly awarded to Miss Head, Shoreham. The premier prize in this class was a piece of plate. 1st prize was taken by Mrs. Flowers for a hand bouquet, a similar honour falling to Miss F. C. Wood, for a spray of Chrysanthemums.

The *Gardener's Magazine* Silver Medal was won by Mr. A. F. Grace.

Special Prizes were given for various exhibits, by Mr. H. Jones, Lewisham; Mr. H. J. Burt, Steyning; H. Head, Esq., Shoreham; Mr. C. Kilminster, Steyning; Mr. W. Hills, Mr. Meeters, Mr. Miller, Mr. J. Wood, and the Society.

Some pleasing exhibits, not for competition, were sent by the following trade growers: Mr. Jones, Lewisham; Mr. Hills, and Mr. Kilminster, Steyning.

CRYSTAL PALACE CHRYSANTHEMUM.

NOVEMBER 3, 4.—The annual show, held in the Palace, is usually an occasion for spirited competition, and for a very fine display of first quality blooms. That held on the 3rd and 4th inst. was no exception in this respect, for in each class there were many competitors, and the difference in the merit of some of the exhibits was so small as to give the judges considerable work in determining the awards. If any section was weak, it was the incurved, the flowers in some cases being rather late, and just a day or two behind exhibition form. Plants and groups were of average quality, many of them not quite so fine as we have seen them.

The first class for twenty-four Japanese and twenty-four incurved blooms, with not fewer than eighteen varieties of each, or more than two of any one variety, was well won by Mr. C. Ritchings, gr. to Dr. Frankland, The Yews, Reigate Hill. The Japanese were good, and included the following among the newer kinds:—Colonel W. B. Smith (very fine), Puritan, W. Seward, Vivian Morel (in capital colour), President Borel, Mrs. C. Harman Payne, Florence Davis, Excelesior, and Beauty of Exmouth; Edwin Molyneux was a first-rate colour, and of good size. It was in the incurved blooms, however, that this exhibitor was to the fore, most of them being well "up," neat, and of good size. There were not many new ones included; Madame Darrier, Prince Alfred, Geo. Cockburn, Baron Hirsch, and Lady Hardinge were some of the latest of those shown. The 2nd position was taken by Mr. H. Shoemith, gr. to M. Hodgson, Esq., Shirley Cottage, Croydon. The Japanese were good, but not quite representative in colour; there were excellent blooms of white Vivian Morel, Eda Praas, Charles Davis, and Col. W. B. Smith. Amongst the incurved were included M. Martignac—an excellent yellow bloom, and the new Brookleigh Gem. Mr. C. J. Salter, gr. to T. B. Haywood, Esq., Woodhatch Lodge, Reigate, was 3rd; the Japanese were lovely specimens, but the incurved blooms were rather small, not fully developed.

For eighteen incurved blooms, Mr. W. H. Lees, gr. to F. A. Bevan, Esq., Trent Park Gardens, New Barnet, was 1st, and showed a stand of very good blooms; noticeable were Lord Alcester, Mr. Colman, Golden Empress of India, Princess of Wales, and Miss Hagga. 2nd, Mr. Geo. Carpenter, gr. to Major Collie Browne, Broad Oaks, Byfleet; and 3rd, Messrs. W. & G. Drover, Fareham, Hants, who caused considerable surprise by exhibiting below their usual form. In the class for twelve, Mr. A. Felgate, gr. to Her Grace (Elizabeth) the Duchess of Wellington, Burhill, Walton-on-Thames, was 1st. The collection contained a good bloom of Noel Pragnell, nearly white, but having a little magenta on most of the florets; 2nd, Mr. W. Jupp, gr. to G. Boulton, Esq., Torfield, Eastbourne.

The best six incurved blooms of any variety came from A. B. Welch-Thornton, Esq., Beaurepaire Park, Basingstoke (gr. Mr. H. Brown). The variety was M. R. Bahuant, shown in good size and colour; 2nd, Mr. Wm. Jupp, with Princess of Wales; and 3rd, Mr. Geo. Goldsmith, gr. to Sir E. G. Loder, Bart., Leonardalee, Horeham, who had Madame Darrier.

Mr. W. H. Lees had the best eighteen Japanese blooms, showing a fine collection, which included Mr. G. Bryceson—a very fine deep magenta, and a capital bloom of E. Molyneux; Messrs. W. and G. Drover were 2nd, but their stand suffered from the absence of a single white bloom; otherwise, the flowers were good. Mr. Charles Cox, gr. to J. Trotter, Esq., Brickenden Grange, Hertford, was 3rd.

Mr. E. Tickner, gr. to J. Watney, Esq., Sherburn House, Reigate, had the best twelve Japanese; President Borel, Lord Brooke, and Vivian Morel were especially attractive. 2nd, Mr. A. Felgate, who

had excellent blooms of Louis Boehmer and Col. W. B. Smith; and 3rd, Mr. J. Harwell, gr. to A. J. Jack, Esq., Brightlands, Reigate.

The best six blooms of any variety of Japanese were from Mr. J. MacDonald, gr. to Captain Marling, Clanna, Lydney; the variety was Edwin Molyneux, and the blooms were large, and of good form and colour. Mr. A. Felgate was 2nd, with splendid blooms of Colonel W. B. Smith, in which the twisted character of the florets was well marked; and Mr. W. J. Ouden, gr. to A. Morris, Esq., Court Green, Streatham, 3rd, with rather pale coloured Vivian Morel.

The 1st prize in the class for eighteen reflexed and Japanese reflexed blooms was taken by Mr. C. J. Salter; the exhibit included Rosy Morn, W. Seward, J. Shrimpton, and Gloire du Rocher. Mr. A. Felgate was 2nd, with flowers considerably smaller; 3rd, Mr. C. Ritchings.

Mr. C. J. Salter was 1st for Anemone and Japanese Anemone blooms, showing a capital lot, which included Duchess of Westminster, a variety with long florets and rose and yellow cushion; Mons. Lebosqz, Delaware, Sabine, and Thorpe Junior, the latter a very good yellow; 2nd, Mr. J. Miller, gr. to Mrs. W. A. Higgs, Willenhall Park, Barnet; Sœur Dorothee Souillé, a pure white variety, in this stand was very good. Mr. R. C. Notcut, Broughton Road Nursery, Ipswich, was 3rd.

The best Pompons were from Mr. J. Knapp, gr. to F. W. Amaden, Esq., Croydon, and were well shown; Mr. C. J. Salter was 2nd; and Mr. H. Harris, gr. to Mrs. Eversfield, Denne Park, Horsham, 3rd.

The Pompon Anemones formed a most pleasing class, and were well shown by Mr. C. J. Salter; 2nd, Mr. H. Harris; and 3rd, Mr. J. Knapp.

Mr. Geo. Carpenter exhibited singles in capital form. Purity was a lovely white, Sir T. Symond, a good yellow one; and Rev. Renfrey, an extra deep-coloured flower.

Specimen Plants, as we have already said, were about average merit. For six trained Pompon varieties, Mr. J. Hughes, gr. to J. R. Higgins, Esq., Baetlands, Dulwich, was 1st, and these were as well shown as any we have seen in this section; 2nd, Mr. W. Weeker, gr. to G. Heaver, Esq., Streatham Elms, Upper Tooting, was 2nd; and Mr. W. Carr, 3rd.

The best Japanese were shown by Mr. Hughes; and Mr. W. Walker and Mr. E. Cherry, gr. to Mrs. Gabriel, Norfolk House, Streatham, 2nd and 3rd respectively. Mr. Hughes was again 1st for six specimen incurved, they included nice plants of Lord Wolseley, G. Glenoy, and Hersward; Mr. E. Cherry was 2nd.

Twelve standards were shown best by Mr. W. Carr, gr. to Mr. S. Clarke, Croydon; Mr. G. H. Cooper, Sydenham Nursery, Croydon, was 2nd; and Mr. J. Carpenter 3rd.

Groups.—Messrs. J. Carter & Co. were 1st for a group arranged for effect (Japanese only), on space not exceeding 100 square feet, with a very commendable group; and Messrs. J. Mobsley & Son, 147, Moffat Road, Thornton Heath, were 2nd.

For a group of any sort on 50 square feet, open to amateurs only, Mr. T. W. Wilks, gr. to C. Ralph, Esq., Cranbrook Villa, Upper Norwood, was 1st, and showed in good style; 2nd, Mr. H. Baker, gr. to C. J. W. Rabbits, Esq., Westwood House, Sydenham.

Certificates were given to Pompon Florence Carr, a small deep bronze variety, shown by Mr. W. Farr; and to Beauty of Exmouth, shown by Mr. Godfrey, Exmouth.

Messrs. Jno. Laing & Sons, Forest Hill, S.E., put up a very pretty group of miscellaneous plants, including Orchids, Bertolonias, Chrysanthemums, &c.; and Mr. W. Wells, Earlswood Nursery, Redhill, staged a collection of Chrysanthemum blooms, including a large number of decorative, Pompon, and single varieties.

KENT COUNTY CHRYSANTHEMUM.

NOVEMBER 1.—The annual exhibition of the Kent County Chrysanthemum Society, on Wednesday, at the Rink Hall, Blackheath, has eclipsed its predecessors, both in the number of entries and the quality of the exhibits. The 1st prize for groups was awarded to Mr. J. Vavasseur of Blackheath Park (gr. Mr. Rhoden), for a carefully-blended collection of fine Chrysanthemums, composed chiefly of Japanese. The winner of the 2nd prize, Mrs. Penn of The Cedars, Lee, (gr. Mr. Fox), made the competition extremely close, the group being extremely effective, and containing fine specimens

of The Sunflower, Mrs. Jameson and William Holmes varieties.

Between the Chrysanthemum groups were arranged others composed of foliage plants and flowers, the 1st prize for which went to Mr. H. F. Tiarks of Chislehurst (gr. Mr. Lyne); Mr. S. Whyte of Oakwood, Crayford (gr. Mr. Tomlin), took the 2nd prize.

The Chrysanthemum groups were exhibited by Mr. H. Paine, of the Paragon, Blackheath (gr. Mr. E. H. Megge); Mrs. Wainwright, Belmont, Lee (gr. Mr. J. Pearce); and Mrs. Crundwell, of The Moat, Eitham (gr. Mr. Jeffery).

Flowering plants were exhibited by Messrs. B. S. Williams & Son, of Upper Holloway; Mr. James Williams, of College Park Nursery, Lewisham; and Messrs. Laing & Son, of Forest Hill.

The exhibition of fruit, though of small dimensions in comparison with the flowers, contained some splendid specimens, Pears and Grapes being especially well represented.

The prize for the best Japanese Chrysanthemum in the show was awarded to Mr. Hodgson, of Shirley, Croydon (gr. Mr. Shoemith), for a grand specimen of Edwin Molyneux. Mr. A. G. B. Hubble, of Elmstead Lodge, Chislehurst (gr. Mr. Leadbetter), gained the prize for the best incurved Chrysanthemum, a "Prince Alfred," of the Queen section. The president's prize for twenty-four cut blooms (eight Japanese, eight incurved, and eight reflexed) went to Mr. S. Whyte, of Oakwood, Crayford (gr. Mr. Tomlin), whose collection was of much excellence.

WATFORD CHRYSANTHEMUM SHOW.

NOVEMBER 7, 8.—The eighth annual show of the Watford Chrysanthemum Society took place on Tuesday and Wednesday last in the Clarendon Hall, Watford. The exhibition was above the standard of former years. The large groups produced keen competition. The cut blooms were very fair, and the vegetables and fruit were up to the average.

In Division 1, for groups of Chrysanthemums on a space not exceeding 50 feet, Mr. Keyser's (gr. Mr. Gleeson) group formed a striking feature of the show. This group not only took 1st prize, but also the Silver Cup, value £5 5s.

For miscellaneous group of plants, Mr. C. Van Raalte (gr. Mr. Neve) succeeded in carrying off the 1st award, whilst Lord Esler (gr. Mr. Brown) took 2nd place with a well-arranged group. For cut blooms, twenty-four incurved varieties, Mr. C. Van Raalte secured the 1st honour, Mr. H. H. Gibbs and Mr. Bosanquet (gr. Mr. Turk) being 2nd and 3rd. Mr. C. Van Raalte also took, amongst other prizes, the special prize given for the best Japanese bloom in the show, the 1st for twenty-four Japanese varieties, distinct; 1st for six incurved blooms, one variety; 1st for eighteen incurved blooms, distinct; 1st for six Primulas, 2nd for twelve Japanese blooms, and 2nd for eighteen Japanese blooms.

The special prize for the best incurved bloom in the show was taken by Mr. C. E. Keyser (the winner of the 1st prize for six Japanese blooms, one variety). The special prize for the twelve best Japanese blooms in the show was gained by Mr. H. H. Gibbs, who also obtained the special prize for six Chrysanthemum blooms, the 1st prize for six Cyclamen pots, and the 1st for twelve bunches of Pompons. Mr. J. Larkin (gr. Mr. Fortnum) was successful in winning the 1st prize for twelve incurved varieties, distinct, and 1st for twelve incurved blooms, distinct.

The 1st prize in Division 13, for a group of Chrysanthemums on 25 feet space, was taken by Mrs. Manning (gr. Mr. Chippe); Viscountess Malden (gr. Mr. Williams) being 2nd. Mr. Schrubber (gr. Mr. Davies) obtained the 1st prize for twelve incurved varieties.

Dr. Brett (gr. Mr. Camfield) was successful in Division 4, for a group not exceeding 20 feet, open to members not employing more than one gardener; Mr. W. E. Moon (gr. Mr. Hall) being 2nd. The other principal winners being Mr. Rowlands, Mrs. Part, Mr. T. F. Blackwell, Mr. S. J. Blackwell, the Earl of Essex, Mr. J. I. Ward, Mr. P. Bosanquet, Rev. K. F. Gibbs, Mr. W. T. Coles, and Mr. Blathwayt.

As on the previous occasion, Mr. A. Scrivener, florist, obtained all the 1st prizes for the wreaths and crosses that were awarded, as well as 1st for bouquet of Chrysanthemums.

The exhibits of fruit and vegetables were numerous and fine, but space will not permit of reference to them at full length, the chief prize-takers in the fruit being Rev. H. F. H. Burchell Herne, Mr. W. Knox, Darcy, Mr. H. H. Gibbs, Mr. R. Henty, and Mr. W.

F. D. Schreiber; whilst for the vegetables, Mr. A. Rowlands, Rev. F. H. Hodgson, Mr. G. W. Williams, Mr. Kentish, and Mr. Riley were the chief.

Mrs. Robins won the award for Mushrooms. Judges, *Chrysanthemums*:—Mr. Fyfe, Overstone Farm, Northampton; Mr. Herrin, Dropmore, Maidenhead; Mr. Lane, King's Ride, Ascot. Miscellaneous plants, &c.: Mr. Hill, Tring Park, Tring; Mr. Myers, The Grove, Watford; Mr. Norman, Hatfield House, Hatfield.

BRIGHTON AND SUSSEX NEW HORTICULTURAL.

NOVEMBER 7, 8.—The eleventh annual Chrysanthemum Show of this Society was held on Tuesday and Wednesday. From the first, the new management has been all that could be desired. Groups are always well staged at Brighton, and the prizes substantial, upwards of £25 being given for groups alone. In the premier class for cut blooms (thirty-six), a handsome silver cup, besides money prizes are given. There are some sixty odd classes, inclusive of fruit and vegetables, the majority of which were well contested, consequently the result was a grand show, notwithstanding the many claims of numerous societies upon the above dates. Both the Dome and Corn Exchange were filled with high class exhibits.

The following is a list of the chief prize-winners: *Plants*.—Semi-circular group (14 by 8 feet): 1st, Mr. H. Head, The Drive Nursery, Hove; 2nd, Mr. J. Hill, gr. to Marriage Wallis, Esq., Springfield, Withdeane. Both these exhibits were very good, and tastefully arranged.

Group (11½ by 6½ feet): 1st, Mr. F. Fairs, gr. to R. Clowes, Esq., Clayton Whickham, Hassocks; a grand lot of blooms, both in colour and size. 2nd, Mr. Sims, gr. to C. J. Inwood, Esq., Brighton.

For a group of similar dimensions, but to consist of only twelve plants, Mr. J. Turner, gr. to Sir Greville Smythe, Bart., Hove, was 1st, with a very pretty lot; Mr. G. Sims being a good 2nd.

Specimen plants were well shown, the chief prizes going to Mr. J. Hill, gr. to Marriage Wallis, Esq., and Mr. A. Scatt, gr. to Mrs. Jenkins. Well-grown specimens of *Primula* and *Mignonette* were also a feature. Six table plants, flower or foliage, in 6-inch pots, brought good competition, resulting in Messrs. W. Miles & Co., Brighton, and Mr. Goldsmith taking 1st and 2nd in the order named.

Cut Flowers.—In the cup class, for thirty-six Japanese, Mr. C. Ritching, gr. to Dr. Frankland, Reigate Hill, Surrey, had a splendid lot, his best blooms being Colonel Smith, E. Molyneux, Prince du Bois, W. H. Lincoln, Vivian Morel, and Charles Shrimpton; A. Slaughter, Esq., Steyning, was 2nd.

Twenty-four Japanese also brought forward some good blooms, the 1st and 2nd going to A. Slaughter, Esq., and Mr. G. Goldsmith, gr. to Sir E. Loder, Bart.; while the two premier prizes for twenty-four incurved varieties were awarded in the following order—Mr. Ritching and Mr. Goldsmith respectively.

A rather important class was that for twelve Japanese, Mr. S. Horscroft and Mr. Fowler securing 1st and 2nd with good blooms; but for twelve incurved, Mr. Fowler was 1st, and Mr. Horscroft 2nd, changing places. There were several minor classes, but our space prevents a more detailed report.

Baskets of Chrysanthemums were well shown by Messrs. Perkins & Son, Coventry, and Mr. G. Miles, Brighton, who were placed in like order. One stand for table also attracted much attention, Mrs. F. Rapeley, Withdeane, and Mrs. Osman, being 1st and 2nd.

Fruit.—Grapes, three bunches of white, 1st, Messrs. Johnson & Crook, Worthing; 2nd, Mr. Duncan, gr. to C. T. Lucas, Esq., Warnham Court. Three bunches of black, 1st, Mr. Duncan, with splendidly finished examples; 2nd, Mr. A. Kemp, gr. to C. R. Scrase-Dickens, Esq., Horsham. For four dishes of dessert Pears, Mr. Goldsmith had good fruit of *Glou Morceau*, *Burré Alexandra*, *Lucas*, *Burré Diel*, and *Doyenné du Comice*, which well deserved the 1st prize. Four dishes of dessert Apples resulted in Mr. Jacob being 1st, while Mr. Webster was a good 2nd. For a similar number of culinary varieties, Mr. Goldsmith and Mr. Jacob, Petworth, took the two chief prizes. Vegetables of all kinds were particularly good, but Leeks, Carrots, Onions, and Potatoes were of extra quality. Special prizes were offered by Messrs. Sutton & Sons, J. Cheal & Sons, W. Wood & Sons, and W. Miles & Co., which resulted in strong competition.

The most notable exhibits, not for competition, were those of Messrs. Balchin & Sons (fruit, bulbs,

Orchids, &c.), Mr. Tilley (bulbs and various horticultural sundries), and Mr. H. Stringer (wreath and bouquet), all of whom are leading firms in the town.

PUTNEY, WANDSWORTH, & DISTRICT CHRYSANTHEMUM.

NOVEMBER 8, 9.—The above Society held its annual show in the Cromwell Hall on the above dates, and taken as a whole it may be said to be quite equal to those of former years, but in common with the principal shows of the season there is a decided deficiency in the size and finish of the Queen section. Glancing along the tables the eye could not fail to observe the number of that excellent "Japanese," *Vivian Morel*, and in every instance it was in good form, which speaks much for its "doing" properties. Col. W. B. Smith, though not so frequently met with, was represented by some very fine blooms, its dark golden hues being conspicuous. Putney has always turned out some very choice groups, and this year there were five competitors for the Silver Cup (which by the way is a very handsome piece of workmanship), and in each case there was considerable merit in the growth and in arrangement of the same. That of Mr. Mynett, who claimed the trophy, was all that could be desired. Mr. French was 2nd, his group having a goodly number of the incurved flowers.

In the class for twenty-four incurved, Mr. J. Dark, gr. to J. Hooker, Esq., was 1st, his best being Mrs. Heale, *Violet Tomlin*, and *Princess of Wales*; he was followed closely by J. Portbury, gr. to W. N. Troy, Esq. The same exhibitor was placed 1st in the class for twelve, and had good representatives of Mr. Bunn and May Tomlin; Mr. S. Mynett, gr. to Col. Poe, C.B., was awarded the 2nd place, *Nil Desperandum*, *Jeanne d'Arc*, and *Lord Wolseley* being noticeable in his stand. In the class for six blooms, the latter exhibitor was 1st.

Mr. J. Portbury was placed 1st in the twenty-four Japanese, with a heavy lot of bloom, his *Vivian Morel*, *Boule d'Or*, *Gloire du Rocher*, *Vice-President Audiguier*, and an excellent flower of *Lord Brooke* making him an easy 1st; the latter bloom secured for him the prize for the premier Japanese in the Hall. The same exhibitor gained a like honour in the incurved section with a very fine flower of *Lord Alcester*; the 2nd prize went to W. J. Wright, gr. to H. A. Tuffnell, Esq.

In the class for twelve Japanese, Mr. J. Portbury was again placed 1st, followed closely by S. Mynett, Mr. C. Bently, gr. to Captain W. J. Bosworth, secured the prize for six bunches of *Pompons* in the amateurs' classes. J. W. Lambert, Alfred Jaas, and W. B. Rogers, were successful competitors, all showing neat blooms. Of single-handed gardeners, Mr. J. Dark, Mr. Bartley, Mr. Page, and Mr. Lambert, were again in the front.

The Silver Cup given for a group of eighteen plants went to Mr. J. Holmes; while in trained specimens, Mr. C. Bently and Mr. J. Portbury were the successful competitors.

Miscellaneous exhibits were numerous, and up to their usual standard, Apples, Pears, Grapes, and vegetables being shown in good character.

The 1st prize for a group of mixed plants arranged for effect was taken by Mr. J. Portbury; the same exhibitor taking 1st for six plants for table.

A pretty group of plants, arranged for effect, but not for competition, was contributed by Mr. J. F. McLeod, gr. to — Morgan, Esq., Dover House, Roehampton.

SCOTLAND.

NORTH OF SCOTLAND HORTICULTURAL AND ARBORICULTURAL ASSOCIATION.

At the monthly meeting of this association, held on October 18, there was exhibited by Mr. Wm. Ogg, gr. to Sir Archibald Dunbar, Duffus House, Elgin, a remarkable collection of fruit, comprising Apples, Pears, and Plums.

The Apples and Pears were of very large size, well-ripened, and of fine quality. The committee unanimously awarded the collection a Cultural Certificate with special commendation.

It may interest your readers to have particulars of Mr. Ogg's produce. It will give them an idea of what can be done in the genial, though far north climate of Morayshire, when favoured with a fine summer like the past one.

The fruit was grown in the open air without any artificial means being used. The varieties, weights,

and sizes, are as follows:—Apples: *Peasgood's Nonach*, largest six weighed 8 lb. 6½ oz.; the heaviest fruit 1 lb. 8½ oz., and measured 1 foot 3¼ inches in circumference. *Warner's King*, six weighed 6 lb. 15½ oz.; one heaviest 1 lb. 4½ oz., and measured 1 foot 2¼ inches in circumference. *Cellini*, six weighed 4 lb. 1½ oz.; one heaviest 14 oz., and measured 1 foot 1 inch in circumference. *Gospatrie*, six weighed 2 lb. 10 oz.; one heaviest 8 oz., and measured 10 inches in circumference. Pears: *Calabasse Grosse*, six weighed 9 lb. 9½ oz.; heaviest one weighed 1 lb. 12½ oz., and measured 12¼ inches circumference, by 9¼ inches longways. *Catillac*, six largest weighed 5 lb. 11½ oz.; one heaviest, 1 lb. 1½ oz., and measured 12¼ inches in circumference. *S. Venir du Congrès*, six weighed 6 lb. 13½ oz.; one heaviest, 1 lb. 4½ oz. *Sinclair*, six weighed 5 lb.; one heaviest, 14 oz. *Geo. C. Minty, Secretary*. [The above report has been unavoidably delayed. Ed.]

NORTH OF SCOTLAND ROOT AND VEGETABLE ASSOCIATION.

The twenty-third annual exhibition of this Association was held on Saturday, the 4th inst., in the Drill Hall, Inverurie, N.B. For many years this Association has occupied a very prominent position in the North of Scotland among associations of its kind, and, indeed, there is probably in Scotland no better organisation, or one that has been more productive of benefit in raising the standard of the quality of the products which its members have set themselves to advance and encourage. It has been extremely fortunate, too, in the gentlemen who have occupied the post of secretary. The members have also been very enthusiastic, and the prizes they have been able to offer have attracted competitors from a wide district. The show of Saturday was one of the best the Association has had for a number of years, both with respect to the number of the entries and the high quality of the produce shown. The exhibition had all the features which have hitherto rendered it so attractive. The entries were beautifully staged on white cloth, while the centres of the two main tables were very handsomely adorned with fine foliage and flowering plants, which, as has been the case for a number of years, Messrs. W. Smith & Sons, of Aberdeen and Kintore Nurseries, have supplied for the occasion without fee or reward.

The entries numbered 800, which is nearly 200 more than last year. There was a strong competition in both classes of Turnips, the special prize for best white Swedes going to Sir Robert Abercromby, Bart., of Forglan, while that for best yellows went to Mr. Reid, Cuthay. Potatoes, both field and garden, were a fine display, Mr. Ferguson, Linton House, carrying off the piece of plate with splendid specimens of Regents. Mr. James Paterson, Torrie; Mr. J. Lawson, Scotmill, Alford; and Mr. R. Cowie, Newlands, were also very successful.

Fruit was worthy of special commendation. An improvement may be suggested here, namely, that the varieties of Apples and Pears should be distinctly named. For baking Apples, of which there were some very fine dishes, Mr. G. Donaldson, Keith-hall; Mr. James Barron, Meldrum; and Mr. R. Grant, Pitfichie, carried off the premier honour. For best collections of dessert Apples, Mr. J. Barron and Mr. Gilchrist were 1st. For best collection of twenty-four Pears, Mr. P. Ogg, Fintray House, was well deserving of the chief place he held.

The collections of fruit forwarded were much admired; that sent in by Mr. A. Smith, Cullen House, coming in for a good deal of attention. Mr. P. Ogg, Fintray House, had also a 1st in this section. The vegetables were a grand display, and the prizetakers were the leading gardeners in the north of Scotland.

THE DINNER.

A dinner was held in the afternoon, at which Mr. Lumsden of Balmedie, presided. He was supported by Sir Arthur Grant, of Monymusk, Dr. Farquharson, M.P., and a large number of the leading county gentlemen.

ORCHARD-HOUSE CULTURE: THE PEAR.

THE fine garden of Martin R. Smith, Esq., Hayes Common, Kent, has become well-known for the choice Carnations it contains; but Mr. Blick, who grows the Carnations so well, is a good all-round

gardener, and successfully cultivates orchard-house trees in pots, the Peach, Nectarine, Plum, Cherry, and Pear. I wrote about the culture of the Pear in pots as an orchard-house fruit in the *Gardeners' Chronicle* many years ago, and pointed out that better fruit could be so obtained, than from wall trees under the best system of culture. Long before that, Mr. Rivers, of Sawbridgeworth, had shown how well Pears could be cultivated in an orchard-house built in the cheapest manner, and amongst amateur cultivators of a quarter of a century ago the highest award is due to George F. Wilson, Esq., for the splendid examples of Louise Bonne of Jersey, and other varieties he used to produce in the old garden at The Cottage, Weybridge. As an example of high-class cultivation, Mr. Blick sends me a photograph of six specimens of Pitmaston Duchess, the largest of them weighed 40 oz., and the united weight of the six turned the scales at 13 lb. 14 oz., or an average of 37 oz. Large flower-pots are not used, 12 and 13 inches diameter inside measure is a good average size, and for the rest good cultivation is all that is needed. I can quite understand some one saying, "What are we to understand by good culture?" Or, the question may be asked, "Is it necessary to grow Pear trees in pots at all?" I may say at once in answer to the last query, that they have been tried planted out in houses, and success has not followed this method of culture. The Peach and Nectarine may be so cultivated, but not the Pear. Therefore if the Pear has to be grown under glass, it must be under a system of pot culture.

Mr. Blick informed me that he keeps his trees in the house until the fruit is set, and they are turned out-of-doors in favourable weather in May; and the large specimens alluded to above were produced from a tree so treated. As the roots are confined to a very small quantity of soil, it is essential that it be good yellow loam, suitable to the growth of the trees, and to three parts of loam and one of good decayed stable manure is added; and to each barrow-load of loam an 8-inch potful of crushed bones; half-inch bones are best, as they keep the potting material in an open porous condition. A good grower does not want his trees prepared for him, although when time is an object, it is better to purchase the trees in pots; I would rather have trees that had been one year only under pot-culture than longer, but by preference I should choose well-rooted trees two years old from the nursery, and pot them up myself. If the trees have grown up from the first under the care of one cultivator, the chances of success are greater. After repotting the trees in November, plunge the pots containing them out-of-doors, quite over the rims of the pots in Cocoa-nut fibre refuse; this is excellent material for the purpose. Whenever the weather is mild, roots will push out freely during the winter, and by the time the trees are placed in the house in February they will be well established. Drain the pots well, and keep the drainage open; and in potting the trees, ram the compost well in with a wooden rammer, and do not fill the flower-pots too full—leaves about an inch in depth to be filled up with some rich surface-dressing when the trees are in growth in the summer. These surface-dressings give great vigour to the trees, and it is owing to them that the fruit develops to such a large size. Some persons may suppose that such large fruit is not of good flavour; but the proof of the Pear, as of the pudding, is in the eating of it, and all agree that the flavour of fruit grown upon such trees is excellent. *J. Douglas.*

LAW NOTES.

SANDER v. GREAT NORTHERN RAILWAY COMPANY.

The plaintiff, Mr. Frederick Sander, trading as Sander & Co., a nurseryman and Orchid grower, of St. Albans, sued the Great Northern Railway Company to recover £530 6s., the value of Orchids damaged in transit. It appeared that in July, 1892, the plaintiff sent a consignment, worth between £800 and £4000, of some 400 Orchids, together

with some Ferns, to the Horticultural Exhibition at Earl's Court, and that at Hatfield Station the truck containing the plants was run into, with the result that several were damaged. The defendants did not dispute their liability, but contended that the claim was excessive. Mr. Reid, Q.C., and Mr. Graham appeared for the plaintiff; and Mr. Murphy, Q.C. Mr. C. A. Russell, and Mr. Colville for the defendants. The jury returned a verdict for the plaintiff for £350.

VARIORUM.

CHRYSANTHEMUMS.

FALLING leaf and faded flower
Bring anew the autumn hour;
And the white mists earlier rise
Where the filling river lies;
Gathered is the golden grain:
But the gold flower comes again.

Blood-red sets the autumn sun
Now the year's best work is done.
Chillier beat the autumn rains
Falling on our colder veins:
But the season mocks the year,
For the blood-red bloom is here.

From "Musa Consolatrix," by Charles Sayle.

THE WEATHER.

[BY the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

- 0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S.
- Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending November 4, is furnished from the Meteorological Office:—

"The weather was again unsettled and changeable, with frequent rain, hail, or sleet in the north-west and north; but in the more southern and eastern districts, the earlier part of the week was fair and dry, and the rain experienced during the latter half generally slight. Thunder and lightning occurred at some of our southern stations during the night of October 30—31.

"The temperature was slightly above the mean in the 'Channel Islands,' and about equal to it in 'England, S.W.,' in all other districts, however, there was a deficit, ranging from 1° in 'England, S.' and 'Ireland, S.' to 4° in 'England, N.E.' and 5° in 'Scotland, E. and N.' The highest of the maxima, which were recorded on November 3, over England and Ireland, and on rather irregular dates in Scotland, ranged from 63° in 'England, S.' and the 'Midland Counties,' to 51° in 'Scotland, E.,' and to 47° in 'Scotland, N.' The lowest of the minima were registered during the middle part of the week, when the thermometer fell to 21° in the 'Midland Counties' and 'England, S.W.,' to 23° in 'England, S.,' and to between 25° and 28° in almost all other districts.

"The rainfall again exceeded the mean in 'Scotland, W. and N.,' and just equalled it in 'Scotland, E.,' in all other parts of the kingdom, the fall was less than the normal, the deficit being, in most cases, considerable.

"The bright sunshine showed an increase in most districts on that recorded during the preceding week, and exceeded the mean generally. The percentage of the possible duration ranged from 44 in 'Scotland, E.' and 41 in 'England, N.E.' and 'Scotland, W.,' to 26 in the 'Channel Islands,' 25 in 'England, S.W.,' and to 21 in 'Scotland, N.'"

MARKETS.

COVENT GARDEN, November 9.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. ED.]

PRICES rule as last week.

POTATOES.

Arrivals are not quite so heavy, and a better demand for good samples. Prices about same as last quoted, except for ordinary kinds, which are a drug on the market. *J. B. Thomas*

SEEDS.

LONDON: Nov. 8.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report to-day's market thinly attended, with scarcely any business passing. Cables from America quote red Clover seed somewhat dearer. For Winter Tares the inquiry still continues; very few, if any, will be carried over. Rye keeps steady. Linseed is quiet. Full prices are realised for Canary seed, and in view of the small and rapidly diminishing stocks, higher rates are shortly anticipated. Fine new Hemp seed is now obtainable at moderate figures. In Peas and Haricots there is no fresh feature.

FRUITS AND VEGETABLES.

BOROUGH: November 7.—Quotations:—Cabbages, 3s. to 5s.; Savoys, 4s. to 5s.; Cauliflowers, 5s. per tally; Turnips, 1s. to 1s. 6d.; Carrots, 2s. to 5s.; Parsley, 2s. to 2s. 6d. per dozen bunches; Onions, 5s. to 6s. per bag; Apples, 1s. 3d. to 6s. per bushel.

SPITALFIELDS: November 7.—Quotations:—Cabbages, 3s. to 5s.; Savoys, 4s. to 5s.; Cauliflowers, 5s. per tally; Turnips, 1s. to 1s. 6d.; Carrots, 2s. to 3s.; Parsley, 2s. to 2s. 6d. per dozen bunches; Onions, 5s. to 6s. per bag; English ditto, 5s. 6d. to 6s. 6d. per cwt.; Apples, 1s. 3d. to 6s. per bushel.

FARRINGTON: Nov. 9.—Quotations:—Carrots, 50s. to 60s. per ton; Parsnips, 60s. to 65s. do.; Sprouts, 2s. to 2s. 6d. per bushel; English Onions, £7 to £8 per ton; Apples, Blenheim, 4s. 6d. per bushel; cooking, 3s. to 3s. 6d. per bushel; Tomatos, English, 3d. per lb.; do., foreign, 3d. do.; Grapes, Almeida, 9s. 6d. to 10s. 6d. per barrel; do., English, 1s. to 1s. 6d. per lb.; Spanish Onions, 6s. to 6s. 6d. per case.

STRATFORD: Nov. 8.—There has been a good supply of all kinds of produce at the above market during the past week, and a brisk trade has been done at the undermentioned prices:—Cabbages, 2s. to 3s. per tally; Savoys, 2s. 6d. to 4s. 6d. per tally; Greens, 2s. to 2s. 6d. bunches; Cauliflowers, 1s. to 1s. 6d. per dozen; do., 5s. to 6s. 6d. per tally; Turnips, 1s. 3d. to 1s. 6d. per dozen bunches; do., 30s. to 40s. per ton; Carrots, household, 40s. to 45s. per ton; do., cattle-feeding, 30s. to 35s. per ton; Parsnips, 40s. to 60s. per ton; Mangels, 2s. to 2s. 6d. per ton; Swedes, 2s. to 2s. 6d. per ton; Onions, English, 8s. to 9s. per bag; do. Dutch, 6s. to 6s. 6d. per bag; Apples, English, 2s. to 4s. 6d. per bushel; Sprouts, 1s. 6d. to 1s. 9d. per half-sieve; Horseradish, 1s. 4d. to 1s. 6d. per hundle; Celery, 8s. to 10s. per dozen rolls; Beetroot, 6d. to 8d. per dozen.

POTATOS.

BOROUGH AND SPITALFIELDS: November 7.—Quotations ranged from 40s. to 110s. per ton—the prices of last week.

STRATFORD: Nov. 7.—Quotations:—Magnums, dark-land, 40s. to 45s.; do., light-land, 45s. to 60s.; Sutton's Abundance, 60s. to 70s.; Bruces, 50s. to 60s. per ton.

FARRINGTON: Nov. 9.—Quotations:—Main Crop, 80s. to 90s.; Sutton's Abundance, 70s. to 80s.; Bruces, 50s. to 60s.; Magnums, 45s. to 55s. per ton.

LONDON AVERAGES: Nov. 8.—Hebrons, 80s. to 110s.; Regents, 50s. to 80s.; Magnums, 40s. to 65s.; Champions, 45s. to 65s.; White Elephants, 60s. to 90s. per ton.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, best, 140s. to 155s.; new, do., 125s. to 145s.; inferior, do., 100s. to 120s.; Hay, best, 145s. to 170s.; inferior, do., 90s. to 100s. New Mixture, 115s. to 130s.; and Straw, 35s. to 58s. per load.

CORN.

Averages.—Official statement of the average prices of corn, imperial measure (quarter) for the week ending November 4, and for the corresponding period last year:—1893: Wheat, 27s. 4d.; Barley, 29s. 5d.; Oats, 18s. 2d. 1892: Wheat, 28s. 9d.; Barley, 27s. 7d.; Oats, 17s. 9d.

BOOKS: TABLE DECORATIONS: *Inquirer* and *S. T. Artistic Flower Decorations*, by B. C. Savard. Published at the Bazaar Office, 170, Strand, W.C. Price 2s.

CATTLEYA BLOOMS: *J. M., Rawdon Hill.* The blooms were all excellent, and especially so the one marked *C. labiata maxima*, Backhouse variety, and Nos. 1, 5, 6, and 7. The labellum in these blooms being finer in form or in richness of colour than in the other blooms.

CLIMBERS AND TRAILERS FOR SOUTH AND WEST WALLS: *Abdon.* The flowering plants may consist of *Calycanthus occidentalis*, *Chimodanthus fragrans*, *C. grandiflorus*, *Clematis candida*, Florida, Jackmani, lauginosa, magnifica, rubella, &c.; *Cianthus puniceus*, *Cydonia japonica*, *Edwardia microphylla*, *Jasminum officinale*, *J. revolutum*, *J. grandiflorum*, *Lonicera flexuosa*, *L. fuchsoides*, *L. sempervirens*, *L. Standishii*, *Magnolia conspicua*, *M. grandiflora*, *M. Lenne*, *M. purpurea*, *M. glauca*, *Passiflora cœrulea*, Fortune's Rose (the double yellow), *Rosa Banksia*, *Gloire de Dijon*, &c. The plants with evergreen or variegated foliage may consist of *Cratægus pyracantha*, *Coprosma Baueriana*, *Euonymus japonicus* in variety, green and variegated; *Hedera albotmarginata*, *H. algeriensis*, and *H. a. variegata*, *H. aureo-marginata*, *H. digitata*, *H. hibernica*, *H. h. aureo-maculata*, and many others.

DROUGHT AND THE SOIL: *S. S. W.* The investigations necessary for ascertaining the character of the chemical changes effected by the dryness of the past season would be too costly for us to undertake, and we are unable off-hand to say what those changes are, if any. That the soil has parted with less of its manurial properties, owing to the absence of rain, may be taken for granted; but there may have been more rapid decomposition of animal and vegetable matters within the soil.

EUCARIS BULBS: *Eucharis amazonica.*—The bulbs are quite unaffected by the bulb-mite, and the appearance noted in the foliage may be due to something in the air of the house, fumes from painted hot-water pipes, &c.

EXAMINATION IN AGRICULTURE: *S. S. W.* You would be obliged by the Science and Art Department to become well acquainted with the advanced stages before sitting for an examination in honours.

FRUIT ROOM: *G. M.* A room situated over horse-stables may be too warm and dry for the proper keeping of Apples, and you may have given too much air, making the evaporation of the juices of the fruit so rapid that the latter becomes shrivelled. The best kind of fruit room is one that is cool and rather damp, and to which just sufficient air is afforded to dissipate excess of moisture, much more for the first month after storing the fruit than is needful after that lapse of time. If you must retain the room as a fruit-store, darken it by putting close-fitting shutters over the windows; and if it be open to the roof, have it boarded over so as to form a ceiling, or employ thatch instead of tiles, &c. as a roof, and make use of no straw or hay in the room.

HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY: *Acorn.* The address of the secretary is W. Collins, 9, Martindale Road, Balham, London, S.W.

JERUSALEM CHERRY: *A. T.* It is not the custom for respectable English journals to insert editorial paragraphs relating to matters of which the editor knows nothing. Nor can we entertain your proposition to insert such a notice on the condition that you advertise in our columns; such a proposal is insulting.

LAMP-BLACK AND BOILED LINSEED OIL: *A. S.* This is the best coating for hot-water pipes.

LATE HYACINTHS: *W. L.* You have done right in placing these in ashea out-of-doors. When they have pushed about half an inch through the crown, remove them to a cold frame, but they must be protected from frost. Treated thus, you will have them until late in the spring.

MARKET FERNS: *G. T.* The strong-growing bluish-green Fern with golden yellow dust on the underside of the frond is *Phlebodium aureum*. *Woodwardia radicans* is also good for market.

MIDLE MARIE HOSTE: *A. T.* The flowers which you sent for our inspection were white ones, and we consider the judges did wrong in altering their decision.

MIGNONETTE: *E. B.* The word means in French little Mignon, ~~the~~ being the diminutive ending. There is no need for an *t*, as in the mis-spelling

Mignonette; nor of two *n*'s in the middle, another form of mis-spelling. The word is pronounced Meenōnett.

NAMES OF FRUITS: *W. A.* Some of your Pears were named in our issue for October 21, line 8. Some of the fruits were over-ripe before they could be dealt with, and we must remind you that you failed to observe our rules in two instances—first, in omitting to furnish your name and address; and secondly, in sending seventeen specimens instead of six, the number allowed at one time.—*C. H. S.* Your Grape is the Block Hamburg.—*J. T. A.* Apple not known—seems worthless.—*J. G. 1,* Warner's King; 3, Alfriston; 4, Rhode Island Greening; 6, Beurré Diel.—*No Letter*, fruit packed in tin box, the numbers written on tickets about the size of postage stamps. 1, Beurré Rance; 2, Beauty of Kent; 3, Tower of Glamis; 4, Passé Colmar; 5, Beurré Diel.—*H. H. 1,* Bergamotte d'Epereu; 1, Apple Dumelow's Seedling; 2, Scarlet Nonpareil; 9, Lane's Prince Albert; 4 Cox's Pomona?; 8, Beurré Rance?—*W., Subscriber, Hampstead.* 1, Over ripe; 2, Beurré Diel; 3, Glou Morceau; 1, Apple Rhode Island Greening; 2, Not known; 3, Court of Wick.—*W. W.* If not Lord Sufield, we know not what it may be; 3, Court Pendu Plat; 4, Striped Beefing.—*W. T.* Your Pear is not known—a worthless sort.

NAMES OF PLANTS: *J. W. B.* *Bupleurum fruticosum* (Umbelliferae).—*E. J., Botley.* *Datura Stramonium* Thorn Apple. Poisonous, but used medicinally in asthma, &c.—*A. S., Chester.* 1 and 2, *Tropæolum*, garden forms obtained from seeds; 3, *Bignonia venusta*, illustrated in *Gardeners' Chronicle*, March 1, 1879; 4, *Cyperus laxus*.—*W. F. & Son.* *Eulalia japonica*.—*R. M., Paisley.* *Odontoglossum Andersonianum*.—*A. H. H.* The white is *Dendrobium album*, the coloured *Lælia autumnalis Arnoldiana*, of gardens.—*Col. B. 1,* the old stems of *Dendrobium* such as you send pieces of should be cut off close down to the base, and in the same way all shrivelled old bulbs may be removed; 2, we should discontinue the daily sprinkling until the plants started into growth again; 3, the temperature of the house is correct for most of the species.—*E. S., Devonport.* 1, *Adiantum gracillimum compactum*; 2, *Pteris argyrea*; 3, *Adiantum trapeziforme*; 4, *Dieffenbachia nobilis*; 5, *Maranta albo-lineata*; 6, *Phyllanthus nivosus*.—*R. M.* *Forsythia suspensa*, probably.—*C. A. B.* *Cattleya Walkeriana*, of good colour, and a pale form of it valuable as a variety.—*J. H. H.* *Polemonium cœruleum*, variegated variety.—*Robert Birkbeck.* So far as we can tell from the acrop sent, it is *Eucalyptus citriodora*.

QUACK ADVERTISEMENTS: *B. J.* The advertisement to which you refer was cancelled immediately its nature became known, and the contract set aside at our risk. Every precaution is taken, but it is obvious that the publisher cannot know and cannot make investigations as to the good faith of all advertisers.

YELLOW AND DARK-COLOURED SULPHUR: *A. S.* Sulphur vivum or black sulphur is the cheaper kind, and it is as good for garden uses as the yellow kind. It is imperfectly purified sulphur, that is all.

PRUNING MADE SAFE AND EASY!
 THE STANDARD MANUFACTURING CO., DERBY, beg to announce that they have just completed several valuable improvements and additions to their already world-renowned series of Pruning and Horticultural Appliances. One is styled the "FULCRUM" Tree Pruner, which is capable of cutting a branch midway between the sizes that the "Standard" and Giant Tree Pruners will cut, and with the same ease and efficiency. Another is arranged to work with a spring and cord, enabling it to be in jointed sections any reasonable length. It can also be supplied without pole, an advantage if required for export. Our new Patent Combined Branch and Vine Pruner and Trimmer and Fruit Gatherer commends itself for being instantly adjustable for the double purpose. Also the new Patent "Easy" Weed Destroyer, for applying weed-killing compounds without stooping or soiling the hands. Illustrated Price LISTS of the above, and our other well-known Specialties in Pruning and Gardening Appliances, will be sent post-free by us or our Agents—The Principal Ironmongers and Seedsmen, the leading Stores, and kindred trades at home and abroad.

MESSENGER & CO'S New CATALOGUE of Greenhouses and Heating Apparatus, Will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glass-house, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kinds of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price, 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

MESSENGER & COMPANY, LOUGHBOROUGH.

ORCHID GROWER, or FOREMAN in the Houses.—Married; ten years' experience in Orchid, Fruit, Stove and Greenhouse Plants, especially Orchids.—G. MARTIN, Peans Rocks, Withyham, Sussex.

ROSE GROWER, inside or out.—Has been many years a successful exhibitor at the National and provincial Shows. Good references.—A. B. C., 8, Parliament Street, Small Heath, Birmingham.

To Nurserymen.

GROWER, or GENERAL.—Age 25; near London preferred. Nine years' experience in Soft-wooded and Foliage Plants, Roses, and Nursery Stock.—W. X., Gardeners' Chronicle Office, 41, Wellington St., Strand, W.C.

FOREMAN (GENERAL).—Age 26; ten years' experience in all branches. Good Plant and Fruit Grower. Good character and testimonials.—W. H. WATERS, Charlton Road, Keynsham, near Bristol.

FOREMAN, PROPAGATOR, or GROWER.—Age 33, married; well up in Growing Grapes, Tomatos, Cucumbers, Palms, Ferns, Aspidistras, and choice cut flowers, in quantities. Good experience in putting up new glass and hot water. Lifetime in the trade. Disengaged.—F. ARCHER, 14, Stamford Terrace, Stoke Newington.

JOURNEYMAN, inside; age 21.—W. WARD can with confidence recommend a steady and reliable young man as above.—The Gardens, Castle Malgwy, Llechryd, South Wales.

JOURNEYMAN, inside, or inside and out.—Age 22; seven years' experience in good Gardens and Nurseries. Good references.—F. WATERTON, Alma Cottages, George Street, Gt. Berkhamsted, Herts.

JOURNEYMAN, inside, under a good FOREMAN.—Age 23; eight years' experience. Leaving through a death.—F. BOURNE, Lindley Hall Gardens, Nuneaton.

JOURNEYMEN.—Mr. W. WHITE, The Gardens, Harefield Grove, Uxbridge, Middlesex, can with confidence recommend two young men as above. Ages 22 and 21 respectively.

JOURNEYMAN, inside or out.—Age 23; nine years' experience. Good reference.—W. E. SMITH, 84, High Street, Sydenham, S.E.

JOURNEYMAN, age 18, wishes for further improvement; has been under me three years. North of England preferred.—Mr. LEACH, Albury Park, Guildford, Surrey.

JOURNEYMAN (inside), under Foreman.—Age 21; six years' experience. Good references. Bothy preferred.—Premium offered.—W. HUBBARD, The Gardens, Springwood, Dartford, Kent.

JOURNEYMAN, in the Houses, under a Foreman.—Age 16; three years' experience.—G. COOTE, Letchmore Heath, Elstree, Herts.

IMPROVER.—Wanted, for Youth (age 18), a situation as above in a Nursery. Good knowledge of Garden. Shropshire or neighbourhood preferred; £4 premium offered.—VICAR, Brington, Whitchurch, Salop.

22 BONUS.—Situation wanted, by a youth (age 18), under a good Gardener. Steady, and industrious; willing to be useful. Total abstainer. Good character from last employer.—J. B., Prior's Court Lodge, near Newbury, Berks.

TO GARDENERS, &c.—Situation required by a young Man (age 23), abstainer and non-smoker. Slight experience. Good character.—W. F., 2, Sherwood Villas, Roxelle, Harrow.

TO GARDENERS.—Situation wanted by a youth (age 18), in large Establishment under good foreman. Twelve months character from previous place. Hon. Joseph Chamberlain, Highbury.—T. TWIGG, Dyham Park, Barnet.

To the Seed and Bulb Trade.

SHOPMAN, or ASSISTANT, Wholesale or Retail.—Age 24; seven years' experience. Good references.—TOM GREEN, Enville, Stourbridge.

THE FIVE ALLS.—The strongest lesson a well-known author ever had in political economy was derived from the signboard of a country public house. It was divided into four partitions. On the first was the figure of a king with the inscription, "I rule all;" the next was a portrait of a clergyman with the words, "I pray for all." Then followed the representation of a soldier with the legend, "I fight for all." Finally came a reaper and the words, "I work for all." The lesson would have been still more striking if there had been a portrait of Mr. Thomas Holloway, inventor of the celebrated Pills and Ointment, accompanied by the appropriate inscription "I cure all."

NEW ILLUSTRATED LIST Now Ready.

IMPORTANT.

I RESPECTFULLY beg to inform all readers of this Paper that the first edition (100,000 copies) of my Revised PRICE LIST, consisting of 400 Pages and about 1200 Illustrations, bound in cloth, is Now Ready. I shall have much pleasure in forwarding, in due course, to every person who has applied for a Price List up to Oct. 23 of this year, one post-free; and to all persons until Nov. 26 sending Three Stamps for postage, after which the price will be One Shilling each, Post-free. This List is the most Complete in the trade, and has cost several thousand pounds to produce.

P.S.—Persons who have applied for a List at any time during the year, need not write again, as I have names and addresses, and one shall be sent in due course.

CONTENTS OF SECTIONS.

SECTION.	PAGES.
I. CONSERVATORIES, GREENHOUSES, VINERIES, ORCHID HOUSES, PLANT AND FORCING HOUSES, FRAMES, FITS, HAND-LIGHTS, &c.	17-64
II. POULTRY, KENNEL, RABBIT, AND PIGEON APPLIANCES, &c.	65-98
III. RUSTIC WORK	99-134
IV. IRON BUILDINGS AND ROOFING, CHURCH FURNITURE, &c.	135-178
V. HEATING APPARATUS, COOKING STOVES, &c.	179-228
VI. HORTICULTURAL MANURES, FERTILIZERS, INSECTICIDES, WORM AND WEED DESTROYERS, SUNSHADES, SOILS, &c.	229-246
VII. LAWN MOWERS AND EDGE CUTTERS, TENNIS MARKERS, GARDEN ROLLERS, &c.	247-268
VIII. HORTICULTURAL TIMBER	269-280
IX. HORTICULTURAL SUNDRIES, WIREWORK, FOUNTAINS, VASES, STATUARY, &c.	281-342
X. VEGETABLE AND FLOWER SEEDS, PLANTS, LUTCH BULBS, &c.	343-383

WHY CAN W. COOPER SELL HIS GREENHOUSES, &c., CHEAPER THAN OTHER MAKERS?

I. Because he imports Timber in large quantities, and with the aid of special constructed machinery converts it into various shapes and sizes required for horticultural work himself on the premises, which no other horticultural builder is in a position to do. Can any timber merchant supply you with timber at anything near his prices? If any doubt, get estimates.

II. Because he imports Glass in large quantities, and has an agent who does nothing else but call on the manufacturers and buys up all parcels, large or small, at reasonable prices. Can any glass-merchant supply you on better terms than him? If any doubt, get estimates.

III. Because he has an Iron Foundry in the iron district and casts nothing else but his own boilers and pipes all the year round, and by this means can sell cheaper than any other firms who go in for all kinds of castings. Can you buy a boiler or complete heating-apparatus at anything near the price he quotes? If any doubt, get estimates.

You will see by the above that everything is bought direct in the cheapest markets, thus saving middleman's profits, and not having to go to the timber merchant for the timber, the glass merchant for the glass, and the foundry for heating apparatus, like other horticultural builders. Buy of the Original Inventor of Cheap Greenhouses. Do not pay 5 or 6 profits, but one only.

AMATEUR GREENHOUSES. SPAN-ROOF.

Deduct 10 per cent. if required for brickwork.

THESE GREENHOUSES ARE MADE especially for Amateurs at a nominal figure, thereby coming within the reach of those who require a strong but inexpensive structure, and being constructed in complete sections, can be readily erected by any handy man or gardener in a few hours. The framework is substantially constructed of real deal, the lower part being filled in with good, sound, well-seasoned, tongued and grooved matchboards. The houses are fitted with door complete, with rim lock and brass furniture, painted one coat of good oil colour, supplied with all necessary iron-work and stages for each side, and good 16oz. glass throughout. All parts securely packed, and put on rail; or delivered, erected, and glazed complete, within twenty miles of London Bridge, at the prices mentioned on each side.

MATERIALS for SPAN-ROOF CUCUMBER-HOUSE, 100 ft. by 12 ft., £9 10s., best Red Deal, all planed, rabbeted, &c., ready for use. Send for Specification. The above prices are for good sound Yellow and Red Deal. For large quantities special low prices will be quoted. All Timber consigned at the Cheap Timber Rate to all parts of the country. Send for TIMBER LIST.

"INVINCIBLE" HOT-WATER APPARATUS.

MOST EFFICIENT and CHEAPEST IN EXISTENCE. Made in six sizes: No. 1, to drive 75ft., £1 15s.; No. 2, 10 ft., £1; No. 3, 200ft., £5 10s.; No. 4, 275ft., £7 10s.; No. 5, 375ft., £8 10s.; No. 6, 500ft., £10; of 4in. pipes.

Requires no sunk stop-hole and no brick setting. Will last all night without attention. Will burn house-cinders, therefore costs next to nothing for fuel. Anyone can fix it. A child can stoke it. Success guaranteed. Cost of complete Apparatus for Greenhouses, with 4-inch pipes, flow and return along one side cut and fitted; so that if the internal measurement of the Greenhouse is given, the Apparatus will be sent completely ready for fixing, an advantage which will be appreciated by all. Securely and carefully packed on rail at the following respective prices:—7ft. by 5ft., £2 15s.; 9ft. by 6ft., £3; 10ft. by 7ft., £3 12ft. by 8ft., £3 5s.; 15ft. by 10ft., £4 5s.; 20ft. by 10ft., £5 5s.; 25ft. by 10ft., £6 5s.

SALES BY AUCTION.

Friday Next, November 24.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY, November 24, at half-past 12 o'clock precisely, by order of F. Sander & Co., a magnificent importation of

ODONTOGLOSSUM CRISPUM

(The true Pacho variety).

From the same woods whence came nearly the whole of the magnificent large white and splendidly spotted varieties now in cultivation, and imported by us. These woods were leased by us ten years since, so that we might secure for our customers this, the best and very finest of all types of crispum. The collector has just arrived home with a simply grand importation in superb masses, which are in the finest possible condition. From our previous importations. *Mirabile*, *Mardyanum*, *Cooksonianum*, *Ballantineanum*, *Sanderianum*, *Sanderae*, *Hrubyanum*, *Amesianum*, *apiatum*, and all the finest now in cultivation have flowered, and we recommend with the utmost confidence the present splendid lot. Also

CATLEYA BROWNII, n. sp., Rolfe.

Distinct and beautiful, combining the chaste and exquisite loveliness of *Loddigesii* with that of *amethystoglossa*. The plants have pseudobulbs resembling *Catleya Loddigesii*, excepting that they are larger and taller. It is evidently a very free-growing and free-blooming and most desirable new introduction.

The New *DENDROBIUM IMPERATRIX KRANZLII*; flowers rose, white, and purple.

The New *DENDROBIUM VERATRIFOLIUM*, Lindley, now introduced for the first time; flowers pure white.

The New *ONCIDIUM SANDERIANUM*, Rolfe, one of the grandest *Oncids* ever discovered.

The New *PERISTERIA ASPERSA*, Rolfe, vars. *aurantiaca*, *albida*, *purpurea*, and *atro-sanguinea*.

The New *MESOSPINDIUM GRANDIFLORUM*.

ONCIDIUM AUREOSUM SPLENDENS, O. HASTIFERUM, New *CELOGYNES*, *ONCIDS*, *ODONTOGLOSSUMS*, &c.

On view morning of Sale and Catalogues had.

Every Day.

DUTCH BULBS, GREAT UNRESERVED SALES.
5000 Lots Sold Weekly.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION at their Central Sale Rooms, 67 & 68, Cheapside, London, E.C., every day at 12 o'clock, large consignments of first-class *HYACINTHS*, *TULIPS*, *CROCUS*, *NARCISSUS* and other *BULBS* from Holland; also *ROMAN HYACINTHS*, *LILIUM CANDIDUM* and other bulbs for early forcing, allotted to suit the Trade and private buyers.

On view morning of Sale, and Catalogues had.

Bagshot.

HIGHLY IMPORTANT UNRESERVED SALE of beautifully-grown and well-rooted NURSERY STOCK, which has been carefully prepared for removal, and specially selected for this Sale, by order of Messrs. John Waterer & Sons, Limited.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, the celebrated Bagshot Nurseries, Bagshot, Surrey, within ten minutes' walk of the Bagshot Station, on TUESDAY NEXT, November 21, and TWO FOLLOWING DAYS, at 12 o'clock precisely each day, without reserve, several acres of NURSERY STOCK, grown to the greatest perfection, and exceedingly well rooted, comprising a variety of Conifers, splendid specimens, particularly adapted for effective planting; very fine Specimen Gold and Silver Variegated Hollies, 4 to 6 feet; 1000 Green Hollies, 3 to 5 feet; Aucubas, Laurels, very fine English Yews, 2½ to 3 feet, and 5 to 7 feet; Irish Yews, 3 to 4 feet; 2000 named Rhododendrons, 2 to 2½ feet, bushy plants of the best and newest kinds; Ponticum Rhododendrons in quantity, finely-rooted and bushy, and will move well; 1000 Spruce Firs, 2½ to 4 feet; and a quantity of larger specimens, 4 to 8 feet, specially adapted for Christmas Trees; 2000 Standard Ornamental Trees, 8 to 12 feet, including Purple Beech, 10 to 12 feet; 500 Limes, 10 to 12 feet; 500 Horse Chestnuts, 6 to 8 feet; 500 Scarlet Oaks, 6 to 8 feet; 1000 Black Italian Poplars, 8 to 12 feet. Thousands of Flowering Shrubs, large quantities of small Conifers for potting and boxing, and other Stock.

The Stock may be viewed any day prior to the Sale. Catalogues may be had on the Premises, and of the Auctioneers and Valuers, 67 and 68, Cheapside, London, E.C.; and Leytonstone, E.

Bagshot Station, being situate on the property, facilities are presented for the conveyance of purchases, and Messrs. John Waterer & Sons, Limited, will undertake to lift and despatch any goods bought at the Sale, simply charging for time and labour occupied. Purchasers can remove their lots at any time up to December 31, 1893.

Friday, December 1.—Special Sale.

CYPRIPEDIUM CHARLESWORTHII,
Rolfe, n. spec.

MESSRS. PROTHEROE AND MORRIS are instructed by Messrs. Charlesworth, Shettleworth & Co., Heaton, Bradford, to offer the above novelty by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on FRIDAY, December 1, at half-past 12 o'clock, together with several new ORCHIDS, from a quite new unsearched locality. Special attention is called to the fact that the plants offered are in exceptionally good condition.

From the information we have now received from our collector, there appears to be a great variety in size and colour of flowers, which is borne out by the distinct appearance of the plant.

See large advertisement in next issue.

Brockley, S.E.—Absolutely without reserve.
IMPORTANT CLEARANCE SALE, the land being required for extension of Lewisham Cemetery.

WORTH WAITING FOR.

My New Descriptive and Illustrated

CHRYSANTHEMUM CATALOGUE

IS NOW IN PREPARATION.

This will be the most useful and complete ever published, and will contain CULTURAL ARTICLES by Mr. C. E. SHEA and H. SHOESMITH. Also Names and Description of some of the FINEST NEW AMERICAN SEEDLINGS that have recently passed into my hands for distribution in this country; these consist of the pick of 35,000 Seedlings raised in the States last year, and they are unique in size, style, and colour, and will be necessary to every Exhibitor.

In addition, there will be SELECT LISTS of FINE NEW HAIRY VARIETIES of greatly improved form; also of English-raised and Continental varieties; as well as much other matter interesting to every Grower of the Chrysanthemum. This will be ready shortly, post-free for 7 Stamps.

Full particulars, with Plate, on application to—
JAS. IVERY AND SON, Nurserymen, Seedsman, and Florists, Dorking and Reigate.

PRUNING MADE SAFE AND EASY!

THE STANDARD MANUFACTURING CO., DERBY, beg to announce that they have just completed several valuable improvements and additions to their already world-renowned series of Pruning and Horticultural Appliances. One is styled the "FULCRA" Tree Pruner, which is capable of cutting a branch midway between the sizes that the "Standard" and Giant Tree Pruners will cut, and with the same ease and efficiency. Another is arranged to work with a spring and cord, enabling it to be in jointed sections any reasonable length. It can also be supplied without pole, an advantage if required for export. Our new Patent Combined Branch and Vine Pruner and Trimmer and Fruit Gatherer commends itself for being instantly adjustable for the double purpose. Also the new Patent "Easy" Weed Destroyer, for applying weed-killing compounds without stooping or soiling the hands. Illustrated Price LISTS of the above, and our other well-known Specialties in Pruning and Gardening Appliances, will be sent post-free by us or our Agents—The Principal Ironmongers and Seedsman, the leading Stores, and kindred trades at home and abroad.

CANNELL'S CHRYSTANTHEMUMS.

1,400 Varieties.

Completest and Best Kept Collection in the World.

From the advantages our having an abundance of room, country light and air, and every facility, we grow our Unapproached Stock in Pots plunged out of doors, cut down in September and housed in October. on solid stages close to the glass, for sending either as plants or cuttings all over the globe. The latter are now short, full of verdant growth, strong, and simply perfect. Totally different to sickly-coloured, drawn up under-growths a foot long. All warranted true, hence the universal saying, "None touch Cannell's." Our Duke of York and Golden Wedding are standard varieties, adding to our long list of the most permanent best kinds, and will be in every stand.

FERNS A SPECIALITY.

Our Stock is immense, consisting of over 1000 different kinds of Stove and Greenhouse Ferns, and over 400 kinds of Hardy Ferns. Every Fern Lover should have our ILLUSTRATED CATALOGUE, containing 150 Illustrations, price 2s. We forward our smaller Catalogue free on application. We now offer 12 beautiful kinds of Stove and Greenhouse, or Hardy Ferns for 3s.; 25 varieties for 8s. 6d.; 50 for 21s.; 100 in 12 varieties for 21s.; 100 in 25 varieties, 30s.; 100 in 50 vars., 40s.; 100 different kinds, 63s., all nice plants, larger at higher rates.

W. & J. BIRKENHEAD, F.R.H.S.,
FERN NURSERIES, SALE, near MANCHESTER.

NEW BORDER CARNATIONS.

MADAME DE FALBE. - Clear yellow, full flower, and perfect pod; stands well in the open border, the flowers remaining in good condition during weather that quite destroys the beauty of Germania. I was awarded 2nd Prize in Mr. Martin Smith's competition, at the National Show, Chiswick, although, owing to the very early season, the finest flowers had all been cut.

SOLENT QUEEN. - A seedling from Mrs. Reynolds Hole, possessing all the good qualities of that variety, with a perfect pod; colour deep yellow, flaked and striped with bright rose. This variety, unnamed, was in my 1st Prize Collection, at Earl's Court, 1892.

Very strong plants, 1s. 3d. each; 12s. per doz. Post-free, cash. CARNATION CATALOGUE on application.
EDWARD C. GOBLE, F.R.H.S., M.N.C.S., Walcot Nursery, Ryde, Isle of Wight.

600 ACRES.

FRUIT TREES.

See our ABRIDGED CATALOGUE of choicest and most profitable kinds only, which constitute the three essential points—viz., size, prolific croppers, and vigorous growers. No starvelings, stunted growth, or drawn-up rubbish. Every tree in our gigantic plantations has been transplanted, and true to name. 40,000 Standard and Pyramid Victoria Plums, Damsons, and Filberts—developed fruiting trees.

THIRTY ACRES FEATHERED PYRAMIDS, As grown on Lord Sudeley's extensive fruit farms, planted 3 yards apart, and 4 yards from row to row—form walls of wealth in fruits. We have supplied the chief American fruit farms, been awarded 9 Gold Medals, 72 First and Second Prizes, and 40 Certificates of Merit. 10 acres of Gooseberries, Currants, Raspberries, and Strawberries. 9,000 trees of Worcester Pearmain and Cox's Orange Pippin Apples very cheap, the land required for New Waterworks Co.

J. P. JONES & CO., Limited,

OFFER FOR PRESENT PLANTING

FINE CHESHUNT ROSES,

COMPRISING

POT ROSES—Teas and H.P.'s, said to be the finest in the country.

DWARF & STANDARD ROSES, STANDARDS magnificent, DWARFS on BRIAR of first quality. All new, choice, and scarce sorts.

GARDEN ROSES—The old-fashioned Moss and Provence, striped, and other Roses. The new Hybrid Teas and Noisettes of bizarre colours, Polyanthus, &c. See Rose show reports.

LARGE SPECIMEN HOLLIES and EVERGREENS.—Special offer of perfect Plants, green and variegated, for lawns and avenues.

HERBACEOUS PÆONIES—Special list of the best sorts, with hints as to culture.

PLANTS for Winter FORCING—Azalea mollis, from ground or in pots; Lilacs, new whites in pots; Amaryllis and Cannas, as finely exhibited.

Descriptive CATALOGUES of above posted to Customers; or, if not, of

PAUL & SON,
THE "OLD" NURSERIES,
CHESHUNT.

Specimen Palms,

TREE FERNS,

FOLIAGE PLANTS, &c.

B. S. WILLIAMS & SON

Respectfully invite the Nobility and Gentry about furnishing their Conservatories and Winter Gardens to an Inspection of their Immense Stock of Magnificent Specimen

PALMS, from 6 inches to 20 feet high.

TREE FERNS in any quantity from 1 to 15 feet high.

DRACÆNAS, from 1 ft. to 20 ft. high

CAMELLIAS, all sizes up to 12 feet.

AZALEAS, all sizes up to 6 feet.

RHODODENDRONS, Best and Pyramid shaped, all sizes up to 8 feet.

STOVE & GREENHOUSE CLIMBERS,
All sizes up to 12 feet.

CLIVEIAS, magnificent Specimens.

And all kinds of

FOLIAGE and FLOWERING STOVE and GREENHOUSE PLANTS in all sizes.

List of sorts, sizes, & prices forwarded on application.

VICTORIA & PARADISE NURSERIES,
UPPER HOLLOWAY, LONDON, N.

PAULS', WALTHAM CROSS,
For the Best Roses.

PAULS', WALTHAM CROSS,
For the Best Bulbs and Seeds.

PAULS', WALTHAM CROSS,
For the Best Fruit Trees and Grape Vines.

PAULS', WALTHAM CROSS,
For the Best Evergreens, Park and Roadside Trees.

PAULS', WALTHAM CROSS,
For the Best Camellias, Azaleas, Lapagerias, &c.

PAULS', WALTHAM CROSS,
South Entrance four minutes' walk from Waltham Cross Station, Great Eastern Railway.

West Entrance three minutes' walk from Theobald's Grove Station, Great Eastern Railway.

Inspection Invited. Prices Strictly Moderate.
Priced Catalogues Free.

Goods packed by experienced hands for all parts of the world.

Gardeners of character and experience recommended.

Observe the Christian name—

WM. PAUL & SON,

Rose Growers by Appointment to Her Majesty the Queen,

TREE, PLANT, BULB and SEED MERCHANTS,

WALTHAM CROSS, HERTS.

NEW WHITE CHRYSANTHEMUM

MDLLE. THÉRÈSE REY.

Head-quarters for this truly superb variety. Strong cuttings now ready, or orders booked for plants. I have a splendid stock of this, the best white in cultivation, bar none.

Prices, see CATALOGUE.

NEW CHRYSANTHEMUM,

CHARLES DAVIS.

Head-quarters for this sensational novelty. A sport from Vivian Morel. Colour rich rosy-bronze. An immense stock of splendid healthy cuttings now ready. Prices, see CATALOGUE.

NEW CRIMSON CHRYSANTHEMUMS,

WILLIAM SEWARD and JOHN SHRIMPTON.

Thousands of strong, healthy cuttings of these rare acquisitions now ready. Prices, see CATALOGUE.

NEW DECORATIVE CHRYSANTHEMUM,

YELLOW SELBORNE.

The entire stock of several thousand plants has been placed in my hands by the raisers, for distribution. Colour, a beautiful Daffodil-yellow. A true fixed sport from the popular variety, Lady Selborne. Prices, wholesale or retail, on application.

NEW CHRYSANTHEMUMS FOR 1894.

The following magnificent Novelties will be sent out from my Nurseries. (Orders now booked):—

H. SHOESMITH, | LA BELLE D'ALGIER
EDITH ROWBOTTOM, | MADAME CAMBON.

Also a complete Collection of Monsieur CALVAT'S unsurpassed Novelties, including the beautiful Incurved Japanese Louise, &c. See CATALOGUE.

NORMAN DAVIS,

CHRYSANTHEMUM NURSERIES,
LILFORD ROAD, CAMBERWELL,
LONDON, S.E.

THE

Gardeners' Chronicle.

SATURDAY, NOVEMBER 18, 1893.

HYGIENE.*

THIS is a collection of essays of varying scope and diverse character, but all tending to one end, the physical benefit of mankind. Most of them have seen the light before, as published lectures or magazine articles, but they are amply worth repeating in their present form. The subjects dealt with include the concentration of population in cities, the defects of some modern sanitary methods, the study of earth, air, and water in relation to sanitation, the practical experiences of the author in town, in country, the story of Bremon-tier, and lastly, the disposal of the dead. An appendix and an index materially add to the value of the book. Such is a general statement of the contents. It will be seen that the book has an interest for all of us. We may not agree in all points with the author, but we are in such full sympathy with his objects, that we cordially commend the work to the notice of the general reader, and especially to those in any way practically concerned in the subjects of which the book treats. It is, indeed, a book which every householder should study, and, so far as circumstances permit, act upon. We are not sure that the reasons cited by the author for the choice of the title "rural" are adequate. It may be true that in country places practical sanitary measures can be more scientifically and effectually carried out than they can in large towns where "circumstances" are so powerful in modifying or actually preventing their full application; but the fundamental principles must be the same in town or in country.

Much has to be sacrificed to expediency in towns, but has it not in the country also? Are parish vestries and rural sanitary authorities any less actuated by short-sightedness and self-interest (so called) than the corresponding bodies in urban districts? Is the desire to save the rate-payers any less keen in the country than in town? Are prejudice, ignorance, inability to understand or even to make the attempt to understand first principles any less potent in proportion to numbers in country than in town districts? We fear not. Is there no venality, no jerry-building in the country? or are those unlovely phenomena to be witnessed in crowded cities only? We fear there is a great deal of human nature, whether in town or country. Nevertheless, it is quite true that in many cases it is easier to put sanitary measures in practice in the country than it is in town, and this is probably all the author really means.

The evils arising from over-concentration of the population in large towns is, of course, insisted on; but if the suburban authorities could or would insist upon the due attention to sanitary

* *Essays on Rural Hygiene*, by George Vivian Poore, M.D., F.R.O.P., Longmans (1893).

precautions, would secure broad streets and a multitude of open spaces, besides instituting a rigorous examination of houses in course of construction, and periodical examination afterwards, then the evil effects of overcrowding would be largely obviated. The superior advantages and conveniences of the town districts, as compared with those in the country, would under the circumstances go far to counterbalance the evils of town life.

The pollution of air and water are evils whose magnitude is generally admitted. The author does well by showing that they are often evidences of waste and thriftlessness. So long as a thing is only a nuisance—ah, even a deadly nuisance—it is difficult to get authorities to move; but bring home to individuals that the resources of the breeches-pocket are squandered, and there is a better chance of mending matters. Even then, owing to divided authority, complex legislation, and the want of co-operation, it is vastly difficult to get the proper remedies applied. In the neighbourhood where these lines are penned there exist nuisances which are in some sense typical. A small stream meanders through the meadows, offering formerly delicious effects of scenery, a treasure-place for the naturalist. Kingfishers attested the presence of fish, the banks were lined with wild flowers, lovely Lilies reposed on the surface of the stream, and all this within a very few miles from London.

Gradual deterioration has been going on, increasing proportionately to the increase of population and the establishment of factories, till at length the stream is no better than a sewer, and in places, at times, an excessively foul one. In the same locality foul rubbish heaps and town refuse are "dumped" upon the borders of the canal, and these are sometimes burnt, so that the air is replete with stench sufficient to wake the sleepers at a distance of a mile or two, or more. Happily, of late years, no epidemic has been rife in the district, and it is difficult to prove that any individual case of illness is really traceable to one or other of the nuisances we have referred to. Moreover, there is the question of divided authority—the stink originates in one parish, its effects are felt in the next; there is an active Board in the one, a stagnant one, it may be, in the next district. The fear of cholera may induce the authorities to consider that "something ought to be done," but it takes a very long time even to arrive at that decision, and a very long time to carry it into effect.

Of course many of the topics touched on in Dr. Poore's book have special interest for our readers. The waste of good manure consequent on our present arrangements, the prevention of these changes in the soil which regulate the production of plant-food, the pollution of the air, and its cleansing by means of trees and foliage are all matters frequently discussed in these columns. "The bestowal of refuse is a problem which confronts every individual daily, and almost hourly. We may practically destroy it, so that our native soil gets no advantage, or we may start it upon a round of creative productiveness which will provide food, warmth, houses, and raiment, and in so doing find perpetual occupation for the increasing numbers of the unemployed." This passage is the key-note of Dr. Poore's book. He makes his points clear, thrusts them well home, and does his best to rouse the conscience of the individual, and the moral sense of the nation, for this is not only a physical and material question, it is a moral one—we do not think we should err if we said it was a religious one too.

Dr. Poore preaches what he practices, and by no means the least interesting portions of his book are those in which he narrates how he carried his principles into practice in a country town. We commend to our country readers the account of the manner in which Dr. Poore dealt with his cottage property. So far as the disposal of refuse of all

kinds is concerned, Dr. Poore's plan is to bury it immediately. The cottages are "scavenged" daily, the excremental matter and the ashes (as distinct from the cinders) buried superficially. The result is, that the garden produces all the ordinary fruit and vegetables in a state of perfection, which is clearly above average.

Other practical experiences in a London suburb are cited. Here, in addition to the use of earth-closets, the slops of all descriptions are daily utilised in the garden—the soil being stiff loam overlying brick-earth. How this is done effectually and without nuisance may be read in the book itself. The experience so gained only induces the author to repeat that "Refuse, if properly used, is a source of food and wages; but if improperly used, it merely leads to waste and starvation."

With the author's remarks on burial as opposed to cremation we are not so disposed to agree, believing that for large towns cremation is the method which secures the least amount of risk for the survivors, and, looked at without prejudice, it should be the least repulsive to their feelings, and ensure the greatest amount of reverence for the dead. Here, again, there is a marked difference in the necessities of the case, according to local circumstances. Ordinary burials—still more, burial in vaults or in coffins which do not speedily and readily disintegrate—are of course, from a scientific point of view, utterly objectionable; they can scarcely fail to become equally so from a sentimental point of view, when people can allow themselves to think as well as to feel.

Not to conclude with so gruesome a subject, we may mention that one of the chapters in Dr. Poore's book is devoted to the story of Bremon-tier, and how he made the wastes of Gascony to flourish by the planting them with Ploaster. Instead of uselessly attempting to fight the sand, he utilised it in a manner now familiar to most of our readers. We must also not omit to take note of the appendix on market gardening—the only branch of agriculture which is in a prosperous condition. Ordinary readers are little aware of the enormous extent and value of this system of cultivation. We ourselves, though previously familiar with the matter generally, were surprised at the magnitude of the results we had the opportunity of publishing in the spring, in connection with the representations then made to the Board of Trade in connection with the revision of the railway rates. Those details, and the reports of visits paid at our instigation to several of the principal establishments near London, should be carefully considered alike by sanitary reformers and statesmen.

NEW OR NOTEWORTHY PLANTS.

COLEUS PENZIGII, Hort. Dammann.

THERE are a great many species of Coleus in Tropical Africa, several of which have not yet been anywhere described. In many of them the cymes are compound, but the present plant belongs to the set in which the cymes are congested into umbels, and the leaves are not at all fleshy. It has just flowered at Kew, where it was received not long since from Messrs. Dammann. I presume it is one of the plants discovered by Prof. Penzig, of Genoa, during his recent expedition to the mountains of Abyssinia, a large collection of which I saw growing at Mr. Thos. Hanbury's garden at La Mortola two years ago. Coleus only differs from *Plectranthus* by its united stamens.

A herbaceous perennial, with stout stems clothed with fine spreading hairs. Leaves ovate, 2 to 3 inches long, crenate, green, pubescent, especially beneath, narrowed suddenly to a winged petiole. Whorls simple, eight-flowered, forming a lax raceme 6 to 8 inches long; bracts small, deciduous;

Coleus Penzigi, Hort. Dammann.—Herbaceous, perennis, caulis subtiliter pilosis; foliis ovatis crenatis breviter pubescentibus in petiolum ad basin alatum ciliis angustatis; verticillis simplicibus 8-floris in racemum laxum dispositis; bracteis minutis caducis; calycis tubo campanulato piloso dentibus deltoides breviori; corollæ tubo diffracto; labio inferiori magno cymbiformi pulchre violaceo.

pedicels $\frac{1}{2}$ to $\frac{3}{4}$ inch long. Calyx $\frac{1}{2}$ inch long; tube campanulate, very hairy, shorter than the unequal deltoid teeth. Corolla tube bent suddenly at the middle; lower lip deeply cymbiform, bright violet, $\frac{1}{4}$ inch long; upper much smaller, reflexed. Stamens concealed in the lower lip of the corolla. *J. G. Baker.*

THE CHESTNUT OAK.

QUERCUS PRINUS is by no means a new-comer in our midst, but for all that, it is not nearly so often seen as its merits warrant. A specimen sent to us from the Duke of Northumberland's pleasure-grounds at Albury, near Guildford, has induced us to have an illustration made (fig. 101). It is a handsome deciduous or nearly evergreen tree of large size. The general form of the leaf is well shown in the cut; in texture it is firm, rather thick, and of a rich green colour. The shortly-stalked acorns are rather large and pointed, of a bright shining brown, set in a tubercled downy cup. The species is very variable, hence many names have been given to it, and much difficulty is experienced in sharply defining the varieties. It is sometimes called *Q. Mirbeckii*, though we do not find that name in any authentic list at our disposal. Perhaps *Q. Michauxii* may have been intended, a species sometimes considered as a form only of *Prinus*. *Q. Prinus* has a wide distribution in the Atlantic states, extending from Massachusetts to Ontario, and south to Alabama, and west to Kentucky and Tennessee. According to Sargent, the bark of this Oak is preferred to that of other white Oaks for tanning purposes.

Why the name *Prinus* came to be attached to an American tree is not obvious. The Greek *prinos* is generally considered to have been the Evergreen Oak, *Quercus Ilex*.

LILIES AT KEW.

The systematic cultivation of Lilies on a large scale at Kew is a somewhat recent development of the outdoor gardening in that establishment. Formerly many attempts were made to grow them in specially-made beds in that portion of the gardens devoted to the cultivation of monocotyledonous plants, but these all failed, and so—with the exception of a few species which thrive even under the most depressing conditions—Lilies played little or no part in ornamental gardening at Kew until within the last six or eight years. The success which has attended the new departure, and the wonderfully fine effects produced by masses of the showier species and varieties, are so great that an outline of the methods pursued may be of general interest.

Most of the Lilies at Kew grow well in peat; some few refuse to grow in peat, but do well in loam; some do equally well in loam and peat. But, generally speaking, the key-note of success was struck when the bulbs were planted among low-growing shrubs. Behind the Palm-house is the so-called "American Garden," containing masses of Ericaceous and other plants in large beds; among these are Rhododendrons—low-growing species—Azaleas, Ledums, Callunas, Ericas, Pieris, Leucothoë, Daphne, &c. These shrubs serve a double purpose: they keep the ground cool about the Lily roots and shelter the young growths from the late spring frosts. Every few years, as the shrubs grow too dense, it is necessary to replant them and space them out properly, so as to give the Lilies a fair share of light and air. Replanting, by the way, is better than pruning, as each time replanting takes place a number of fine shrubs are obtained, which are available for new plantations. At the same time, the Lilies—at any rate, the great majority of them—pay for being lifted and replanted, the smaller bulbs being retained and placed in nursery beds to grow on. *Lilium auratum* is one which prefers being let alone, and, given a well-drained peat bed, should not, if possible, be disturbed. *L. auratum*, by the way, being a taller grower than most of its congeners, we grow in beds of taller Rhododendrons than those which find a place in the "American

Garden," and these can from time to time be pruned in so as to allow the Lilies light and breathing space. In the beds of Rhododendron—principally hybrids of *R. ponticum*—along the Broad Walk we have had hundreds of stems of *L. auratum* 6 feet high (many have attained 8 feet or more), with fifteen to twenty, or even more, perfect flowers. This year, however, owing to the excessive drought, few stems have attained the dimensions or have produced the number of flowers just mentioned. *L. longidorum* does best with us in peat, and must be replanted every second or third year, or there would

lived. An excellent way to keep up a stock of young vigorous bulbs is to make a sowing every year. If treated properly, seedlings arrive at the flowering stage very quickly. The seeds should be sown as soon as ripe—if possible, in prepared beds (not in pots or pans) under glass. A cold frame will do well, but results are more speedily attained if seeds are sown in a bed in a slightly-heated greenhouse. For instance, seeds of *Lilium longiflorum* var. *formosana*, a beautiful variety from Formosa, developed rapidly, some seedlings flowering in little more than a year from time of sowing. The bulbs in that time

bulbil, all that is necessary with the Tiger Lily being to sow the bulbils when ripe in the open ground and leave them to their fate. A slight covering of Fern leaves, &c., during winter is, however, beneficial. With *L. sulphureum*—owing to its being much more uncommon—we act differently, planting the bulbils in pans or beds under glass. The first year these will get as large as small Hazel nuts—after this they are better planted outside; some planted out this spring in an Azalea bed, fully 6 inches deep, have grown freely this past summer, producing numbers of bulbils, which, in their turn,

FIG. 101.—*QUERCUS PRINUS*—THE CHESTNUT OAK: SUB EVERGREEN. (SEE P. 616)

be a falling-off in the size and number of the flowers. The fact is, the bulbs increase so fast that they crowd each other out and impoverish the ground; the small ones are planted at once in other beds or are grown on in nursery beds for stock. *L. speciosum* and its numerous varieties increase so rapidly that they quite exhaust the ground; replanting is necessary every second, or third year at the outside. Fresh peat should be added, and only some of the large bulbs replaced; the others may be at once utilised for forming new plantations.

The bulbs of some Lilies, after flowering well for several seasons, disappear apparently without cause, and the better and the more freely they have grown and flowered the more apt are they to disappoint their possessors. It seems probable that the bulbs of these kinds are in reality always rather short-

had attained about the size of small Hazel-nuts; last year they were planted in the open ground, and during the past summer have flowered profusely.

The former method of propagation—when seeds are not to be had—is one which allows the stock of a given kind to be rapidly increased. A good-sized bulb will furnish a large number of scales, each of which may develop into a good bulb in two or three years. The scales should be planted in silver sand, over prepared soil, and kept in a frame or greenhouse until young plants have developed, when they are better planted out in the open ground. The third year from scales we have had *L. Hansoni* 5 feet high, bearing from nine to twelve flowers on a stem. Bulbils, as of the Tiger Lily (*L. tigrinum*) and *L. sulphureum*, furnish an easy way of propagation; the former will flower the second year from the

will be carefully treated as above described. They will doubtless flower well next year.

The Martagon Lily (*L. Martagon*) and its varieties *album* and *dalmaticum* will not grow in peat at Kew, but do well in loam. The Tiger Lily (*L. tigrinum*) and its varieties, although they will thrive in peat, do well in almost any garden soil. The Pyrenean, or Yellow Martagon, as it is sometimes called, requires loam; if chalky in character so much the better. *L. testaceum* and *L. candidum* like good loamy soil. *L. pardalinum* grows very freely in a damp loam; the third year we have had it 7 feet high, with thirty flowers on a stem. When this species is transplanted, unless clumps are moved with masses of soil attached to their roots, it is never so fine the succeeding year; one must wait until it is thoroughly established before the best

results are obtained. *L. Hansonii* will grow well even in a hot dry spot. The scarlet Martagon, or scarlet Turk's-cap, *L. chalcidonicum*, and its varieties, like a moist, but well-drained, good strong loam; this is not an easy species to manage, but where it does succeed it is one of the most beautiful of hardy Lilies. *L. croceum* (the Orange Lily) does better in loam on a damp subsoil than in a bed, no matter how well prepared, on a dry gravelly or sandy subsoil; it is a beautiful plant, and by no means common in gardens. *L. davuricum* and the numerous forms of the garden *L. umbellatum* thrive admirably in almost any garden soil; among dwarf-growing shrubs, as recommended at the commencement of these notes, the bulbs increase in size and number to such an extent that, although planted originally 6 or 8 inches below the surface, in about three years they will almost lift themselves out of the ground. The Chinese *L. Henryi* grows in both peat and loam; in peat, two years after planting, the stems measured 5 feet in height, and bore as many as nineteen flowers; in loam, however, the second year after planting, the stems had attained a height of 6 or 7 feet, and some bore upwards of thirty flowers. *L. candidum*, as far as Kew is concerned, is one of the most refractory of Lilies; imported bulbs flower well the first season, but afterward, as a rule, fungoid disease attacks stem and leaves, and both dry up and wither before the flowers open. *L. longiflorum* will grow well either in loam or peat, and *L. Szovitzianum* likes loam with a clay bottom.

First and foremost is the Golden-rayed Lily of Japan (*L. auratum*), which has already been mentioned. *L. superbum*, a noble species, with which doubtless our American readers are familiar in a wild state, does best in peat with us; the second and third year after planting it has reached 7 feet in height and upward, bearing from twenty to thirty flowers on a stem. Some seasons many of the bulbs will remain perfectly dormant, but the following season they will start again. *L. Grayi*, from Roan Mountain, does not, as far as my personal observation and inquiries on the spot go to prove, ever attain anything like the proportions in a wild state that it does at Kew. We have had our bulbs since 1891; they were planted early in that year in a bed of *Azalea amona*, and most of the stems bore but one flower; the following year the flowers numbered from two to five on a stem, the present season the stems have grown 5 feet high and borne from five to twelve flowers each. The little Japanese *L. concolor* (bright scarlet) and its variety, *Coridion* (bright yellow), the second year after planting among dwarf *Azaleas* have grown 2 feet high, and borne from four to six flowers on a stem. *L. speciosum* and its varieties like peat, but soon deteriorate unless replanted and the smaller bulbs removed; with this species not more than two years should elapse without replanting. If arranged in clumps among low shrubs it is easy to move the clumps 1 foot or 2 feet, and so obtain fresh soil for the hungry roots to work in. The second year after planting we have measured *L. speciosum*, and found the stems to be 5 feet high, bearing from twelve to twenty flowers. *L. canadense*, *L. elegans* and its numerous forms, *L. Brownii*, *L. japonicum*, *L. pomponium* and *L. sulphureum* are other Lilies which, in Kew at least, do best in peat. *George Nicholson, Kew, in "Garden and Forest."*

HONEYDEN, FOOTS CRAY.

Few gardens can boast of such a great variety of plants cultivated in them as are here to be found, or which benefit by such skilful supervision as Mr. R. A. Todd, the proprietor, gives to the cultivation of his favourite flowers. Hardy plants, bulbs, and especially Irids and Amaryllids, Lilies, Orchids, and Ferns form the larger part of the plants grown; and in every part of the garden, outdoors and in, there is a great number of odd plants, and especially of beautiful species, which need in former times to be more cultivated than at the present time. In a natural hollow, grass-clad, beneath the shade of trees and shrubs, little gardens are arranged, in which

the various Lilies, and especially *Lilium superbum*, *L. canadense*, and *L. pardalinum*, grow and bloom remarkably well. In another bay are *Ericas*, *Menziesias*, *Pernettyas*, and similar plants; further on are clumps of the various species of hardy *Cypripedium*, which thrive in a most satisfactory manner in the cool moist places prepared for them. In another place a collection of the *Oncoclycus Iris* is found, which, now that they are getting established, promise to bloom well.

Forming a garden in itself is a sheltered nook, in which are beds furnished with rockery, among which dwarf-growing alpine plants are planted, which are always giving a more or less good show of flowers; indeed, with these plants, if only a suitable situation can be found in which they will grow well, the production of numerous flowers is certain. The length of time which some of the neat little alpines last in bloom is truly marvellous. The border around is planted with the stronger and taller-growing species, the collections of alpine plants being kept together as much as possible. On one side is a collection of the species of *Eremurus*, which are such stately objects when in bloom; and in another part a collection of *Helleborus*, and so on through most of the favourite genera. The edging plants in many cases consists of species of *Crocus*, *Chionodoxa*, *Scilla*, and other dwarf bulbous plants. With bulbs Mr. Todd is very fond of experimenting, and he has succeeded in growing some in the open air which are generally regarded as inmates of the greenhouse or stove. Planted deep in the soil close to the wall of one of the plant-houses are several species of *Crinum* which have proved quite hardy, in addition to *C. longifolium* and *C. × Powellii*, which are generally admitted to be hardy. Among the former were noted *C. Moorei*, *C. longiflorum*, a Jamaica species; *C. campanulatum*, and a probably new *Crinum* from the Zambesi district. It is near to *C. lineare*, and bloomed well last summer, and now seems to be in the right condition to go to rest. With these and other reputedly tender bulbs, deep planting is found to be the chief condition for ensuring success.

The Orchids form an interesting collection, fairly divided between the showy flowering and the curious or botanical genera. The *Cattleyas* and *Lælias* are well grown; the panfuls of *Diasas*, including *D. racemosa* and *D. tripetaloides*, are very vigorous, and, indeed, with but one or two exceptions, everything was doing well. The *Phalenopsis* here, as in many other gardens, are the least satisfactory, but their condition is attributed to their being necessarily shifted about while new glass-houses were being built, and while the painting of the same was in progress. It is only a portion of these plants which is not in good health, viz., the *P. amabilis* and *P. grandiflora*; *P. Schroderiana*, *P. sumatrana*, and others of that class being in good condition, *Schroderiana* and *sumatrana* being in flower.

In the cool-houses, we found *Odontoglossum lunnewellianum*, a number of *Cypripedium insigne*, *Cologyne fuliginosa*, *Oncidium cheiroporum*, *Lælia præstans*, fine pans of *Pleione Wallichiana*, *P. lagenaria*, *Oncidium varicosum*, *Sophrontia cernua*, the pretty *Masdevallia calura*, and other species in flower; while in the large range of three divisions we found among the genus *Catasetum*, which is a favourite one with Mr. Todd, *C. integerrimum* and *C. purum* in flower, other well-bloomed species being *Rodriguezia secunda*, *Angræcum Scottianum*, *A. Saundersia*, *Cattleya guttata*, several good *C. Bowringiana*, and many *C. labiata*, *C. Harrisonæ*, *Lælia furfuracea*, with three spikes; *Cologyne Massangana*, *Cymbidium Mastersii*, *Sarcantbus teretifolius*, *Arundina bambuseifolia*, *Dendrobium formosum*, *D. Dearii*, *D. Phalenopsis*, *Coryanthes maculata punctata*, in bud; and fully in bloom one of the most beautiful and largest forms of *Vanda Sanderiana* we have ever seen, and remarkable for the unwonted richness of its colouring.

In the other houses, we found in one a showy and interesting collection of *Nerines*, both species and hybrids, among those in bloom being *N. pulchella*, with five flower-spikes; a large form of, or

hybrid of, *N. undulata*, &c., with seven spikes; *N. curvifolia*, *N. cornuca*, *N. cornuca major*, *N. pudica*, *N. × O'Brienii*, in many varieties; two distinct forms of the new white *N. pancratioides*, one with scapes 2 feet 6 inches in height.

Other bulbs in bloom were the rare *Hæmanthus crassipes*, *Anoiganthus luteus*, *Cyrtanthus lutescens*, the delightfully fragrant *Maessonia amygdaloides*, *Gladiolus breviflorus*, *Schizostylis coccinea*, and a very fine *Oxalis*, larger than *O. Bowiei*, which Mr. Todd brought from Madeira.

Roella ciliata and other New Holland plants are in bloom, and in the conservatory when *Dendrobium splendidissimum grandiflorum*, *D. nobile nobilissimum* and other deciduous *Dendrobies* have ripened up fine bulbs, there is a show of *Chrysanthemums*, *Epacris*, *Cassia corymbosa*, *Trachelium cœruleum*, a fine *Brugmansia sanguinea*, with red and yellow blossoms; and suspended were some rare greenhouse Ferns such as *Pellea atro-purpurea*, *P. tenuifolia*, *Nothochlæna Marantæ*, and other *Nothochlænas* and *Cheilanthes*.

ORCHID NOTES AND GLEANINGS.

VANDA SANDERIANA.

This remarkably showy Orchid is now in flower in the Orchid-house in the Birmingham Botanical Gardens, displaying six fine expanded blooms. The plant is growing in a suspended earthenware basket. *W. D.*

NOTES FROM BELVEDERE, HARROGATE.

A NEW range of glass, erected in the gardens of C. B. Faber, Esq., Belvedere, Harrogate, which I was enabled to inspect recently, consists of eight separate houses, having span-roofs which are in the alignment of north to south, and connected at the northern end by a span-roofed corridor of 164 feet in length and 9 feet in width.

On entering the corridor from one of the ends, a fine lot of *Chrysanthemums* was remarked, and hanging from the roof festoons of *Solanums*, *Jasmines*, *Roses*, and other climbers; the varied flowers of the *Chrysanthemums*, and the foliage of the climbers making pleasing pictures.

One of the houses is a small stove, and whose floor was lower than that of the corridor, the plants in it being chiefly *Crotons* and *Dracænas*. Cool Orchids filled another house, also with a sunken floor, and consisted of *Odontoglossum crispum*, *O. Alexandræ*, *O. Peacatorei*, *O. Halli*, *O. grande*, and other species, besides *Oncidium tigrinum*, *O. macranthum*, and other *Oncids*.

A house is set apart for *Cattleyas* and *Cypripediums*, and it contained healthy specimens in bloom, of *Cattleyas labiata* and *C. Mossiæ*; *Cypripedium Spicerianum*, *C. Leeanum superbum*, *C. Chantini*, *C. Dauthieri magnificum*, *œnanthum superbum*, *Arthurianum*; and a fine piece of *Vanda cœrulea* carrying six flowers.

The stove proper contained large specimens of *Crotons* and *Dracænas*, viz., *Croton Queen Victoria*, *C. Baron Jas. de Rothschild*, *C. Mortii*, *C. Thompsoni*, *C. Aighurth Gem*, besides a number of smaller plants.

The conservatory which forms the middle of the range contained many specimens, *Kentias*, *Araucaria excelsa*, *Seafortia elegans*, &c. Two houses are devoted respectively to the forcing of Peaches and Vines. The last house in the range was constructed with special regard to the cultivation of *Nepenthes*, *Anthuriums*, and other plants which require much humidity and warmth. Amongst *Nepenthes* were observed in fine condition *N. Mastersiana × N. Dicksoniana × N. coccinea*, *N. Hookeriana*, *N. Cheloni × (carrying twelve pitchers)*, *N. Wrigleyana ×*, and *N. Outramiana ×*. To meet the requirements of the plants an oval tank has been built in the middle of the house, the walls being level with the floor, and the top of this tank rests on pillars

which raise it just above the water-level. Above it large specimens of *Nepenthes* are placed, and across it are thrown strong iron arches furnished with arms on which baskets containing *Nepenthes* are suspended. The centre of each arch stands about 4½ feet from the water-level. The floor is of tiles, and the command of heat is ample. Judging by the healthy appearance of the plants, the fittings of the house exactly meet the requirements of the plants. In a range of cold pits, were noticed excellent *Souvenir de la Malmaison Carnations* that had flowered well this season. It may be mentioned as an unusual accessory to the glass structures that the whole of the houses are furnished with electric light apparatus. The healthy appearance of all the trees, vines, and plants reflect much credit on Mr. Townsend the gardener, to whom every encouragement is given by his employer, Mr. Faber being a great admirer of plants generally, and especially of the cool-house Orchids, *Nepenthes*, and *Anthuriums*. *J. Clayton.*

THE FUTURE DEVELOPMENT OF THE VIOLA.

To many the most interesting phase of *Viola* culture is the raising of seedlings. Recently, when lecturing on a kindred subject to the National Amateur Gardeners' Association, I was asked by Mr. Crane, the secretary, to advise the members on what lines to work for the improvement of the *Viola*. It was rather a large subject to deal with off-hand in a satisfactory way, and I have often thought since it is a subject well worth a somewhat extended treatment in your columns. The following groups of *Violas* will require to be treated separately: whites, pale yellows, deep yellows, light blues and lavenders, dark blues or purples, rose and blush coloured, and fancies, the latter say in four sections—striped flowers, white flowers with coloured edgings, yellow flowers with coloured edgings, and those of the Countess of Kintore type. It will be generally admitted, I believe, that the varieties I have selected as being the best in their respective colours are really the best. I admit at once that there is room for difference of opinion in some cases, but those named serve the purpose intended better than any others I know.

SELFS.

Whites.—Countess of Hopetoun, Countess of Wharndcliffe, and *Sylvia* are three of the best. The habit of the Countess of Hopetoun is perfect, and that of *Sylvia* is also very fine; but their flowers are rather thin. The flowers of Countess of Wharndcliffe have great substance, are scented, and therefore what should be aimed at is to get these qualities associated with the habit of, say, the Countess of Hopetoun.

Pale Yellows.—Ardwell Gem, Bridesmaid and Lemon Queen are the best, and the latter has a most excellent habit, but what it lacks is refinement in the flower. The habit of Bridesmaid is defective. It has a slight perfume. Something good ought to be got by crossing Lemon Queen with either of the other two.

Deep Yellows.—Bullion, Mary Gilbert, and Lord Elcho, are three good representatives of this class, and I would say unhesitatingly that if the habit of Lord Elcho could be introduced into the other two, without losing their floriferousness, we would have almost perfect yellows. Bullion has a fine perfume; it is a little deficient in substance.

Light Blues and Lavenders.—Favourite and Duchess of Sutherland are as good types as I know of. *Lilacina*, I believe, is very fine, but I have not grown it. A good light blue, not a lavender, is still wanted in *Violas*; something approaching in colour the old Blue King Panay. The habit of Favourite is good; that of Duchess of Sutherland could be improved.

Dark Blues or Purples.—A. Grant, Mrs. Turner, Holyrood, and True Blue are all good. True Blue has the ideal habit of a better, but would be improved with larger and better flowers. The blooms of A. Grant are almost perfect; it is a strong

grower, and in some situations is too tall. Mrs. Turner is very fine, both in colour and habit. I have never noticed any perfume worth speaking of in the dark blue *Violas*.

Rose and blush-coloured.—Sunrise and Dorothy Tennant are dark rose-coloured flowers. The habit of Sunrise is bad, but the flowers are large and fine. Wm. Neil is a pale rosy-lilac, and Blush Queen is of the palest blush colour. Both are perfect flowers, with a first-class habit; and the only forward step to be made in this section will be in procuring new shades of colour if possible, with more substance in the flowers. Wm. Neil is rather thin. Blush Queen is one of the gems of 1893.

FANCIES.

Striped flowers.—York and Lancaster, Dawn of Day, and H. M. Stanley all produce excellent flowers, but they all have bad habits. H. M. Stanley is the best of the three. A compact habit is undoubtedly what should be worked for in this class. All striped flowers have a marked tendency to sport; and in order to keep the stock pure, only those flowers with the best markings should be propagated from.

White flowers, with coloured edgcs.—Bluecloud or Skylark, White Duchess, Columbine. In Bluecloud the habit is perfect, and the constitution so hardy, that it will stand the severest frosts unburnt. The flowers are very effective. The habit of White Duchess is first-rate, and the flowers are chaste and beautiful, although a trifle thin. Columbine produces fine flowers, but it is always liable to sport, and it has a bad habit. Recently several additions to this class have been made, which, when they become better known, will be popular, but there is still room for improvement; edgings of different colours may be secured, and the depth of the same made to vary, as in the *Picotée*.

Yellow Flowers with Coloured Edgings.—This is comparatively a new class of *Violas*, but it gives promise of producing some fine things, especially for the exhibition table. Duchess of Fife and Peter Barr are the two best known. Duchess of Fife has a good habit, and is very attractive, but the flowers are like those of many others—lacking in substance. Peter Barr is quite a new break, and should be grown by all who are anxious to raise new varieties of *Violas*. I can vouch for its producing from seed some very fine things.

Countess of Kintore Type.—No name could more appropriately designate a section of the *Viola* than this old favourite. The section may be represented by Countess of Kintore, The Mearns, Mrs. Grant, and Mrs. Bellamy. All good so far as bloom is concerned. If improvement could be made, it would be in adding smoothness to The Mearns, but not if that quality were to detract from its freeness. The substance of Countess of Kintore is excellent, and it is an all-weather flower. The best habits are those of The Mearns and Mrs. Bellamy. There is plenty of room in this class for new and striking combinations of colour; but they must be quite distinct from the best varieties in commerce to be of any use.

The *Viola* with the best habit known to me is Bluecloud; the one with the best perfume is Bullion. Hardiness, habit, floriferousness, purity of colour, and perfume are the qualities to be worked for by *Viola* raisers, and in the order named. At least, such is my opinion. *William Cuthbertson, of the firm of Dobbie & Co., Rathesay, N.B.*

CHRYSANTHEMUMS ABOUT LONDON.

(Continued from p. 587.)

MR. NORMAN DAVIS, CAMBERWELL.—For some years past a good show has been annually presented at the Lilford Road Nursery, and its proprietor, who has been connected intimately with *Chrysanthemums* all his life, is well known as a successful raiser of new varieties. The collection this year was quite up to its usual standard, and the plants have carried very fine blooms. It was a fortunate circumstance for

Mr. Jones that Vivian Morel chose his establishment in which to originate the bronze sport called Chas. Davis. We may roughly estimate the demand there must have been last spring for this undoubted acquisition by the frequency we have seen it at the exhibitions, and in private collections. The bloom is exactly similar in shape and size to Vivian Morel, and its colour is very pleasing, especially in the darker forms of it. In constitution, it is apparently identical with its parent. We noticed a good number of plants had been kept at Camberwell, but the blooms were something past their best. A good number of Wm. Seward also had been kept, and these showed, perhaps more clearly than we have seen it elsewhere, the very free habit of this fine variety. Col. W. Smith was another variety especially in favour, if we may judge by the space afforded it; and the magnificent Lord Brooke was present, though in smaller number. Golden Wedding, too, was noticeable; this, a very fine rich golden Japanese, has been much thought of in America, and has lately been certificated here, but it seems to be a thin flower here at present.

Ladrac is the name of an orange-yellow Japanese with very long florets, and will make a large flower. It has not been shown yet, but may be expected to be valuable. Chas. Shrimpton had been good, and Jno. Shrimpton is liked, because its habit is good and dwarf. A curly-white Japanese was named L'Isère, apparently of average merit; but a far greater novelty was an incurved Japanese named Louise. It is a pretty blue-pink, large, and is almost sure to make a popular flower. The yellow sport of Lady Selborne, like in every particular except colour to its parent, will shortly be sent out, a large stock has been worked up, and it will be an acquisition for early decorative work, as no other variety is so popular for that purpose as is its parent. *Mdlle. Thérèse Rey* was in good form, and its broad florets of a soft white, shaded with cream towards the centre, makes it a truly magnificent bloom. It has another good feature, in that all the flowers are usually good, and it never appears "weedy." Mrs. Harman Payne was large, Mrs. E. D. Adams just opening its curious-looking buds; *Etoile de Lyon*, an especially good colour; and President Borel in fair condition. Vice-President Calvat, one of last year's Japanese incurved, was not at its best, but it seems likely to take a place among the standard varieties. Several seedlings of single-flowering varieties were pretty and good.

LYONS.

The Parc Tête d'Or at Lyons was probably the best kept and most interesting public garden which I visited on the continent. In this garden many plants appeared to me in quite new phases. The collections both of hardy and of indoor plants were very rich, and the individual specimens were good and healthy. *Magnolia grandiflora* was here a large tree covered with fruit, represented by many specimens and varieties. *Albizia Julibrissin* was quite hardy, and formed a graceful and elegant tree some 30 feet high. The collection of Coniferous plants was especially rich, but the climate seemed to be unsuitable for some of them, as they lacked the freshness and vigour seen in Ireland. Herbaceous plants and hardy annuals were very well grown. The Palm-house is large and well designed, the Palms are healthy, and many of the specimens are very fine. *Acanthorhiza Warscewiczii*, the *Phoenix acanthis*, although not the largest Palms, were the most remarkable specimens, being finer than I had ever before seen these two Palms. The collection of Orchids is rich in species and varieties of *Cattleya* and *Vanda*, and the plants belonging to these genera attained a state of health and vigour rarely to be seen in cultivation. The collection of succulent plants is one of the great features of the garden. Not only are the plants well grown, but many varieties are to be found represented by good specimens. All the succulents were arranged out of doors in bold masses or in single specimens, but in winter they are brought indoors. The temperature on the day of my visit was 92° Fahr. in the shade.

HYÈRES-LES-PALMIERS.

The Jardin d'Acclimatation at Hyères well deserves the commendations so generally bestowed on it by all interested in horticulture. In it have been brought together plants from many subtropical countries, and they grow and thrive in a manner astonishing to anyone who has only before seen them growing in pots under glass. The large specimens of *Eucalyptus globulus*, and of other species of *Eucalyptus*, are finer than I saw them anywhere else, except perhaps at the "Villa Menier" at Cannes, and they have assumed all the characters peculiar to them in their native homes. The Palms were also very remarkable. The tall straight stems of the Date Palm, *Phoenix dactylifera*, with thin sparse foliage, compare unfavourably with the stout stems, and rich and graceful foliage of *Phoenix canariensis*. The flower spikes in the latter species are also much more attractive. In it they are bright golden yellow, whilst in *P. dactylifera* they are dull greenish-yellow. *Dasyliion quadrangulum* is also a plant well worthy of attention. It was a larger specimen than I had seen before, and the flower spike which it carried was quite 20 feet high. A group of small trees of the varieties of "Date Plum," *Diospyros Kaki*, were fruiting nicely, some of the fruits being as large as a good *Magnum Bonum Plum*, and the colour a bright yellow. This plant has survived some winters at Glanvein, but it does not bear fruit. A large well-grown specimen of the Palm known as *Brahea Roelzii*, but which should be *Erythea armata*, was the most remarkable plant in the whole collection. The leaves, in the bright sunshine, seemed to be almost blue, forming a marked contrast to the surrounding foliage. I have found it impossible to get this Palm to assume the tints which I admired so much in several gardens along the Riviera, and a splendid specimen which was brought to Ireland from Nice, almost completely lost its distinctive colour in a couple of years. The collection of Bamboos was also a feature of much interest.

CANNES.

At Cannes I visited several gardens, the most remarkable of which was that belonging to the "Villa Menier." The landscape design in this garden was better than in any other, and there was more originality shown in grouping the plants. Some of the groups of Palms, Bamboos, *Musa Ensete*, and tree Ferns, were really excellent, better than in any other garden visited by me. A magnificent plant of *Eucalyptus globulus* near the entrance-gate is quite a feature in the garden. Other remarkable plants noticed by me, in or about Cannes, were *Washingtonia filifera* and *W. robusta*, both fine; *Ficus elastica*, a tree 30 feet high; *Grevillea Banksii*, a fine specimen nearly 20 feet high; *Sabal umbraculifera*, with a clear stem 15 feet; *Cocos flexuosa*, *Cocos campestris*, and *Eugenia myrtifolia*. The capabilities of the climate and soil about Cannes are apparently not thoroughly tested, and there is still much room for experiment. The proprietors of gardens seem to be content to imitate each other, to plant what their neighbours plant, and to design their gardens as the neighbouring gardens are designed, thus rendering most of the gardens a mere repetition one of the other.

LA MORTOLA.

The most interesting garden visited by me during my journey, was that of Thomas Hanbury, Esq., at La Mortola, on the borders of France and Italy. The situation is very beautiful, the grounds, diversified and undulating, running down to the sea-shore. The natural advantages have been fully utilised, and great taste has been brought to bear on grouping and arranging the plants. There are few botanic gardens which contain a collection of plants equal to that which Mr. Hanbury has got together at La Mortola, and there are no gardens, private or public, where plants are better grown or better tended. From one boundary to the other, rare plants meet one's view at every turn and at every point, and within reasonable limits it would be impossible to do more than to enumerate a few of those which appeared most remarkable at the time of my visit. Immediately beside the dwelling-house stands a magnificent specimen of the rare *Euphorbia abyssinica*, about 25 feet high, much branched, the branches with angular stems, the points of the angles being strongly marked with black. Beside it are other plants from Abyssinia, supposed to be new. Further on, the path is overhung with a dense growth of *Ephedra altissima*, which was covered with innumerable beautiful red fruits, much resembling the fruits of the Yew; a very remarkable sight, and highly interesting. *Russelia*

juncea, a somewhat shy flowerer in the stoves at Glanvein, was covered with red blossoms, the long slender branches hanging gracefully over the paths and banks. *Cocos australis* was in fruit, this being the only species of *Cocos* which I saw in fruit in any of the gardens which I visited. Near it was a fine plant of *Aberia Caffra*, covered with handsome yellow fruits, as large as those of the "Grecian Thorn," and somewhat the same colour. *Brachychiton populnea* forms a distinct evergreen tree, in effect not unlike the Portugal Laurel in our climate, but with a more upright habit.

The collection of Australian Proteads forms a very interesting feature. These wonderful plants seem to be quite at home, and were growing freely. Two of the most remarkable were *Hakea Baxteri* and *Banksia grandis*, both rare plants. *Ficus elastica* formed a magnificent evergreen tree, and *Papyrus antiquorum* grew vigorously in a damp spot. A noble group of the black-stemmed Bamboo (*Bambusa nigra*) was bold and effective, the canes being between 20 and 30 feet long. *Maclura aurantiaca* was covered with large and showy fruit. The Norfolk Island Pine (*Araucaria excelsa*) and its relative *Araucaria Cunninghami*, formed very grand specimens, and grew with astonishing vigour. *Aralia dactylifolia* was also remarkable; it formed a large and symmetrical bush 15 feet high, and as much through, the large deeply-divided leaves being very effective. The collection of succulent plants is perhaps the strongest point at La Mortola.

In this very complete collection are included many unique plants, and from it several new species have been named and described. Not only is the collection remarkable for the number of species represented, but also for the size and vigour of many of the specimens. Nothing that one sees under glass can convey an adequate idea of the grandeur of many of these gigantic and beautiful Agaves, as seen on a high bank at La Mortola, backed by evergreens and trees, in some cases throwing much branched inflorescences, a foot in diameter at the base, at least 30 feet into the air.

FLORENCE.

I was most anxious to have an opportunity of inspecting the collection of Orchids belonging to H. J. Ross, Esq., at Poggio Gherardo, near Florence. I was well repaid for going there. The same thing struck me as at Lyons—that is, the great vigour and strong growth of many plants which are not considered good growers in Ireland. *Aërides Lawrenceæ*, *A. Sanderiana*, and *A. Veitchii* were three plants which have probably no equals in cultivation. The "Moth Orchids" also grew wonderfully. Such rare species as *Phalenopsis Stuartiana*, *P. gloriosa*, and *P. speciosa* were represented by large healthy specimens, and *P. Schilleriana* had leaves of unusual size and substance. The growth of *Bollea* and *Pescatorea* (*Zygopetalum*) was such as to make one doubt if the plants could be the same as those grown under the same names at home. Cattleyas were also much stronger than usually met with. The heat in the Orchid-houses was not excessive, and the additional vigour seems to be due to the free and continual ventilation which the climate admits of, aided by the bright sunshine and the absence of dull, damp, foggy weather, to which of course must be added the attention and cultural skill of the proprietor. *F. Moore, Report, Glasnevin Garden.*

ROYAL BOTANICAL GARDENS,
MANCHESTER.

If useful public services are the test of a society's importance, we have no hesitation in saying that the Manchester Society occupies a foremost place among similar institutions. For the last twenty-five years no horticultural society in the country has distributed such large sums of money in the promotion and encouragement of botanical and horticultural pursuits. Being a cultivator of Orchids, I should like to say a few words about what I saw on the occasion of a recent visit. Entering the show-house one saw at once a very fine display of bloom, chiefly made by *Cattleya labiata vera*. The plants are in fine health, well flowered, and amongst them are some very fine varieties, one or two being exceptionally dark-coloured. A few other good species of Orchids were *Ocidium varicosum*, var. *Rogersii*, the largest form of *O. varicosum*; *O. micro-pogon*, *O. crispum*, *O. C. var. grandiflora*; the beautiful and rather rare *O. Gardneri*, with fine

branching spikes; *O. fuscatum* (*Miltonia Warscewiczii*), fine plant with strong spikes of its brownish-petalled flowers, with lip of rosy purple; *Vanda Amesiana* having five fine flower-spikes. These were interspersed among a number of plants of *Cypripedium insigne*, *C. i. Chantrieri*, *Odontoglossum crispum*, *O. Hallii*, very fine as regarded the varieties and the flower spikes that they carried; and *O. Harryanum*.

In a large house set apart for the culture of Orchids near the entrance to the garden, stands a noble specimen and fine form of *Cattleya labiata*, carrying twenty-three fine flowers. Arranged round the centre stages are some fifty plants now in flower; and I also observed plants of *C. Gaskelliana*, *C. Mossia*, *C. Mendeli*, *C. speciosissima*, which possessed very large pseudobulbs; *Vanda* was likewise well represented here, viz. *V. tricolor*, *V. t. snavis*, *V. Kimballiana*; besides *Aërides odoratum*, *Angræcum sesquipedale*, *Saccolabium*, and others. A fine plant of *Cymbidium Lowianum*, possesses six fine flower spikes, and two fine plants of *Cypripedium Sedeni*, sixteen flowers spikes each. It was a pleasure to find so fine a collection of species and varieties of *Cypripedium*, which flower freely in the winter months, viz., *Harrisianum*, *Spicerianum*, *Lathamianum*, *veixillarium superbum*, *Arthurianum*, *Niobe*, *Swinburnii*, and *calurum*. Good plants were remarked of *C. Stonei*, *C. Morgania*, *C. Mrs. Canham*, *C. Chamberlainianum*, *C. Germinyanum*, *C. Cleola*, *C. cardinalis*, *C. politum*, and a number of others. *D.*

FLORISTS' FLOWERS.

CHRYSANTHEMUM GROWERS' TERMS.

The remarks at p. 592 are very appropriate at a time when growers are careful to read, learn, and inwardly digest all that is written about their favourite flower. In the remarks there given, I do not find the first term used by the growers, namely, the "crown" bud. How or when these terms have been adopted I am unable to say; but when I constantly exhibited *Chrysanthemums* some twenty-five years ago, neither of the terms were used; had they been, I believe I should have remembered them, for I annually visited Mr. Salter's collection at the Versailles Nursery, Hammersmith, now built over. The two terms are even now confusing to those who have no practical knowledge of the growth of the plants, and information is constantly wanted about them from visitors when the plants are in flower, but it is easier to explain the difference between the two terms by a practical illustration in August and September than it is in November. For garden purposes, the term "crown" bud does very well, for it is the centre or crown of a group of buds at the end of the growth; indeed, the term can only be fully appreciated by those who have a practical knowledge of "taking" the buds. There is the larger bud in the form of a crown in the centre, and standing above all the others. [The true terminal bud of the botanist.] The question to be determined at this time is, whether the centre bud shall be left or taken out; in some instances it is better to leave it and remove the side buds with the finger-nail; in the case of another variety, the centre bud is removed, and one of the side buds is trained up to take its place, and this bud to all intents becomes the terminal bud, with a number of lateral buds clustering around it; but except that the two terms are in general use, there is no reason why "terminal" should not apply to each. The exhibitor who is successful at flower shows, has learned by experience or from other cultivators the date when the buds of each individual variety should be taken, and also whether it does better on a "crown" bud or upon a "terminal." For instance, the Queen of England section may require that the buds should not be set before the third week in September, but suppose that the crown bud is formed in the first week of that month, it would never do to "take" it, as not only would it be too early for the exhibitions, but

such flowers as would be produced from these early buds would be too full of petals, and lack altogether the symmetry of exhibition blooms. As a general rule, the buds underneath the crown bud are not flower-buds at all, but leaf-buds; if they were flower-buds, they would not form terminals. The grower takes out the flower-bud in the centre, and removes all the other buds or growths except two, his object in leaving two is upon the principle of having two strings to a bow, in case one should break; so in the case of these terminal growths, one may be a failure, but as soon as it is seen that they are both good growths, one of them should at once be removed; or if one is bad and the other good, the bad one must go of course. It is a very simple matter, and can easily be determined. Exhibitors who have had any measure of success, know quite well whether they should take the crown bud or a terminal of the various varieties. I referred to Queen of England and the sports from it as one that the buds should not be taken too early; on the other hand, the Japanese Mrs. Falconer Jameson must be taken from a crown bud. We had several plants of that variety this year, and I well knew that to obtain large fine blooms, one only should be allowed to develop on a plant, and that in each case the centre or crown bud should be selected, but all our buds were abortive except one this year, and we had therefore to train up side-growths, the result being that all the flowers are worthless except the one which was formed in August as a crown bud. Another peculiarity of this variety is, that to obtain flowers of the largest size, one only should be suffered to remain on each plant. Another point not noticed at p. 592 is, the influence which the seasons have upon the quality of the blooms. In some seasons one particular variety will be of high-class excellence almost everywhere, and other varieties will be much below their usual quality. The variety Jeanne d'Arc is good all round this year, indeed, it is much better than I ever saw it. "The Queen" section again has in most collections been inferior to what it is usually seen. I heard the expression used several times amongst exhibitors that this was not a good "Queen" year. Madame Darrier, a rather new buff-coloured variety, has been fine throughout; but Refulgence, a rich crimson or purplish-crimson variety, which was in great beauty last year, has also fallen behind. This is a matter for the physiologist to study, but it is almost as mysterious as the variation of colours in certain seasons. *J. Douglas*. [Will our correspondent kindly give the various dates at which buds may be selected (taken), and the varieties operated upon on those dates, also the varieties requiring exceptional treatment as regards the buds. Ed.]

NURSERY NOTES.

ROYAL NURSERIES, SLOUGH.

MANY who lament that they are unable to grow Violets (and many such there are, even among otherwise successful gardeners) would be astonished at the large and healthy plants, thickly set with buds, which are to be found in Mr. Turner's nursery at Slough. All the best varieties are grown, and all alike thrive admirably, and while giving but little trouble afford quantities of bloom throughout the winter. We purpose inspecting the Violets at Slough from time to time, and hope to give a detailed account of the culture which is there so successful, and which Mr. Turner states would insure success if followed out in every [rural] garden. The 70,000 Carnations, the houses of Cyclamen, Azaleas, Pelargoniums, Camellias, &c., at Slough, are also in fine condition.

The Chrysanthemums are well up to the mark, the span-roofed houses in which they are arranged being brilliant with well-finished flowers. New varieties and established favourites only are grown for show, although most of the others are kept in stock, and may be seen with flowers on them. Among the more striking flowers we noted Primrose League, a Japanese, a fine flower of a primrose

colour, changing to cream-white; Mrs. Walter Cutting, an incurved white, shaded with lilac; Lord Brooke, a fine yellow flower, tinged with bronze, is also magnificent. The white Louis Böhmer is an exceedingly fine thing; W. Tricker, a good bloom showing various shades of lilac; Mrs. Robinson King and The Tribune, fine yellows. J. Stanborough had fine yellow flowers, with a bronzy hue; Lady Lawrence was one of the best, the flowers being of great size; and other favourites showed up to such advantage that it was evident some of them had not been deposed by the newer varieties. Among others Lizzie Cartledge, W. A. Manda, and Chas. Davis were remarkable.

THE CORSICAN PINE.

I SEE by occasional notes in the *Gardeners' Chronicle*, that this Pine is now gaining more favour. It is not at all creditable to foresters that it has been so little planted, or perhaps, I should say, that there have been so many failures in the planting of the tree. Scotch planters have confessed in arboricultural papers that nearly half the number die in the planting, and a mistaken prejudice exists against it on that account. I lately heard a Scotch forester on a large English estate say, that the Corsican was "a brute" to plant, and he would not have it, whereas he could have seen great tracts of it growing on the adjoining estate better than the Scots Fir; and the reason of success in that case was, that not a tree had been planted later than the end of October, most of them weeks before that, and none earlier than the middle of April, while not a few had been planted in May or June. It is certain that an enormous proportion of the Corsicans do die when planted from November till March, but the forester who is not half so judicious as the gardener in selecting his season for planting different subjects, sticks to the rule-of-thumb plan of beginning to plant when he ought to finish, or leaving off when he ought to begin, which will not do with Pines, which should be treated like the Holly. Some years back, I saw a quarter of Hollies in a home-nursery that had been moved in December, and I did not see one live one in the lot. In May and August they would have been safe. I have moved thousands of Hollies up to forty years of age in every month between April and September, and lost few, and have them now to show. Another fault the forester has against the Corsican Pine is the quality of its timber, a question that should always be gauged by the uses to which it can be most profitably put. One, for example, of our collieries here uses between 4000 and 5000 cubic feet of Norwegian Spruce pit-props every month in the year at from $7\frac{1}{2}d.$ to $9d.$ per foot, and all the coal-pits in the country use the same props because we have no timber at home so suitable. Yet the Corsican makes a model pit-prop because it makes a clean pole of even girth, and I could dispose of hundreds of thousands of feet of it to-morrow if I had them, and on fair land a good crop can be raised in thirty years or less. No tree will bear crowding better. I believe I have one of the biggest stocks of growing Corsicans in the country, but the crop is not old enough to reap. Of less size than the Scots when alternately planted, they are now "nursing" the Scots. The only tree that competes with the Corsican is the Larch, when it escapes the disease, but the Corsican puts on bulk sooner, and can be produced cheaper. Besides, when dry, it is light—a great recommendation in a pit-prop. The Norwegian Spruce prop is light, but very perishable and weak. I see them coming up in tons out of the pits, smashed and broken, and going for fire-wood. Yet we have some thousands of acres of woods, and cannot sell I foot for props to the lessees of our own pits. The pit hands would probably

strike if any less handy and portable timber was used. It does not matter to them how many are used. Yet in Scotland, at least, they profess to have been growing Spruce and other Firs scientifically for a longer period than the age of the present Norwegian pit-props, scaffold and ladder poles, fencing rails, &c., and yet even then the foreign props are everywhere stacked by hundreds of thousands, girthing generally from 3 inches to 6 inches in the middle. The length of the prop and its thickness depends on the thickness of the seams of coal and the roof of the pit. I am not here speaking of the profits from planting, but if I had an estate I was obliged to plant, I would plant the Corsican, and let grow them like seedlings in a hotbed, and sell the crop in blocks. My next best favourite for the same purpose would be the Wellingtonia, but the conviction is fast forming in my mind that some of the Thuias and Cupressus would produce a greater number of saleable poles to the acre than any tree yet tried in this country. These species at an early stage throw up from four and five to as many as twelve limbs, that grow within a few inches of each other in a cylindrical manner—one yard or less covering the diameter of the bundle, all remarkably straight and clean. We have some unnamed examples of these (Lawson's Cypress, I think), between 20 and 30 feet high, and growing fast, each containing small poles as described, just exceeding or approaching the pit-prop size. About 8 feet covers the widest diameter of the branches of these trees, so it can be easily reckoned how many an acre would produce. It is by studying the minutiae respecting tree growth that one can reckon the profits or losses of planting, and any experienced woodman should be able, even in a strange locality, to calculate with approximate correctness what an acre of land will produce of measurable timber. Finally, as to planting the Corsican, we have hundreds of thousands of it from a young stage up to thirty years, few of the last in situations from about 200 feet above the sea to 1100 feet, and in a variety of soils and exposures, all doing well. Foresters have seen our almost unbroken rows of Corsicans, who could not be persuaded, except by seeing, and some of them seemed as if they would have been better pleased if their condition could have been attributed to some climatic peculiarity or the like, rather than that preconceived prejudices should have been upset. I have been referred also to authorities on the Conifer for corroboration of the Corsican's bad character as a transplant and carry rooter, but that character has been derived from unskilful planters. Rooters like the Corsican certainly do not succeed by the miserable "notch system" of planting, by which the roots are exposed to alternate frosts, and thaws, and droughts, when they can least bear a check, but if the long roots are dibbled straight down, as tap-roots should be, like Cabbages, they will be out of the reach of these evils, and the lateral roots will take care of themselves. Preparing the pits before-hand, exposing the soil to frost, turning the sod in, and all the rest of it, is quite needless. Apologising for encroaching so much on your space. *S., The Woods.*

FOREIGN CORRESPONDENCE.

COOKING THE LIMA BEAN.

YOUR correspondent, Mr. S. Courtauld, in his interesting notes of rare vegetables, on p. 424, speaks of cooking the Lima Bean in the pod. This Bean is a very popular vegetable in America, but it is never cooked in the pod; indeed, its outer covering is very tough, as well as bitter. It should be shelled, and boiled, just as one would cook green Peas. It is usually served with drawn butter, or else a portion of the water in which the Beans are boiled is retained and thickened with flour and butter, this last being the usual American mode of serving either Beans or Peas. Mixed with green Corn, the Lima Bean makes delicious "succatosh." In any form, it is the

most delicately-flavoured legume I know, and would certainly be a great acquisition to English gardens, if the climate will permit. *E. L. Toplin, Chicago.*

GRAMMATOPHYLLUM SPECIOSUM.

I send you a photograph of *Grammatophyllum speciosum* growing in the Botanic Gardens, Penang, mention of which was made by Mr. J. Veitch, in his "Traveller's Notes" in your issue of November 26 of last year. At the time of Mr. Veitch's visit, the plant measured 42½ feet in circumference, but it has grown somewhat since then, and this year produced twenty-four flower-spikes from 7 to 8 feet long. At the time it was photographed it had about 1000 fully-expanded flowers. It is growing on a mound 3 to 4 feet high, where it gets the full sun all day after about 9 in the morning. Once or twice a year half a cartload of leaf-mould is scattered among the roots, and this is the only attention it receives. This plant is rather widely distributed throughout Malaysia, but, so far as my observation goes, it is nowhere abundant. The finest plants are generally found high up in the forks of not very leafy trees, where it gets an abundance of sunlight. What is *Grammatophyllum Sanderianum*, figured in the *Gardeners' Chronicle* last July—*Grammatophyllum speciosum* without leaves? *C. Curtis.* [We are greatly indebted to our correspondent, but having already figured the plant on more than one occasion, there is no need to do so now. The gigantic pseudobulbs alluded to are those of *G. speciosum*; the name *Sanderianum* was a provisional name only, and should be disused in future. Ed.]

WASHINGTONIAS (PRITCHARDIA).

At last the *Washingtonia filifera* has flowered in the Riviera gardens at the Villa "Les Delices," at Cannes. This is the first time, as far as I can ascertain, that it has flowered, although I recently saw in the *Lyon Horticole* that it had flowered and fruited at Palermo last year. The plant which has just recently flowered is decidedly not the largest specimen or oldest which exists here, but at the same time it is a very fine plant, measuring 12 feet in circumference at the base of the trunk, with a clear stem of about 20 feet in height. It bore two spikes, which resemble very much the Sabal in appearance.

It is comparatively of recent date that the *Washingtonia* has been introduced to the Riviera gardens, but it is nevertheless surprising to see the gigantic proportions which the trees have already attained. It was about the year 1878 that they were planted for the first time, originating, I am told, from the firm of Illage & Schmidt, of Erfurt. The largest specimen supposed to exist on the Riviera is at the Valetta Gardens, Cannes, which measures just over 13 feet in circumference at base of the trunk. The tallest I have seen are at Villa Madrid, some of which measure quite 28 feet in height.

Washingtonia robusta grows even faster than *W. filifera*, as may be seen by the accompanying photo [not received], which is of a plant which was planted in 1885, and was then only about 5 feet in height. It has now a clear trunk, 23 feet in height, with a beautiful head of foliage. *Washingtonia macrocarpa* is to be found occasionally in the eastern part of the Riviera, but in the west it is rather too cold. I saw this year at the Villa Riquet, near Mentone, a very fine specimen carrying an enormous head of foliage, and the picture of health.

The *Washingtonia* is decidedly one of the finest Palms to be found here, and is to be seen chiefly on the western part, whilst on the eastern very few are to be met with in villa gardens. *Riviera.*

THE ROSARY.

BOURBON ROSES.

With the exception of Madame Isaac Pereire and Mrs. Paul, all of the Bourbons of any merit are very old varieties. Although by no means a small class, there are only a few which are worthy of cultivation among the present-day Roses. Sir Joseph Paxton

(Laffay, 1852), Guilietta (Laurentius, 1860), Mrs. Bosanquet (Laffay, 1832), Souvenir de la Malmaison (Beluze, 1843), Baron Gonella (Gaillot, 1859), Leveson-Gower (Beluze, 1846), syn. with Malmaison Rouge, and Queen of Bedders (Noble, 1878), being the best of some eighty or ninety varieties on our list. Turning to the newer varieties, we find Kronprinzessin Victoria (Spath, 1888), the white Malmaison, and Eurydice (Ketten, 1887) taking first place. The hybrid Bourbons cause considerable confusion, and if the class grows at the rate it promises, it will give some trouble to classifiers of Roses. Already we have Madame Isaac Pereire figuring with the hybrid perpetuals in many catalogues. The National Rose Society take it as a Bourbon, and I have little doubt this is correct; but many growers place it as a hybrid Bourbon. I think all will agree that Roses are over-classified, there being scarcely any class in which examples may not be found which would be equally well included in some other class. Hybrid Chinas, hybrid Bourbons, Bourbons, hybrid perpetuals, and some few of the hybrid Teas, might well be placed together under one heading. Even if for no other reason than easy reference, I think this suggestion is worth consideration. Mr. F. Cant and a few more catalogue these classes alphabetically, and thus render their Rose lists much less confusing than those which retain each variety in its class. Some few of the best hybrid Chinas and H. Bourbons, in addition to these named, are Blairii No. 2 (Blair, 1845), Coup d'Illébé (Laffay, 1840), Paul Ricaut (Portemer, 1845), and Charles Lawson (Lawson, 1853). Paul Veudier is another H. Bourbon which frequently figures among the H. Perpetuals. I shall be very glad when some more simple method of classifying Roses can be decided upon; certainly the present classes are confusing, and have approached one another so closely, that very few if any could draw the line between selected varieties of several classes. *A. P.*

FRUIT REGISTER.

APPLES, COX'S POMONA AND ECKLINVILLE SEEDLING.

We have in these two varieties very good croppers, and Pomona is of a beautiful colour, of fair size, and it seldom fails to crop, whilst the tree, as a rule, grows freely. The fruits of Ecklinville are usually gathered and sent to market, or consumed direct from the trees. Both of these varieties are largely grown, but they are not good travellers, which is much against them as market fruits. I have been told that Ecklinville, although an early and heavy cropper, was about the worst when unpacked in the market, owing to its softness; the same is likewise true of Cox's Pomona. For home consumption, or for the supply of neighbouring markets, both sorts are very suitable ones.

CORNISH GILLIFLOWER.

In this variety we have one of the best-flavoured dessert Apples, though a somewhat shy bearer, but it sometimes fruits well, and usually at the points of the shoots. The fruits are not as fine in appearance as some others, but in quality there are few, if any, that equal it. The tree appears to fruit best when grown as a standard, and in soils that are not made too rich. *H. Markham.*

THE WEEK'S WORK.

THE KITCHEN GARDEN.

By H. O. PRINSEP, *Gardener, Buxted Park, Uckfield.*

JERUSALEM ARTICHOKEs.—The stalks may now be cut down and burnt, and a few roots lifted in fine weather, storing them for use in frosty or very wet weather. If litter be not objected to, the roots left in the soil may be covered with about 6 inches of decayed leaves or loose litter, so as to exclude frost.

STORE-HOUSE OR CELLAR.—Take advantage of bad and showery weather to look over all roots stored away, for on account of the mild autumn some of these will be starting into growth; and if these are allowed to remain in the store, their juices and their flavour soon deteriorate. Potatoes that were early lifted are already starting into growth, especially the more forward varieties, so that every precaution should be taken to keep the temperature of the store as cool as possible. Leave nothing that has

begun to decay, as decay soon spreads, and much mischief is done. Tubers intended for use in planting next season should be spread out thinly on a dry cool floor, and if possible exposed to light and air, thus promoting sturdy growth.

FORCED VEGETABLES.—These will soon be in request, and therefore the supply of them should be equal to the demand. French Beans growing in frames will require careful attention, dampness having a bad effect on the blossoms if the temperature is low, and air not freely admitted; but an arid atmosphere must be avoided, or red-spider will soon show itself on the leaves. Make fresh sowings of Beans at intervals of twelve to fifteen days, or according to the demand and the amount of space available for growing them; more space, however, will be required for these sowings than for sowings made in February, the flowers not setting freely during the winter months, nor the pods attaining so large a size.

POTATOS planted on slight hotbeds, if the shoots have grown 1 foot high, may be earthed-up with light fresh soil made warm, and the job performed on a mild day. It is a good practice to mix a small quantity of finely-powdered Kainit with the earthing-up soil, and to water the bed previously, allowing the foliage to get dry before nightfall. But little moisture is necessary after the earthing-up, as it spoils the flavour of the Potatoes.

ASPARAGUS that has started into growth should have a top-heat of 60° to 65°, anything exceeding the higher figures causing weakly growth. If water be needed, afford it at the same temperature as that of the soil, which should be tested with a plunging thermometer.

CARROTS, &c., if they have pushed through the soil, should be thinned to 1 inch apart; but if snails are troublesome, it is well not to thin before the plants have acquired some degree of strength. Some kind of slug or snail-trap should be improvised for catching them. Radishes and Onions, the latter especially, must receive early attention, or they soon get spoiled. Seakale and Rhubarb must be put into the forcing-pits in quantity, as may be required. Roots in the open ground should be covered lightly with litter or half-rotted leaves, after clearing away decayed leaves, and some of them taken up in readiness for forcing, storing them in cold sheds, &c.

GENERAL WORK.—At this time of the year fresh plantations of bush fruits, involving the trenching of the ground, have sometimes to be made, and there should be no delay in getting on with such operations. The Celery and other tender vegetables must receive attention, Pea-stakes be got in and trimmed, and Birch obtained for broom-making, &c., in bad weather, not forgetting label-making for all kinds of purposes.

PLANTS UNDER GLASS.

By B. WADDS, *Gardener, Birdsall Gardens, York.*

THE WINTER MANAGEMENT OF THE STOVE.—Much carefulness must be exercised in watering plants and in cleaning and re-arranging them from time to time, always putting those which are showing flower in the best positions. Those which are likely to be useful at the Christmas season, viz., *Eucharis amazonica*, *Euphorbia jacquiniiflora*, *Plumbago rosea*, *Eranthemum pulchellum*, *E. Andersonianum*, *Pancreatum fragrans*, *Pentaea carnea*, *Linum trigynum*, *Libonia floribunda*, *Thyracanthus rutilans*, *Centropogon Lucyanus*, *Centradenia floribunda rosea*, and such *Gardenias* as are furnished with flower-buds, should be also well attended to, and accorded light positions not far from the glass, and be kept in a clean, well-cared-for condition. The water or manure-water afforded them should always be tepid. *Gardenias* in a pot-bound condition are benefited after they have been allowed to get rather dry at the roots by having the pot plunged to the rim in tepid manure-water for ten minutes. Continual waterings about the stem of a plant, or on the surface of the soil, sometimes makes channels through which the water passes off, leaving some portions of the ball in a dry state. If ½ oz. of Standen's Clay's, or other well-known fertiliser be put in one pail of water, the plants derive much benefit, and sometimes for a change the same quantity of nitrate of soda may be made use of. Syringing overhead should now be done early in the day. Gesneras which are gone out of flower may be gradually ripened off and be stowed away with the *Caladiums*, *Gloxinias*, *Gloriosas*, and *Achimenes*, in a dry warm place. *Caladiums*, *Crotons*, *Dracenas*, *Aralias*, *Palms*, and other fine foliage plants should be kept quite clean from all

insect enemies. If thrips or mealy-bug are present on any of them, syringe weekly with Lemon-oil or petroleum emulsion.

PLANTS KEPT IN SMALL POTS FOR TABLE DECORATION.—These must in a general way be kept well in the light, and afforded a liberal supply of plant food. Plants of Allamandas, Clerodendrons, Bougainvilleas, and Dipladenias should now be at rest, and in this state may be placed in a cool part of the house, or removed to an intermediate-house. Poinsettias must have a good supply of manure-water to help them to form fine heads of bracts; *Ixoras*, *Stephanotis*, *Rondeletias*, and other evergreen plants must not get very dry at the roots, or they will lose their foliage, and they should be placed in the colder part of the stove where they may stay for the next two months. See that red-spider does not infest them, and to prevent its attacks well syringe the foliage on the underside at times. *Epiphyllums* ought to be very beautiful at this season in moderately-warm stove or intermediate-house. They are plants not requiring much water. Some of the best varieties are *E. truncatum*, *Hookeri*, *E. t. magnificum*, *E. t. coccineum*, *E. t. spectabile*, *E. t. tricolor*, *E. t. aurantiacum*, *E. t. Makoyanum*, *E. t. superbum*. They are mostly grown as worked plants on *Pereeskia aculeata*, or some strong-growing *Cereus* or other Cactus, but for basket-work they do well on their own roots. The temperature of the stove should now range from 60° to 65° by night, 70° to 75° by day, with a small quantity of air afforded by the side-ventilation during mild weather.

HYACINTHS, TULIPS, NARCISSUS, and other bulbs that were potted last month and placed under fine coal-ashes, should be brought under glass, after cleaning the pots and the surface of the soil. Afford them water, and place in a cool pit or greenhouse for a time; see that they do not get drawn by being too far from the glass. *Lilium auratum*, *L. Harriaii*, and *L. candidum* bulbs starting to grow should be brought into a cool-house, and potted in rough loam three-quarters, dung one-quarter, and coarse sand. Several bulbs may go into a large pot, or one bulb into a small one, putting the bulbs half-way down in the pot, and only half-filling it with soil.

MIGNONETTE coming into flower should be neatly staked, and well attended to for water, keeping the pots in a cool-house or in a brick pit, on a bed of soil or ashes if possible. The plant does not like fire-heat, but the potting soil should be rich and porous, being made very firm by ramming it.

AURICULAS should have careful watering, and much air night and day for the next three months. Exclude frost, and do not let the soil in the pots become quite dusty before affording water.

CHRYSANTHEMUMS.—During the time these are in flower care should be taken to have them rightly named. If cuttings are to be taken from them, and as soon as flowering is past, cut them down, and place the pots in an unused forcing-house, but keeping the frost from them, giving air, and watering as they may need.

THE ORCHID HOUSES.

By W. HOLMES, Gardener, Pickering Lodge, Timperley.

CATTLEYA-HOUSE.—Plants of *Cattleya Trianae* having now made and matured their pseudobulbs for this and next year flowering, will now be resting in some cool and airy part of this house, getting no more water than is really needful to prevent shrivelling. Some of the earliest flowerers will soon be showing flower-buds in the sheaths, in which case they do not often start again, but the flower-buds come steadily on. *Cattleya Percivalliana*, an early-flowering variety, comes into flower about the new year, should be carefully watered, and kept resting for a short time longer, but not allowed to become dust-dry, or the flowers will be small and thin. It is a species that requires a few degrees more warmth when at rest than *C. Trianae* needs. *Cattleya Mossiae*, *C. Mendeli*, and *C. Schroderae* have made up this year's pseudobulbs, whilst others have only partly done so, and the latter will need to be watched, and as they finish their growth should be moved into a cool, airy, light part of the house. *Cattleyas* which have not finished growing should be placed where the temperature is warmer. We use our plants to this kind of treatment from this date onwards, so as to get the growth early completed. *Cattleyas*, as they finish growing, should have the dust and white scale sponged from the leaves with tepid soap-suds—a safe and cheap insecticide. Any pseudobulbs growing out of place, should be tied to neat stakes, but do not twist them, as this would cause crippled flowers. *Cattleya*

Warneri, *C. speciosissima*, *C. anrea*, *C. gigas* types, *C. Schilleriana*, *C. Gaskelliana*, if placed at the cooler end of this house, as advised in previous Calendar, and gradually ripened by giving them all the light and air that is safe, and careful watering, will need but little more water until January. Plants of *Odontoglossum citrosimum* and *O. grande*, placed in this house during the resting period, if growth be completed, should be very sparingly watered for a time, and then withhold water altogether for a time, to check the formation of new growth in the winter. *O. grande* will keep plump for a long time without any water at this season, and a good drying-off causes them to flower freely. Place these plants on a shelf close up to the roof. The flower-spikes of *O. Inseayi* will now be advanced, and enough water should be afforded as well, to keep the material about the roots moist. *O. coronarium*, and its fine variety, *O. miniatum*, may also be grown in this house, and as these make their new growths during the winter, they require to be very carefully afforded water, only just sufficient to keep the sphagnum moss in a fresh state.

THE HARDY FRUIT GARDEN.

By T. TUTTON, Gardener, Maiden Erlegh, Reading.

PRUNING PLUM TREES.—The pruning and training of Plum trees on walls and fences should be proceeded with as soon as the Cherries are finished; and this is of more importance if the trees are aged, or have long spurs, or these have become crowded. Bearing in mind the necessity of leaving spurs sufficient in number to carry a good crop of fruit, the longest, most bare, and worst-placed ones should be pruned-back to within 1 or 2 inches of the base. When spurs are allowed to extend 1 foot or more out from the wall, not only is the protection afforded by walls to the trees when in bloom to a certain extent lost, but the further protection of them by means of netting and other contrivances made difficult, and the dealing with aphids is also increased, long spurs affording a good harbour for them.

DRESSING THE TREES.—Plum trees infested with brown-scale should have their branches and twigs loosened from the wall, and be treated in the same manner as recommended in last week's Calendar for sweet Cherries, using the same insecticides, &c. Where the trees have been infested with aphids only, after finishing the nailing, &c., (which by the way should be closely examined, and tight fastenings made easy, and unnecessary ones removed), the trees should be well syringed with the soap-suds and petroleum emulsion, directing the spray behind the branches, which will be nearly certain to exterminate the aphides. It will, however, be advisable to again syringe the trees in mild weather in the winter and in the spring before bloom opens.

THE BORDERS.—The digging of the Plum tree borders may be undertaken as early as pruning, nailing, &c., is finished. Plums being surface-rooters, where it is the custom to deeply dig and crop such borders with vegetables, the check must be less to the trees if it be done at this season than in the spring. Should the trees be much restricted in the matter of space, the hard pruning-back of the roots with the spade may be considered as being beneficial rather than otherwise. But for high walls my practice is to deeply trench the border, and where the subsoil is of an unsuitable nature to remove a good portion, replace it with fresh loam, chalk, old mortar, or lime, and afterwards crop the borders with such subjects as will succeed with single digging only. In no case must the borders be dug deeply closer than 4 feet from the wall.

THE FLOWER GARDEN.

By T. H. CRASP.

ROSES.—During the present month the planting of Roses should have been completed, but where that is not the case, Roses may be planted in mild weather, care being taken to mulch them with litter. Where the tops are large, slightly prune the shoots, to prevent wind-waving. Standards should be staked and loosely tied immediately after planting.

BEDDING PLANTS.—Either store-pots or others must get constant attention, especially where housed in pits, affording them plenty of air in open weather, not any more water than they really need, picking off decaying foliage, and pricking up the surface of the soil if caked. Fire-heat may be used on mild days to dry the air in the pit or house. Keep a sharp outlook for mildew, and use flowers-of-sulphur

wherever it is noticed. Unheated structures must be well protected from frost by several thicknesses of mats. The work of planting the flower-beds with spring-flowering hardy plants and bulbs should now be finished, and the beds mulched with Cocoa-nut fibre refuse or leaf-mould. This year *Hyacinthes*, *Crocus*, *Snowdrops*, and other bulbs are starting very early to grow. Clumps or beds of *Anemone japonica* should be afforded a dressing of decayed manure, before the stalks die off.

GENERAL WORK will consist of clearing-up fallen leaves, repairing and re-gravelling walks and roads, rolling lawns, taking-up, pricking over, and levelling the land, and relaying the turf; and in the case of lawns which are getting bare, a dressing of soil finely sifted, or of manure, if it be not objected to, may be afforded. Nothing is better for poor light land than a dressing of finely-sifted heavy loam three-quarters, and one-quarter wood-ashes or burnt garden refuse; and in the winter two or three drenchings with farm-yard manure, diluted if it be strong.

FRUITS UNDER GLASS.

By M. TEMPLE, Gardener, Carron House, Falkirk, N.B.

EARLY FORCING OF THE PEACH.—Where the early forcing of Peaches and Nectarines is practised, and there are any old trees declining in bearing, these should be removed, together with the soil in which they grew, sparing the roots of the trees on each side; and if the drainage is in good order, fill in the station with pasture or other good loam, and mortar rubbish and soot in equal ratio, making these thoroughly firm for a depth of 6 inches at the bottom of the hole, which will stop the young roots from going downwards; then put in the soil prepared for the trees. This upper portion of the soil may consist of one part in ten of charred soil or lime rubbish, well broken, but no rank manure, as it is one of the causes of canker and of gross unfruitful shoots. The total depth of soil should not be less than 18 inches, and the deepest roots should not be more than 6 inches below the surface. After planting and watering, a mulch of Mushroom-bed materials may be allowed, but no rank manure whatever. If any trees are brought into the peachery from the open walls, or the nursery, they should be in perfect health and without knotty roots. If canker is apparent on the wood, or there are snags which have been often cut back, discard such trees, healthy maiden trees being preferable. I prefer to plant early Peach trees when a Peach-house is started, as they then become fit for forcing the following year. Our houses are about to be started, which will be slowly; and the trees in this house have fruited abundantly for the past ten years, ripening in the month of May and onwards.

VINES.—The placing of a long heap of fermenting stable-dung to aid the Vines in starting is of much service, and it is a very old practice, but much mischief has sometimes been done by the material being placed directly on the soil in which are the roots of the Vines. Where there is a border in the vinery, the manure had better be placed on a wooden platform raised above the soil, if a forcing-pit does not exist in the vinery. Take the canes down from the trellis, and slightly bend the tops to a low level, so as to induce the buds to break regularly, dousing them with tepid water. Vineries which may have been closed for fifteen to twenty days may be kept at 50° at night, with an increase of warmth of 10° by day with sun-heat. Slow forcing at the beginning is productive of short-jointed wood and compact bunches. The outside borders must have careful attention. Vines in pots now started must not have an excessive amount of heat, or too much moisture, either at root or top. By day, with sunheat, the temperature may rise to 60° or 65° in the afternoon.

CUCUMBERS.—As the days become shorter, the temperature in the Cucumber-houses and pits should be proportionately reduced, and when the weather is severe, the thermometer may fall to 60° in the early morning, and need not be more at any time than 65° to 70°, except by sunheat. The moisture in the air may be also modified according as the pits are heated, by fermenting dung or hot-water pipes. The former method gives much trouble, and an ever-watchful eye must be kept on the steam always arising from the materials. Heavy cropping must be avoided, and surfacing afforded as roots come through the soil. Those in pots may require liquid manure when well established and bearing.

EDITORIAL NOTICES.

Letters for Publication.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for contributions, or to return unused communications, or illustrations, unless by special arrangement.

Plants, Fruits, &c., to be Named.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

SHOWS.

MONDAY,	Nov. 20	Rotherham and District Chrysanthemum.
TUESDAY,	Nov. 21	Dalkey (Dublin) Chrysanthemum, Manchester Royal Botanic Soc., Chrysanthemums and Hardy Fruits.
WEDNESDAY,	Nov. 22	Newbury Chrysanthemum.

SALES.

MONDAY,	Nov. 20	Important Clearance Sale of 50,000 Fruit Trees, at Perry Hill, Cliffe, near Rochester, by order of Mr. W. Horne, by Protheroe & Morris. Plants from Belgium, Roses, Ferns, Hardy Bulbs, &c., at Protheroe & Morris' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms. Dutch Bulbs, at Stevens' Rooms.
TUESDAY,	Nov. 21	Highly Important Unreserved Sale of Nursery Stock, at the Nurseries, Bagshot, by order of Messrs. John Waterer & Sons, Ltd., by Protheroe & Morris (three days).

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—41°·6.

Where not to Plant Roses.

WE all admit that the Rose should be planted in a sheltered spot, so that its foliage and lovely blooms do not get whipped to death by wind and rain, and the plant lose its branches and be generally rendered ragged and not an object of beauty; but those who have visited many gardens in this country are well aware of the vagaries of planters. There are exposed, bleak, wind-swept terraces in gardens everywhere, which owners have endeavoured to beautify with

standard and other Roses, but without avail; the Roses remain merely as a monument of misapplied labour, no change or addition of soil, manure, or anything else bringing beauty of leaf or bloom to them. We have in our mind's eye several such on terraces with a southerly exposure, the view in front stretching over many a mile of down and field. On a quiet summer day no spot is more delightful, but let the wind and rain come in furious gusts from the south-west, for perhaps forty-eight hours unceasingly, what of the poor Roses! they are but rags and shreds. And owners of gardens, when a plan of planting is their own, are often so crass as not to see it is not the gardener who is to blame for the ill-luck attending the Roses planted in such wind-swept places, but he who insisted on putting them there. A sunny spot, and an open one, is good for the Rose, but it must have shelter from the wind, or it will do no good. This shelter may be 20 or 30 feet away; or if it be high and thick, such as might be afforded by a thick belt of trees, or a thicker plantation, it may be 50 to 80 yards away. Beds of dwarf Roses are often effectually sheltered by a turf-bank 3 or 4 feet high, or a bed of American plants or other shrubs of a comparatively dwarf kind. In fact, Rose-gardens proper never look so well furnished as when they are surrounded with a continuous belt of tall and dwarf evergreen shrubs, with beds of these and deciduous shrubs sparingly introduced amongst the beds of Roses, allowing a good stretch of turf or gravel to intervene between the shrubs and the Roses; failing this, the former send their roots into the Rose-beds, greatly to their impoverishment. In this respect, American plants commit no injury.

In affording shelter, never put a Rose in a place closely surrounded by trees or shrubs, or in close proximity to a tree or big shrub. The Rose needs the fullest sunlight, and cannot bear a canopy of foliage stretching over it; and the only exceptions are the strong-growing Ayrshire Rambler and Prairie Roses, &c., which make enormous annual shoots, and really look well when allowed to ascend small trees and large bushes, and grow quite wild and unrestrained. Thus grown, they make for the outside of the supporting plant, clambering about the sunniest parts of the crown, and sending out strong shoots. The Roses of smaller growth soon become starved, and fall a prey to mildew if planted too near to trees and large-growing shrubs.

Equally as important as air, absence of overhanging shade, and complete shelter from tormenting winds, is good drainage of the land. Without this, all other efforts are useless. The soil may be clayey, but it can be lightened by the addition of road-grit, rough manure, burnt garden refuse, by working into it quick-lime, old mortar, burnt ballast, and various other substances; or, if light, it can be made heavier by the addition of clayey loam, clay rendered workable by the action of frost, and marl. For getting rid of stagnant water, pipe-drains at a depth of 4 feet are the best; and if a good outlet for the water collected in the Rose-beds or garden cannot be found, a dry well should be made, that is, an excavation some 8 or 10 feet deep, filled to the height of the inlet with gravel, clinkers, brickbats, and the like, and into this the outfall drain should be conducted.

The Shanking of Grapes. KNOWING how prevalent is the evil known as shanking in this country, we are desirous of contributing our quota to the solution of this at present inscrutable subject. Why is it that on vines in vineyards abroad

the grapes do not shank, whilst here under glass with our Muscats and other varieties, shanking takes place in spite of every supposed precaution? We have observed the behaviour of vines in a great many vineyards in Central Europe, including many varieties of dessert grapes, and even the Muscat of Alexandria. This last named variety used to be grown at Carlbarg, Graf Henkel's place, near Pressburg, as a wall grape, and we have seen very fine bunches of deliciously-flavoured grapes lying on the ground at the foot of the vines, which in September were quite ripe, as shown by their bright golden tint, and those hanging on the wall needed only a week's more sunshine to make them as ripe as those.

Now, as to the supposed cause of the non-liability to shank in these vineyard and garden grapes. Most vineyards—at least, those that we have seen, which were intended for the cultivation of grapes for wine-making—are placed on sunny hill-sides, the flavour of the wine being much finer when the grapes are grown in such situations than that made of grapes from the lowlands, however good the soil.

Sometimes the slope of the vineyard is so steep that no wheel-barrow or cart can be employed, and everything—grapes, trimmings of the vines, manure, and stakes—must be carried on the shoulders of women generally, and excessively hard labour it is, as only those know who have tramped all day long up a steep slope with $\frac{3}{4}$ cwt. in a tub carried on the back. Naturally these hill-sides have a very shallow soil, and in some districts it appears to be merely a stony detritus, all the finer particles of soil, the humus and manure lying at or near the surface being carried to the bottom of the slope, unless stopped here and there by terrace walls, as may be seen at Kloster Neuburg, the Institute for Viticulture near Vienna, about Pressburg, and in many parts of the Rhineland, Burgundy, Spain, and Italy. This loss is constantly going on, entailing much labour to the cultivator in carrying the accumulations up the hill again, and in manuring. We see, therefore, that good grapes can be grown on very shallow soils with excessive drainage, as those overlying gravel or rock, thus showing clearly enough that our deep borders of rich soil are quite needless, if not detrimental to the vine and the soil, which is accentuated by our cool summers. May not, therefore, the deep border be a contributory cause of shanking? It cannot be lack of warmth in the surface-soil or of sunlight in the vineries, as the sun's rays in our glass-houses are of greater power there than out-of-doors in the vine-lands, as is shown by the excellence of our hothouse grapes, which are never equalled by out-of-doors in any country, however favoured by climate.

Will some gardener who has to do with shanked grapes give a shallow stony border placed on a bottom impervious to water and the roots of the vine a trial for a few seasons? We might then arrive at some results in arresting shanking, for which gardeners would be profoundly thankful. Another point in which we seem to err is, in cropping too heavily vines pruned on the single-rod and short-spur method. Do we allow foliage proportionate to the excessive crop of twenty to twenty-five bunches of $1\frac{1}{2}$ to 2 lb., which it is no uncommon thing to take from a small vine? This heavy crop is, in maturing, a source of weakness in the vine that no amount of root and aerial feeding can arrest. And it is very often just at the critical point when sugar should begin to form in the berries that shanking is first observed, i.e., in the last three weeks or a month before perfect ripening. A crop of twenty-five or even twenty bunches is more than a vine restricted in quantity of foliage and rooting space can carry without lessening its vigour, at least for a long series of years; whereas, it could carry twelve to fifteen bunches for many years in succession. We know of vines in favoured soils in this country which have done as much, and are still doing it; but that only proves the rule, and these vines are notable exceptions. A vineyard vine, on the con-

trary, carries six to eight or ten bunches of grapes, and the foliage carried by the five or six summer shoots of 5 feet long that are retained is commensurate with the needs of the vine in developing and maturing a crop of this size. We do not alter the nature of a vine merely by putting it under

from what we have seen of the immunity of vineyard vines from the disease, there would appear to be good grounds for this currently-held opinion.

The grape vine is not a denizen of fat pastures, but of the lean and hungry soils of the hills and mountains, of warm, temperate, or sub-tropical

—say, cow, pig, or horse—should be partially decayed, in which condition it may come almost close to the roots; and besides solid manures, there are liquid forms which may be applied during growth.

If the hints given in the above note should induce

FIG 102.—CITRUS TRIFOLIATA: A HARDY ORANGE.

glass; but it is a question if the cultivation of the vine in this country under glass has not weakened its pristine vigour. That is another matter that only a course of experiments extending over several years would settle; and we may at length find that we have an inherited weakness in the vine to contend with. Our best writers on the vine have always considered over-cropping to be one of the causes which induce shanking, and if we may judge

countries, where it is in the main, a surface-rooting plant. It likes free exposure, and the fullest ventilation, with great sun-heat (summer-time) by day, and a comparatively low temperature by night—say, from 45° to 50°—an ample water supply in the spring and winter, and perfect drainage. The obtaining of fine bunches and berries is a question of manuring just before and during growth, and for this purpose the manure, if it be that of animals

some gardeners to make experiments with grape vines, and leave the beaten track, we may in time arrive at a better solution of the cause of shanking.

CITRUS TRIFOLIATA.—A Hardy Orange ought to find favour in this country, but nevertheless the shrub, of which we now give an illustration, is not much known. Independently of its bardiness, its singular appearance warrants its cultivation. It is a green-

branched Japanese shrub, with formidable spinea, fragrant white flowers, and tri-foliolate leaves, the latter being deciduous. At Kew it has proved hardy during the severest winters. A few miles off, on a different soil, the plant was so injured that it was removed as unsightly, though not as dead. Under ordinary circumstances, then, we believe the shrub to be perfectly hardy, as indeed it is in the more rigorous climate of Antwerp, as illustrated by specimens sent us by Mr. C. VAN GEERT. But until this year, we have not seen it produce ripe fruit. It is to Canon ELLACOMBE that we owe the privilege of figuring the fruit. Mr. VAN GEERT has also sent ripe fruit from Antwerp. The illustration tells its own tale—we have only to add that the fruit is covered with a velvety down.

LINNEAN SOCIETY.—On the occasion of the meeting of the above Society, on Thursday, November 2, Professor STEWART, President, in the chair, Messrs. W. G. AXFORD and C. H. NICHOLLS were admitted Fellows, and Mr. H. M. BERNARD was elected. The Secretary having read a list of donations to the library since the last meeting, the President moved that the thanks of the Society be given to the donors, and to Lady ARTHUR RUSSELL for the valuable collection of engraved portraits of naturalists, which she has been so good as to present to the Society in the name of her husband, the late Lord ARTHUR RUSSELL, a motion which was passed unanimously. The President then referred to the improvements which had been carried out during the recess in the Society's apartments by the introduction of the electric light, for which they were indebted to the liberality of the Treasurer, Mr. CRISP, who on former occasions had shown himself so generous a benefactor, and moved that the hearty thanks of the Society be given to Mr. CRISP for his munificent present. The resolution was carried by acclamation. Referring to the death of Fellows which had occurred since the last meeting, the President alluded especially to the Rev. LEONARD BLOMEFIELD, whose connection with the Society, extending over seventy years, had recently been made the subject of a congratulatory address; to Mr. F. PASCOE, the distinguished entomologist; and to Mr. GEORGE BROOK, whose lamented decease had caused the vacancy in the Council which they now had to fill up. The ballot having then gone round for the election of a new councillor, in the place of Mr. G. BROOK, deceased, Mr. H. SEEBORN was declared to have been elected. Dr. PRIOR exhibited a fully-developed fruit of *Pyrus japonica*, from Rogate, Sussex, seldom seen, although the plant is common enough; and alluded to its use as a conserve if it could be obtained in sufficient quantity. Mr. SPENCE MOORE read a paper on the "Phanerogamic Botany of an Expedition to Matto Grosso," upon which he acted as botanist. Starting from Cayuta, the expedition first visited the Chapada Plateau, to the east of that city, where many plants were collected. Thence a journey was made to the new settlement of Santa Cruz, on the Paraguay, about half way between Villa Maria and Diamantino. The flora here is of a mixed character, nearly 37 per cent. of the plants being common to tropical South America, upwards of 27 per cent. occurring in the N. Brazil Guiana province of Engler, with 20.5 per cent. common to that province and the S. Brazilian, and only 13 per cent. of S. Brazilian types. From Santa Cruz a party penetrated through the primæval forest lying to the north, and reached the Sierra de Saporapan. The forest flora is markedly Amazonian in character, nearly 50 per cent. of the plants being natives of Amazonia, or of the neighbouring countries within the N. Brazil Guiana province, or related thereto; while the proportion of species common to tropical America falls to rather more than 28 per cent., the S. Brazilian element being present only to the extent of 9.5 per cent. Returning to Santa Cruz, the Rio Braciato was partly explored, and the Paraguay ascended to the neighbourhood of Diamantino. The party then came down the Paraguay to the Corumba, where many plants of interest were found. The expedition was partly

disbanded at Ascension. Among the Amazonian plants found at Santa Cruz or in the forest may be mentioned *Randia Ruijiana*, *Bertiera guianensis*, the *Loranthad Oryctanthus ruficanis*, *Cattleya superba*, *Epidendrum*, *Imantophyllum*, *Rodriguezia secunda*, &c. The collections comprise close upon 700 species, of which rather more than 200 were considered to be new, and referable to eight new genera. The southward extension of the Amazonian flora to a latitude well within the Paraguay river system was regarded as a noteworthy feature.

THE TADCASTER PAXTON SOCIETY, held on Friday last, November 10, its second annual Chrysanthemum show, which was opened by H. H. Rily-Smith, Esq., and was largely attended. Although the gardeners' classes were badly represented, the show on the whole was a decided improvement. Three nice groups were put up (not for competition) by T. Fielden, Esq., Grimston Park; H. Bromet, Esq., Tadcaster; and Miss L. Bethel, Newton Kyme. The vegetables shown by cottagers were very fine; also the Chrysanthemums shown by amateurs. An Award of Merit was given to Mr. Grix, gardener to J. M. Dawson, Esq., Wighill, for a fine sport from Mrs. Shipman; also to Mr. William Green, of Garforth Nurseries, near Leeds, for his fine display of home-grown fruit.

LANTERN-SLIDES—ELEMENTARY BOTANY.—We are frequently asked where illustrations of botanical subjects can be obtained for lecture purposes. We are now enabled to answer the question, as Messrs. GEORGE PHILIP & SON, of 32, Fleet Street, London, have issued a catalogue of about 150 slides, illustrative of vegetable structures. The illustrations may be purchased or hired. The specimens themselves form the best of all illustrations, but in many cases they are not obtainable or available, and then these slides are very valuable, especially those devoted to microscopic structure.

NOVEMBER HORTICULTURAL MEETING AT GHENT.—Certificates of Merit *par acclamation* were awarded as follows:—To M. Jules Hye, for *Vanda cœrulea*, a plant remarkable both for cultivation and blooming, with two fine clusters of from fifteen to twenty flowers each, flowers very large, fully developed, of a beautiful tender blue colour; to MM. Duriez Frères, for a collection of Carnations, of which the following were the principal varieties—*Nicois*, flower white and flesh-coloured; *Jeanne Chevalier*, flower yellowish-slate, very distinct, and choice; *Madame Labrayère*, large orange flower; *Margottin père*, deep carmine, flower very large; *Raphael*, striped rose. Certificates of Merit *à l'unanimité* were allotted to M. Alex. Dallière for *Nepenthes Morganie* ×, a splendid plant bearing thirty-five well-grown and coloured pitchers, claret in hue; to MM. Edm. Vervae et Cie., for *Cypripedium Dauthieri Vervaeianum*, a valuable variety of great beauty, differing much from the types, the superior sepal is green bordered broadly with white; the two petals are yellow, the upper parts are edged with brown, the lip is a beautiful yellow. Certificates of Merit were awarded to M. Alfred Van Imshoet (*par rappel*), for *Odontoglossum Inseleyi* splendens, the lip yellow, well marked with spots of clear red, which distinguish this variety from the type; to M. L. Desmet Duvivier (also *par rappel*), for *Cypripedium Chamberlainianum*, a sturdy plant, the flower of brilliant colouring in comparison with those hitherto seen; to M. Edm. Van Coppenolle, for *Chamaerophum humilis argenteum plumosum* [?], a very dwarf variety, the fronds finely cut, very silvery underneath; to M. H. Schmitz, for *Cattleya labiata autumnalis*, bearing a fine cluster of large purplish-red flowers, the lip very dark; to M. Léon Poelman Maenhout, for *Vriesia Aurora Leodiensis*, a variety obtained by M. Maréchal, Director of the Liège Botanic Garden; it has handsomely-coloured red and yellow flower-spikes, the flower-stem has eight branches, each bearing many blooms, which is a thing rarely seen. To M. Jules Hye, for *Cattleya exoniensis* ×, the lip remarkable for its fine white and red colouring; to M. L. Desmet Duvivier, for a

species of *Encholirion*, from the red centres come red stripes, which render the leaves very beautiful; to M. Bedinghaus, for *Echinocactus Grusoni*, a fine imported specimen; also for *Aloe Greeni*, a large cluster of a hundred rose-coloured flowers; to M. F. Desbois, for *Carex japonica*, a seedling variety with elegant green leaves; *Cypripedium miniatum* (*Spicerianum* × *Fairieianum*), with the characteristics of both parents, the upper sepal and lip of *Spicerianum*, the petals of *Fairieianum*; to M. Jules Hye, for *Cattleya labiata autumnalis* var., an unusual variety, the sepals and petals rose-coloured, marbled distinctly with deeper rose, the lip very dark. Cultural Commendations were awarded to M. E. Bedinghaus, for *Abutilon Thompsoni* fl.-pleno; M. Jules Hye, for *Odontoglossum macrophyllum*, many flowers, pure white, much spotted with red; M. Jules de Cock, for *Cypripedium Haynaldianum*, with twelve fine flowers. Botanical Certificates for a hybrid of *Skimmia japonica* by *Ancuba japonica* [?], obtained by M. François Desbois; the plant is interesting because, unlike *S. japonica*, the flowers are hermaphrodite. *Ch. de B.*

THE DUTCH HORTICULTURAL AND BOTANICAL SOCIETY.—On the occasion of the meeting of the above on October 14, the Floral Committee awarded:—First-class Certificates: to Mr. C. G. Van Tubergen, jun., of Haarlem, for *Hæmanthus* sp., *Transvaal* (new plant), and *Anemone japonica*, Sieb. et Zucc., var. *Lady Ardilaun* (new plant); to Mr. G. Blankensteijn, of Heemstede, for *Begonia Baumannii hybrida* (new plant). Second-class Certificates: to Mr. C. Van Tubergen, jun., of Haarlem, for *Nerine pulchella*, Hort. (new plant); to Messrs. E. H. Krelage & Son, of Haarlem, for *Kniphofia hybrida Lachesis* (new plant), and *Cactus Dahlia Harry Freeman* (new plant); to the Nursery "Tottenham," of Dedemsvaart, for *Chamaecyparis Lawsoniana* var. *aurea nova* (new plant); to Mr. L. Duval, of Versailles (through the agency of the Botanical Garden at Leiden), for *Vriesia fulgida* (new plant). Botanical Certificates: to Mr. C. G. Van Tubergen, jun., of Haarlem, for *Kniphofia modesta*, Bkr. (new plant); and *Drimiopsis Kirki*, Bkr. (insufficiently-known plant); to Messrs. De Graaff Brothers, of Leiden, for *Kniphofia modesta*, Bkr. (new plant); to the Nursery "Tottenham," of Dedemsvaart, for *Chamaecyparis Lawsoniana lycopodioides* (new plant).

"VAGABOND."—We regret to state that, owing to ill-health, our correspondent Mr. CARMICHAEL, writing over the above *nom-de-plume*, has been advised to betake himself to the more salubrious climate of South Africa.

THE EXPORT OF FRUITS, ETC., FROM OPORTO.—Of fruits, &c., which constitute regular articles of export from Oporto, we are told by Consul GRANT in a report to the Foreign Office that Onions, Apples, and Oranges, are the goods sent in the larger quantities to the British fruit markets. London, Hull, Bristol, and Liverpool, are the ports to which these articles are shipped, the last-named taking about two-thirds of the whole amount exported. The Onion season generally commences about the end of June, and shipments are made up to February, though the bulk is made up from July to the end of September. The yearly exportation of these Onions (for the good quality of which Oporto enjoys a certain reputation) may be taken roughly at about 120,000 cases in an ordinary season; a fair quantity is also sent to Brazil. The 1892 crop was a large one, and the shipments were expected to reach 150,000 cases. The Apple crop begins about the end of June, and the average exports may be put down at between 15,000 and 20,000 cases. This season, however, owing to the crop having been an unusually large and early one, and there having consequently been more time for the shipment before the English fruit was ready for the market, the export of Apples during the latter part of June, July, and August, was about 30,000 cases. The shipment of Oranges from Oporto

has been for some years on the decline, as the fruit is of a poor kind, and unable to compete successfully with that from Valencia and other sources, the exports being, therefore, limited to a few thousand cases during the months from December to March.

ORCHIDS.—M. LUCIEN LINDEN has in the press a treatise on exotic Orchids and their culture. It will form a volume of 800 pages with numerous illustrations.

SEED MERCHANTS TO THE QUEEN.—We learn that Messrs. DICKSON, BROWN, & TAIT, seed merchants, of 43 & 45, Copenhagen Street, Manchester, have been appointed seedmen to Her Majesty the Queen.

—Messrs. DONNIE & Co., Rothesay, N.B., also desire us to inform our readers that they have been appointed seed growers and florists to the QUEEN.

"THE ORCHID REVIEW" this month is rich in hybridisation lore. It is very important that an accurate record be kept. As to the nomenclature of artificially-produced hybrids—we think there is, for garden purposes, a great deal to be said in favour of a purely vernacular system of naming. For scientific purposes, it may be well to adopt scientific names, but now that hybrids are increasing so rapidly, we think it undesirable to mix up the history of a plant with its name, and to complicate matters by a cumbersome and embarrassing system of nomenclature. Although there are some few cases where a composite name, indicative of the nature of the plant, is for a time very convenient, yet speaking generally, it is much more convenient in practice to let a name be a name, and a name only. The history, structure, and synonymy of any plant are much better dealt with separately. It is not every gardener who cares to know anything about these things, and the botanist, to whom they are of primary importance, knows where to obtain information about them.

"COTTAGE GARDENING."—We have received a copy of the second volume of this publication, which is edited by Mr. W. ROBINSON, and issued by Messrs. CASSELL & Co. In these days of allotment gardens and technical education, this publication, the cost of which is one-halfpenny weekly, should meet with a large circulation. It comprises not only cottage gardening, but poultry, bees, and simple cookery. It is exceedingly difficult in such a publication to avoid "shooting over the heads" of the readers, and to supply them exactly with what they want, but this publication is well adapted for its purpose.

COSTOS IGNEUS.—If the merits of this sub-shrubby stove plant were more generally known, it would be oftener seen, it being of easy cultivation, and its period of blooming so prolonged. We are indebted to Mr. LINDEN for its importation from Brazil. It somewhat resembles a Ginger or a Hedychium in growth, but is shorter jointed, and of sturdy habit, growing from 18 inches to 2 feet high, and as much through, and to some extent dying away in winter. A fine specimen of the plant has been in bloom in the Botanical Gardens, Birmingham, for several weeks, and will continue in flower some time longer; and the colour of the blooms is a brilliant orange, and these appear in small clusters, each bloom being 2 to 3 inches in diameter.

TOADS.—The history of toads and the ideas which have prevailed about them is very instructive, for it shows how the beliefs of one generation may be scouted by another, and again re-established on a firmer footing many years afterwards. I remember reading as a child, a story of how King John was poisoned by a friar, who dropped a toad into his wine, but sober books of natural history forty or fifty years ago, scouted the idea of toads being poisonous at all. A little while ago, however, Dr. LEONARD GUTHRIE sent me an interesting account of a wicked Italian woman whose husband was dying of dropsy. He took so long about it that his wife became tired

of the process, and thought that she would help him on. She accordingly caught a toad and put it in his wine, so that he should drink the liquid and die, but instead of doing this, to her astonishment and disgust, he completely recovered. Forty years ago this story would have been scouted as equally mythical with that of King JOHN, but now we know that it is precisely what the woman would have expected, if she had only been acquainted with the researches of modern pharmacology. For the skin of the toad secretes a poison, the active principle of which—phrynin—has an action very much resembling that of digitalis, which is the remedy, *par excellence*, for dropsy depending on heart disease. It is quite possible that, some of these days, we may get some enterprising firm advertising essence of toad as of superlative virtue for the cure of dropsy. In the same way as one formerly laughed at the idea of toads being poisonous at all, one may sneer at the exactitude with which rules were laid down for the collection of herbs, so that the witches were careful to collect the root of the hemlock at night. But the researches of SACHS, and more recently those of HORACE BROWN, have shown that starch is formed in the leaves of plants during the day, and is consumed during the night. I do not know whether a similar process goes on in the root or not, but, if so, a given weight of a plant collected during the night, would be more active than the same weight collected during the day. It is just possible, then, that SHAKESPEARE'S witches showed more wisdom in their mode of collecting plants than we moderns do, but even if this be so, we are far ahead of them in knowing the active principles to which the plants owe their physiological and remedial action. Dr. Lander Brunton in "The Pharmaceutical Journal and Transactions,"

WILLOWS.—The determination of the species of Willow is a weariness to the spirit, so that any alleviation of the difficulty is sure to be welcome. Such alleviation has been furnished, so far as regards the Atlantic American species, by Dr. GLATFELDER, who, in a communication to the fifth annual report of the Missouri Botanical Garden, utilises for this purpose the venation of the leaves. Dr. GLATFELDER is careful to point out that his scheme is not perfect. Variations occur in some cases, whilst in others, species really distinct, have the same mode of venation. The author establishes three main groups according as the secondary veins are regular or irregular—or, and here is the *crux*, partly irregular. The paper is illustrated by photographic reproductions.

CATTLEYA LABIATA.—M. LINDEN sends us a flower with four sepals, two petals, two lips, and a double column. The presumption is that two flowers are welded into one.

PUBLICATIONS RECEIVED.—*To-Day*, by JEROME K. JEROME. Price two-pence weekly. — *The New Era*, a dairying periodical, edited by the Disc Churn Co., office, 39, Coleman Street, London, E.C.

PLANT PORTRAITS.

BIGNONIA RODIGASIANA, L. Lind.—A stove climber, with opposite, stalked, simple, ovate-lanceolate leaves, mottled with white on the upper surface. The flowers are not described, but the appearance does not appear to be that of a Bignonia. It probably belongs to some quite different order, but in any case it is an attractive stove climber. *Illustration Horticole*, t. 183.

CAMPANULA MACROSTYLA, Boiss. et Heldr., *Garten Flora*, t. 1395.

CATTLEYA GUTTATA VAR. **PERNAMBUCENSIS**, Rodigas.—Flower-segments greenish-yellow, almost destitute of spots, lip with the front lobe rich crimson, edged with white. *Illustration Horticole*, t. 184.

CERASTIS CAPULI, *Revue Horticole*, November 1.

COTYLEDON QUITENSE, *Garten Flora*, t. 1396.

LYCASTE AROMATICA, *Garten*, October 28.

RHODOCHITON VOLUBILE, Neubert's, *Garten-Magazin*, n. 19, 1893.

SCHIZOCODON SOLDANELLOIDES, *Garten*, November 4. A beautiful illustration of a remarkable plant figured in our columns, April 8, 1893, p. 415.

BOOK NOTICE.

BULBS AND TUBEROUS-ROOTED PLANTS, &C.
By C. L. ALLEN. (New York and London: Kegan Paul, Trench, Trübner & Co., Charing Cross Road.)

This is an excellent guide to the knowledge and cultivation of bulbous plants, taking the term in a very wide sense—one, however, that is physiologically correct, if not morphologically unimpeachable. The author evidently writes from practical experience, and with a freshness and confidence not given to the hack compiler. The directions given are suitable to the climate of the Atlantic States of the Union, and require modification in our relatively sunless and moister climate. Mr. Allen calls attention to the circumstance that Loddiges, in the *Botanical Cabinet* as long ago as 1820, gave a coloured engraving of an almost perfect flower of the variety of *Canna* known as *Madame Crozy*. Mr. Allen is hardly correct in his reference; but after some search we find that, in 1822, in the 5th volume of the *Botanical Cabinet*, t. 449, a variety is figured under the name "aura-vittata," i.e., a name which, as Messrs. Loddiges tell us in the Index, at the suggestion of Mr. Roëcoe, they changed to *limbata*. That *Madame Crozy* has some points in common with *C. limbata* may, of course, be admitted, but no one surely can endorse Mr. Allen's statement that it is the same, or that Loddiges' figure correctly represents an almost perfect flower of *Madame Crozy*! Those who are partial to popular names, may be interested in knowing that *Muscari botryoides* is known under the name of "Baby's Breath." We hope that name will not deter any prosaic reader from doing justice to this book, which we can fully recommend to the cultivator.

KEW NOTES.

STAPELIA GIGANTEA.—The following plants of interest are now flowering in the houses at Kew:—*Stapelia gigantea*, several plants, some of the flowers measuring 12 inches in diameter; *Lonchocarpus Barteri*, a climbing Legume, from West Tropical Africa, with pinnate leaves, and large compound racemes of pink and purple flowers. It extends up a wire to the highest point in the Palm-house, mingling its rope-like stems with *Aristolochia brasiliensis*. *Crinum Hildebrandtii*, one of the most elegant of the white-flowered species from Tropical Africa, and exceptional in its growing and flowering freely under ordinary stove treatment. *Dracæna thalioides*, a plant a yard high, with an erect branched spike of greenish-white flowers; the same plant flowered last year; *Dracæna floribunda*, a handsome tree *Dracæna* from Mauritius, with a large, drooping, dense raceme of white flowers; *Xanthorrhœa quadrangulata*, a tall plant, with a charred stem 6 feet high, bearing a tuft of rush-like leaves, from which springs an erect spike like a Bullrush; *Aristolochia odoratissima*, a West Indian species, with hastate green leaves and flowers not unlike those of *A. elegans*, but less attractive; this plant was obtained from a continental nurseryman under the name of *A. Duchartrei*; *Hillia tetrandra*, a *Clusia*-like plant, with long-tubed white flowers, not unlike *H. longiflora*, figured in *Gardeners' Chronicle*, 1885, vol. xxiii., p. 527; *Dombeya Burgessii*, a robust, large-leaved shrub, not unlike *Abutilon vitifolium*, with axillary clusters of white, flowered with a crimson eye-like blotch at the base of the cup formed by the petals: it is a native of South Africa, and has lately been introduced from Barberton; *Pentas purpurea*, a new introduction from East Tropical Africa: it is not unlike the well-known *P. carnea*, but it has larger leaves, and the flowers are shorter in the tube; *Coleus Penzigi*, a succulent green-leaved species, about a foot high, with long terminal spikes of dull blue flowers. It is a native of Abyssinia, and we owe its introduction to Messrs. Dammann.

Brownia Crawfordii ×.—Several fine heads of flower have been developed by this plant during the

week. It is one of the very best of the Brownes. It is a hybrid between *B. grandiceps* and *B. macrophylla*, having been raised by the late Mr. W. H. Crawford, of Lakelands, Cork. The heads are spherical, fully 9 inches in diameter, and composed of a large number of rich scarlet flowers.

Among Orchids in flower may be noticed *Cynorchis grandiflora*, a pretty terrestrial plant from Madagascar; *Masdevallia triglochis* and *M. Carderi*, *Dendrobiums*, *Cattleyas*, *Cypripediums*, &c. There are several good forms of *Laelia furfuracea* in flower, one bearing a spike with ten flowers, and another flowers of a deeper shade of rose-purple than is usual. These plants were purchased a few months ago for *L. majalis*. By the way, is there any good reason why the plant called *L. Eyermaniana*, by Reichenbach in 1888, and supposed by him to be a natural hybrid between *L. majalis* and *L. autumnalis*, should not be called simply *L. furfuracea*?

HOME CORRESPONDENCE.

THE FRUIT-ROOM.—In many good gardens after the fruit is gathered and stored away in the fruit-room, a good deal of the interest shown in it whilst it was growing is lost to many employers, the fruit-room being a not very inviting place or one into which their friends could be shown. A good fruit-room is one in which the fruit may be tastefully arranged, properly labelled, and everything kept scrupulously clean, and then instead of interest in the fruit being lost, it would be increased. Frequently a fruit-room is too small for the fruit to be stored, and that makes matters worse. The fruit-room at this place is span-roofed, 12½ feet wide; and instead of the usual series of shelves in the middle space with a path all round, and narrow-side shelves, there are only side-shelves, which are 3½ feet wide, this leaving a space of 5 feet in width where one may stand with comfort to inspect the fruit on the shelves. *T. Turton, Maiden Erlegh.*

EARLY SEVERE FROSTS IN WARWICKSHIRE.—The thermometer in the gardens here registered on the mornings of October 30, 31, and November 1, 6°, 11°, and 11° of frost. I should like to know if it is usual to have these frosts in the early autumn, and if other gardeners in this district have experienced the same. *G. H. S., Myton Grange Gardens, near Warwick.*

PEARS IN YORKSHIRE.—I have seen several notices in the *Gardeners' Chronicle* of heavy Pears grown in the South, but nothing from the North. I send you a box by train to-day containing two Pitmaston Duchess Pears, the last I have out of seventy-eight, grown on a tree planted seven years. The two I send you weighed 27 and 28 oz. each when gathered; in ripening they have lost a fraction or two of an ounce. I also send *Triomphe de Jodoigne*, weighing 1 lb.; this is rather a new Pear, and will be a great acquisition to us, as, if carefully managed, it will come in later than *Marie Louise*. I send one taken from a graft on a spur of *Bergamotte d'Esperen*—very like the latter. I also send a North Yorkshire specimen of *Beurré Diel*, *Beurré Hardy*, and *Bergamotte d'Esperen*. *Wm. Culverwell.* [Fine specimens, the Duchess ripe and well flavoured. En.]

LATE RED CURRANTS.—The Currants which I gather to-day and send you were ripe on July 15, and they have hung on the bushes, or rather standards, till the present time. *A. Corps, Hensell, Hawkhurst, Kent.* [The fruit was of good quality, considering the length of time since it ripened. En.]

TREE GUARDS FROM VERMIN.—I have not seen anywhere a simpler method of protecting the stems of fruit trees from the attacks of hares, rabbits, &c., than was found in a large orchard the late Mr. James planted at Farnham Royal. This orchard stands close to woods and Burnham Beeches, and is surrounded by cover for vermin, and yet, so far as I have seen, his simple protectors proved most efficacious. These consisted of pieces of smallish mesh wirework, perhaps 1 foot in length, and some 2½ to 3 feet in height. Each piece was fixed round the stems of the trees, and so secured by the cut ends that it could not be readily removed. It was loose, and whilst allowing the stems full expansion, yet entirely prevented the vermin from getting any access to them. All wood protectors they could

gnaw, [but do not], and not in vain, but against wire-work they were helpless. The cost was comparatively small, and the result most satisfactory. As to tree supports, the suggestion that these should be of iron, and have at least three spreading claws, seems to indicate a costly method. The objection raised to stout wooden stakes, which are relatively so cheap and accessible, seems based on the supposition that in driving them into the ground the tree-roots might be injured. If, however, the stakes be fixed in the ground where the trees are to be planted first, that trouble is obviated. At the outset that would be the common-sense method. Then after a couple of years, when new stakes may be required, they could be fixed in the same holes as were the old ones, as, of course, the new stakes should be stouter; a secure yet loose tie with tar-cord, a small wedge of straw being inserted between the tree-stem and the stake to prevent chafing, seems to present the simplest and best possible method of supporting the trees. *A. D.*

FROST IN NOVEMBER.—Your correspondent "H. E." p. 568, will find Sir Robert Christison's open winter prognostication recorded in *The Life of Sir Robert Christison*, vol. ii., p. 207 (W. Blackwood & Sons, 1886). *R. L.*

STEERING POTATO SETS.—This spring there was a good deal of discussion as to steering Potatoes in nitrate, &c., to make them start well, and give a bumper crop; some said it did well, some said it did badly. I told my grieve to try it, and now enclose you his report, as he has just lifted the Potatoes; he tried different varieties, but the haulms of all of them in summer were most miserable, and now the crop is the same. The soil is stiff clay, well dunged for two years running with policomanure, i.e., ashes-firing, manure, &c.:—"The Potatoes at Millholme, which we steered by way of experiment last summer, have only proved, as I thoroughly expected, a real failure; first, there was not two-thirds of a crop, and of these one-third was diseased, whereas, in the unsteered ones, the crop was an excellent one of all the varieties, viz., Sutton's Abundance, Reading Hero, Magnum Bonum, Champion, it was all the same; so that, on the whole, it must be considered a failure."—Report by Mr. Robert More, Grieve to Mr. J. R. Haig of Blairhill, Rumbling Bridge, Perthshire, November 10, 1893. *J. R. Haig.*

READING HERO POTATO.—It may interest some of your readers to know that I have just lifted one root of this variety consisting of twenty-six Potatoes, and weighing 21 lb., the largest tuber being 3½ lb. in weight. I may add that we grow about 1 acre of this quality for household use, and, considering this very dry season, we have lifted an excellent crop, and the quality is all that could be desired. *T. Oldham, Stoughton Grange, Leicester.*

THE WEATHER IN SUSSEX.—The weather at the beginning of the month was very changeable. On the morning of November 1 the thermometer stood at 17°, or 15° of frost. The soil was frozen so hard that it was difficult to dig the first thing in the morning. The morning was bright, but it became dull, and then rainy. The ice was three-eighths of an inch thick. We have since had very mild weather, accompanied by showers. The rainfall, however, is still considerably below the average in this part, and the springs are very low. This morning (November 6) there was a change again to cold weather, 12° of frost being recorded. *H. C. Prinsep, Buxted Park, Uckfield.*

POTATOS AND DROUGHT.—Late varieties of Potatoes are more affected by super-tuberation ("growing-out," as it is termed) than early ones. When copious rains follow a long period of drought, the tubers of late sorts are almost certain to make a second growth. It is possible, however, to obtain a good crop of Potatoes without a drop of rain falling upon them from the time of planting to lifting the tubers. Such an occurrence as this did take place in a garden not far from Torquay last year. The variety, *Myatt's Prolific*, perfected a crop in the manner described. In deeply cultivated soil the tubers are less likely to make a second growth than in soil but lightly moved, for the simple reason that in the former, moisture is not so readily evaporated and absorbed, the tubers do not receive such a check, and do not make a second growth so early. *E.*

THE ROYAL GARDENERS' ORPHAN FUND.—Being one of the subscribers from the commencement of the

Gardeners' Orphan Fund, and after reading the note from "One of the Founders," I am not very much surprised to hear of the miserably small collection realised by the cards. For my part, I must admit that I do not approve of the card collections; it becomes a nuisance year after year to have to go begging with a card in your hand, and the public get tired of such a way of begging. I am sure more good might be done in each county by the local secretary, if he formed a local committee, and let them raise funds in the best manner they thought proper, by concerts, bazaars, flower shows and galas. I am sure more money would be forthcoming, and with a deal greater pleasure in raising the funds than by begging cards. Unity is strength, and a great deal more can be done by a body of men than by individual effort. I enclose you statement of account of a concert got up by a number of gardeners, just to show you what can be done by working together. *An Old Subscriber.*

THE BLEEDING OF VINES.—Many cultivators go in fear if their Vines "bleed," yet it is very rare that a Vine is lost from this cause, unless it be very old. There can be no doubt that the loss of sap at the time just previous to growth recommencing (and that is the only stage at which bleeding occurs) checks growth for that season; but beyond doing this, it does not usually seem to have further consequences which can be called injurious. Moreover, we seem to have here a hint as to one of the methods which may be employed to check a too-exuberant growth, and having the same results as root-pruning or lifting, which are operations that always mean root-pruning, i.e., loss of roots, however careful the gardener may be in doing the work. A check of this kind delivered to growth would mean a consolidation of wood both old and young, and there is no reason why it should not tend to better fruit-bearing, by reason of the earlier date at which such wood would ripen. It is known that tapping Conifers in order to obtain turpentine from them does not weaken them injuriously if they are planted in a soil that suits them, although it retards growth, and has a favourable effect on the timber, as has been proved by numerous tests made by the U. S. Agricultural Department. Might not some similar result occur in a Vine, Fig, &c., which bleeds? *A. Y. E.*

OSTEOMELES ANTHYLLIDIFOLIA.—This plant, referred to on p. 522, is in cultivation at Kew, where it is grown out-of-doors in summer, and wintered in a cold greenhouse. It forms a loose shrub, clothed with elegant silvery-green pinnate leaves (evergreen at Kew), and in spring it produces numerous bunches of white Hawthorn-like flowers on the ends of short lateral branches. The fruit is like that of *Coton-easter*. A figure of the Kew plant will shortly be published in the *Botanical Magazine*. Meanwhile, the following note, from Hemsley's *Botany of the Challenger*, will interest those who have obtained this plant either from Kew—where it has been propagated and sparingly distributed, or from M. Lemoine of Nancy, who includes it in his catalogue of new plants. For its introduction we are indebted to M. Cornu, of the Jardin des Plantes, Paris, who raised it from seeds sent from Yunnan by Delavay:—"Osteomeles is an outlying genus of Rosaceae, of which there are about eight or ten species inhabiting the Andes, and *O. anthyllidifolia*, which is restricted to Polynesia. This was first collected in the Sandwich Islands by Menzies, and the genus was founded upon it (Lindley in *Trans. Linn. Soc.*, xiii., p. 98). It is the only one with pinnate leaves, and is thus of very different aspect from the Andine species. Besides Cuming's Pitcairn Island specimen, and numerous specimens from the Sandwich Islands, there are in the Kew herbarium two or three from the Bonin Islands, and one from Maingai, so that it practically ranges across the Pacific. The Haw-like fruit is described as being of a pleasant flavour." Since this was written the plant has been found wild in Japan and China. A plant is being tried at Kew out-of-doors against a wall, to test its hardiness. *W. H.*

PRIMULA FLORIBUNDA.—At the Birmingham Botanical Gardens this lovely winter-blooming *Primula* is at the present time to be seen in full beauty, a quantity of plants having been in bloom in the conservatory for four or five weeks past, and will continue flowering throughout the winter. These plants are from seed sown in February last, and grown on until they could be placed in cold frames through the summer, and the plants, being perennial, can easily be kept growing on from year

to year. It needs protection from frost in winter, else it is of a hardy character, of dwarf habit, and yielding through the winter months a profusion of rich golden-yellow small flowers in clusters on short stems. Size can readily be obtained from these plants, so that strong-flowering plants can easily be obtained in a few months. *W. D.*

COMET ASTER: GIANT WHITE.

ANOTHER form of the Comet Aster strain previously introduced by Mr. C. Lorenz, of Erfurt, and said to be an improvement. The flower-heads are larger, the florets broader; the central florets are at first slender, and yellow in colour, but subsequently become white. For the illustration, we are indebted to Mr. Lorenz.

FIG. 103.—COMET ASTER: GIANT WHITE.

SOCIETIES.

ROYAL HORTICULTURAL.

NOVEMBER 14.—The meeting in the Drill Hall, James Street, Westminster, on Tuesday last, was held under very unfavourable weather. The day was damp and foggy, and in the building itself it was almost impossible to see the proper colours of the flowers. Long before the time for closing—4 P. M., the gas was lit throughout the building, and its appearance had every indication of midnight, rather than early afternoon. The principal exhibits were Chrysanthemums and Orchids, and in these were found most attraction, whilst a good collection of varieties of Celery from the Society's gardens at Chiswick, was also favoured with much attention.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. R. Owen, H. Herbat, C. T. Druery, Geo. Stevens, W. C. Leech, F. Ross, J. Jennings, C. Jeffries, W. Bain, W. Furze, T. Baines, H. Cannell, J. D. Pawle, H. Bennett-Poë, E. Mawley, G. Paul, J. H. Fitt, H. H. D'Ombraun, C. E. Pearson, Owen Thomas, C. E. Shea, and Peter Barr.

Two competitive classes for Chrysanthemums had been arranged, one for a collection of cut blooms, distinct, each bloom to be shown as cut from the plant, without dressing, and to stand well above the moss covering the box, and open only to amateurs. There were six entries, and the 1st prize went to Mr. Geo. Wythes, gr. to the Duke of Northumberland, Syon House, Brentford, for a good collection of Japanese and incurved blooms. The prize was first given to a larger and fine collection put up by Mr. J. F. McLeod, gr. to J. Spencer Morgan,

this variety, and all the others were exceptionally large. Mr. Geo. Wythes was 2nd with good blooms of smaller varieties.

Mr. Robt. Owen exhibited a capital stand of new varieties of Chrysanthemums, including some first-rate blooms. Awards of Merit were given to the following:—Wilfred Marshall, an English seedling Japanese, incurved, having extremely broad florets, large flower of a lovely pale yellow colour, centre not very full, as shown; Rose Wynne, another English seedling, having very broad florets, white, marked with red, a Japanese incurved; Golden Wedding, an American seedling Japanese of very fine rich yellow; Niveus, another white one from America, flower very full, and florets large; Robert Petfield is an English seedling incurved, and Lord Rosebery also, the latter very deep, and both promising to make capital additions to the section; John Bunyan is a capital large Anemone variety. The colour of bloom is yellow, and the cushion is slightly darker than the outer florets.

Mr. R. Parker, Impney Gardens, Droitwich, had a group of Chrysanthemum blooms, very tastefully arranged with an abundance of Fern and Ficus. The blooms were good and representative of the different sections (Silver Banksian Medal). Another collection of cut blooms came from Mr. C. E. Shea, The Elms, Foots Cray, including a few blooms of the lovely white Japanese with creamy centre, named Mdlle. Thérèse Rey, which was granted an Award of Merit. Many more of the newer ones were also included (Bronze Banksian Medal).

Messrs. Jas. Veitch & Sons, Chelsea, put up a grand group of Chrysanthemum plants, carrying capital blooms of the newer and choicer varieties, Chas. Davis, Golden Wedding, and Mdlle. Thérèse Rey, received Awards of Merit and Silver Flora Medal.

Mr. William Slogrove also staged some cut blooms of first-rate excellence, including about half-a-dozen blooms of Thunberg, as good as ever we saw it (Cultural Commendation and Bronze Banksian Medal).

Mr. W. Wells, Earlowood Station, near Redhill, showed another collection, which included a new seedling Anemone flower named Mrs. C. J. Salter (Award of Merit). The flower is very pretty, of orange-buff, and possessing a good cushion (Bronze Banksian Medal). Another collection of good blooms was staged by Mr. Geo. Wythes (Silver Banksian Medal). Messrs. James Carter & Co., High Holborn, had two Chrysanthemums, one called Rosy Giant, and the other Mrs. Christopher Moore, but no award was made.

Messrs. H. Cannell & Sons, Swanley, had a large stand containing a good number of Chrysanthemum blooms, well grown and of the newer and seedling varieties, including two that were distinguished by an Award of Merit, also shown by other exhibitors, viz., Golden Wedding and Duke of York. This latter variety, which was exhibited only by Messrs. Cannell, is a large Japanese magenta, with silver reverse. Also a quantity of flowers of Zonal Pelargoniums, arranged in bunches, including the fine double scarlet Raspail Improved, New Life, a small scarlet double, with petals striped with white; and a lot of the best of the new single varieties; Eucharis, Albion, and White Lady are all good whites; Maud of Wales, the most lovely of the pinks; Madame de Bordeville and A. F. Wootton, very fine salmon-pinks; King of the Purples—the best purple, and Sunbeam, Miller's Favourite, and Hyacinth, bright and good scarlets; Etoile de Lyon is one of the shaded varieties, very delicate rose, with shaded white centre (Silver Flora Medal).

Messrs. Jas. Veitch & Sons, Chelsea, obtained a First-class Certificate for *Dracœna Jamesii*, a pretty ornamental narrow-leaved and highly-coloured specimen. A basket containing a quantity of the dwarf-growing winter-blooming *Begonia John Heal* was also shown (Vote of Thanks); also a plant of a new tuberous winter-blooming *Begonia* called Mrs. John Heal, and obtained by crossing one of the tuberous varieties with *B. socotrana*; the plant was blooming freely, flowers were scarlet, fair size, and the plant about 12 inches high—a very interesting and promising break.

Sir Trevor Lawrence, Burford Lodge, Dorking, showed a basket containing plants in flower of the delicate and pretty *Primula Forbesii*; the spikes of small pink flowers are produced in wonderful profusion, and are about 18 inches to 2 feet high (First-class Certificate).

Messrs. Hugh Low & Co. were awarded a First-class Certificate for an ornamental *Croton*, named *Croton Russellii*.

Mr. J. Crook, gr., Forde Abbey, Chard, showed blooms of what was described as a seedling *Primula*

Esq., Dover House, Roehampton, but it was afterwards noticed that this exhibitor had duplicated one or more varieties, instead of each being distinct. The collection was therefore disqualified. It consisted of two large boxes of Japanese blooms, one of incurved, and one arranged with Pompon and decorative varieties exhibited in sprays. The 2nd prize was awarded to Mr. Thos. Oaman, Ottershaw Park, Chertsey, Surrey, who had also a meritorious collection.

In the other class, which was for eight new varieties, distinct, sent out in 1890, 1891, or 1892, the 1st prize was taken by Mr. W. Slogrove, Gatton, Reigate, who staged magnificent blooms of G. C. Schwabe, Excelsior, Charles Davis (Award of Merit), R. Flowerday, Mrs. Libbie, Wm. Seward, Mrs. Harman Payne, and Lord Brooke. The latter was the largest bloom we have seen exhibited of

obconica. Mr. W. C. Rossiter, Paignton, had a spray of a gold-variegated Rosemary.

Mr. Walter Salmon, Ivy Cottages, Elder Road, West Norwood, had a stand of tastefully-arranged bouquets, wreaths, &c. (Bronze Banksian Medal).

Mrs. Crawford, Reigate, was awarded a Bronze Banksian Medal for a collection of Chrysanthemums.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. J. O'Brien (Secretary), Dr. M. T. Masters, F.R.S.; C. J. Lucas, T. Statter, E. Hill, H. Williams, H. Ballantine, and T. W. Bond.

The Hall was brightened by several good groups of Orchids, one of the best and richest in good things being that contributed by R. I. Measures, Esq., Cambridge Lodge, Camberwell (gr. Mr. Henry Chapman), and which was specially rich in rare Cypripediums, which were arranged with specimens of *Cattleya labiata*, *Sophranitis grandiflora*, &c. Foremost among the Cypripediums stood *C. insigne Sanderæ*, and with it was *C. i. Ernestii*, of which it is the best of praise to say that it very closely approaches *C. i. Sanderæ*. It has, however, a few purple dots on the white of the upper sepal, and the tint of its clear yellow flowers is somewhat darker. Other fine Cypripediums in Mr. Measures' group were *C. insigne*, Cambridge Lodge variety, *C. × Celeus (insigne Chantini × villosum)*, *C. × Carrierii (venustum × superbiens)*, *C. insigne radiatum*, *C. × Diana (barbatum superbum ♀, Spicerianum ♂)*, *C. × Indra (callosum ♀, villosum ♀)*, *C. × Bellona (villosum × Spicerianum)*, *C. × Leeanum*, with seven flowers, and *C. Spicerianum* with ten flowers. The group was awarded a Silver Flora Medal.

Messrs. F. Sander & Co., St. Albans, staged a good group in which the varieties of Cypripedium × *Leeanum* were very fine. *C. × Leeanum James Hamilton* (Award of Merit), was perhaps the richest coloured form of it yet shown, and its flowers were of perfect shape. *C. × Leeanum virginalis* was a very fine form of the *C. × Leeanum giganteum* type. Other Cypripediums in Messrs. Sander's group were *C. × Leeanum excellens*, *C. × L. superbum*, *C. × L. reticulatum*, *C. × picturatum*, *C. × Burberryanum*, *C. × Alcides superbum*, *C. × Joseph Donat*, *C. × polystigmaticum*, *C. Chamberlainianum*. With these were arranged some three dozen plants of *Cattleya labiata*, *C. gigas Sanderiana*, *Lælia autumnalis alba*, the new and pretty white and crimson *Cymbidium pulcherrimum*; the pretty little white *Dendrobium Fairfaxii*, *Lycaste Skinnerii* alba, *Calanthe × Sandhurstiana*, *C. × Cooksoni*, *C. × rosea*, *Odontoglossum Humeanum*, *Restrepia antennifera aurea*, &c. (Silver Flora Medal).

Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, N., also had a fine group in which the beauty and utility of the hybrid Cypripediums was well exemplified. Among them were *C. × Harrisianum superbum*, *C. × Dauthieri* and its bizarre variety, *C. × D. striatum*, *C. Spicerianum*, *C. × Arthurianum*, *C. × Osbornii*, *C. insigne Wallacei*, *C. i. violaceo-punctatum*, *C. × Enfieldense*, *C. × Huybrechtianum*, *C. × vexillarium superbum*, *C. javanicum majus*, *C. tosum*, *C. × selligerum rubrum*, and that noble variety *C. × Pitcherianum*, Williams' variety. With these were skilfully arranged forms of *Cattleya labiata*, *C. Harrisiana delicata*, *Odontoglossum asperum*, *O. Harryanum*, *O. Rozlii*, varieties of *Lycaste Skinneri*, and plants of the pretty pink-spotted *Compasrettia macrolepton* (Silver Flora Medal).

Messrs. Hugh Low & Co., Clapton, staged an interesting group of Orchids, the central plant being one of their new *Stanhopea Lowii*, a striking species of the *S. ecornta* section, and differing from their pure white *S. Amesiana* in having a purple-spotted interior to the hypochile, and buff sepals and petals (Award of Merit). Another magnificent plant was one of *Cattleya Massaiana*, with three flowers, resembling *C. Hardyana*, but with white and crimson-marbled sepals and petals. The forms of *Miltonia Roezlii*, too, were fine, and the pretty *Cynorchis Lowii*, *Lælia purpurata Russelliana*, *Cypripedium bellatulum*, and forms of *Cattleya labiata* appeared to advantage (Silver Banksian Medal).

Messrs. W. L. Lewis & Co., Chase Side, Southgate, N., sent a group of Orchids, among which *Cattleya maxima*, Lewis' var.; forms of *C. Bowringiana*, *C. Warewiczii*, a very large light variety; *Dendrobium Phalaenopsis Schroderianum*, with richly-coloured flowers; *Trichosma snavis*, *Cynorchis grandiflora*, and various Cypripediums, were good (Silver Banksian Medal).

Messrs. Jas. Veitch & Son, Royal Exotic Nursery, King's Road, Chelsea, contributed a selection of

their new hybrid Orchids, the most remarkable of which was *Lælio-Cattleya × Statteriana* (*Lælia Perrinii ♂, Cattleya labiata ♀*), a very fine novelty; the flowers are as large as those of *C. labiata*, which it resembles much in the form and colour of its sepals and petals; the broad and showy labellum gives evidence of *L. Perrinii* in the deflected lip of the front lobe, which is of that rich dark purple seen in *L. Perrinii*; the base of the lip is white, with crimson lines—the whole flower very showy and attractive (First-class Certificate).

Another fine exhibit of Messrs. Veitch was *L.-C. × Pallas*, which had previously been awarded a First-class Certificate, but the plant now bearing three flowers, it seemed even better than before; it is the result of crossing *Lælia crispata* with *Cattleya Dowiana*, and its long and beautifully crimped lip, of the colour of that of *C. Dowiana*, is very striking; *Cypripedium × Euryades (Leeanum × ♀, Boxalli ♂)*, *C. × (Enone (Hookeræ ♀, superbiens ♂)*, *C. × T. B. Haywood*, *C. × microchilum*, and *C. × Leeanum* were also staged in good form by Messrs. Veitch.

T. Statter, Esq., Staud Hall, Whitefield, Manchester (gr. Mr. R. Johnson), showed a grand hybrid in *Cypripedium × southgatense superbum*, which was readily accorded a First-class Certificate. It is *C. bellatulum × Harrisianum*, and its rich yellowish-white flowers, profusely blotched with the darkest purple, make it among the very showiest of its class. *C. × Swinburnei*, Staud Hall var. (Award of Merit), a great improvement on the original; *C. × Ariadne (Spicerianum ♀, selligerum majus ♂)*, *C. × rubescens (Ceanthe superbum × Boxalli)*, and a spike of a fine form of *Lælia tenebrosa* were also shown by Mr. Statter.

E. Ashworth, Esq., Harefield Hall, Wilmslow, Cheshire, showed *Cypripedium × Ashworthia (C. Leeanum superbum × selligerum majus ×)*, and which seemed to be a remarkable improvement on *C. × Leeanum*, and very distinct and handsome, although the traces of the male parent, *C. × selligerum*, were not apparent. But the suppression of characters when hybrids are used for again crossing is not uncommon. Its upper sepal was very large, and pure white, the base emerald-green, with a few violet spots, the rest of the flower like a large dark form of *C. × Leeanum* (Award of Merit).

Frederick M. Barton, Esq., Highfield, Gainsborough, showed four hybrid Cypripediums. F. S. Moseley, Esq., Flaxley Lodge, Avenue Road, N.W., showed *Cypripedium × Regnaldianum (insigne × Siamese)*, and *Lælia Dormaniana*. E. H. Woodall, Esq., St. Nicholas House, Scarborough, sent a fine plant of *Cypripedium insigne* var. *albo-purpureum* of the *C. i. Chantini* section; G. W. Law-Schofield, Esq., New Hall Hey, Rawtenstall, Manchester, showed a fine pan, with a dozen flowers of the white form of *Pleione maculata* (Award of Merit).

Mr. Fitt, gr. Penshanger, Hertford, exhibited *Cypripedium × Leeanum*, and a plant from the same seed-capsule which had reverted very near to *C. Spicerianum*; J. Forster Alcock, Esq., Northchurch, Berkhamsted, sent *Odontoglossum Wilckeanum*; G. Hardy, Esq., Pickering Lodge, Timperley, Cheshire (gr. Mr. W. Holmes), sent spikes of good forms of *Cattleya labiata*, and a variety of *Lælia anceps*, probably *L. a. Amesiana*.

Walter C. Clark, Esq., Orleans House, Sefton Park, Liverpool, sent flowers of *Cypripedium × Wallaertianum aureum*, and *C. × Harrisianum (Harrisianum var. × Leeanum superbum ×)*; and Messrs. Linden, l'Horticulture Internationale, submitted to the committee a drawing of their new hybrid *Lælio-Cattleya × Cawenbergiana*, a very handsome plant.

Fruit Committee.

Present: Philip Crowley, Esq., in the chair; and Messrs. Jno. Lee, T. Francis Rivers, G. Tabor, T. J. Saltmarsh, W. Warren, J. A. Laing, H. Balderson, F. Q. Lane, J. Smith, R. Hogg, H. J. Pearson, and J. Willard.

The only award made by this committee was that of a Silver Banksian Medal to Messrs. H. Cannell & Sons, Swanley, for a grand exhibit of Potatoes, including seventy dishes; one of the tubers of a variety named Bruce weighed as much as 2½ lb. Mr. T. Edmunds Uckfield, Sussex, sent a dish of Apples, Edmunds' Seedling. Mr. J. Godfrey, Exmouth, sent some examples of the second growth which has taken place on Apple trees this year; such varieties as Worcester Pearmain, Grenadier, and Lord Grosvenor had fruit quite half grown.

J. T. Hopwood, Esq., Ketton Hall, Stamford (gr. Mr. W. H. Divers), showed a dish of Barnack Beauty Apples. A dish of Monmouthshire Beauty Apples came from Mr. W. Jenkins, The Willows,

Abergavenny (Vote of Thanks). Mr. J. Crook, Forde Abbey Gardens, had a dish of Coe's late Red Plum. A basket of good specimens of New Wonder Apples, grown within the 5 miles' radius, was shown by Mr. W. Roupell, Harvey Lodge, Roupell Park, S.W. Mr. J. H. Ridgwell sent tubers of four seedling Potatoes; and tubers of two others were from Mr. C. W. Howard, Bridge, Canterbury. A dish of Ladies'-finger Bananas was exhibited by Mr. John Fitt, Penshanger, Hertford; and M. W. C. Leach, Albury Park Gardens, showed some of his Leach's All the Year Round Parsley, which appeared to be very robust and large. An interesting collection of Celery, embracing two or three sticks each, of twenty-three varieties, was from the gardens of the Royal Horticultural Society at Chiswick.

Lecture on Chrysanthemums.

In the afternoon, Mr. R. Parker of Impney Gardens, Droitwich, read a paper on "Chrysanthemums." In commencing what proved to be a most practical paper on the culture of the plant, Mr. Parker compared the newer varieties with their parents, declaring that improvement had been achieved, not only in colour and size of blooms, but in habit of plant also, instancing many of the new ones as being very much more dwarf than the varieties they supersede. Small growers next received attention, and they were advised to grow only such a number as they could thoroughly look after; and further advice was given as to the propagating and culture of the plants. The lecturer recommended small plants with a large number of blooms upon them, in preference to tall plants with only a few, and these large ones. Mr. Parker then dealt with the culture of Chrysanthemums for exhibition, and said that success followed close attention to detail, and attention at the proper time, and was not the reward of some great secret that has been learned. They should be struck in December or January, and should be potted into good open compost, with but little manure. Half-inch bones were condemned either for soil or drainage, but crushed ones might be used with moderation. The lecturer recommended no particular kind of manure, as he believed that success was not obtained by using this or that, but by the proper and judicious application of that chosen. Chrysanthemums were frequently checked by chemical manure given in undue quantity. Potting should be made firm, and in moderately rich soil, and good, well-ripened, short-jointed wood would result. The plants might be top-dressed two or three times, and richer compost could then be given them. The plant required no feeding whatever until after the buds had set. Mr. Parker summarised as follows: Never coddle the plants at any period of their growth, never allow the roots to become dry, syringe freely on all bright days, use good soil, but not too rich in manure, and pot firmly.

Some further remarks were made by Mr. Owen Thomas, Rev. W. Wilks, and others.

NATIONAL CHRYSANTHEMUM.

NOVEMBER 7, 8.—On the occasion of the great November show, the Floral Committee of the above, in order to relieve the pressure of work on the opening day, November 7, met at the Royal Aquarium on the above dates, Mr. H. Ballantine in the chair, a very large number of subjects being staged for consideration, and they occupied the committee for a considerable time. First-class Certificates were awarded to Golden Wedding, an American seedling, rich golden yellow in colour, the petals broad and long, deep and fully double, a Japanese variety of great excellence from Mr. W. J. Godfrey, nurseryman, Exmouth. This variety was also shown by other exhibitors, but as it is the rule of the National Chrysanthemum Society the Certificate should be awarded to the exhibitor of the best blooms, it went to Mr. Godfrey, whose examples were very fine. The same award was made to single Japanese Elsie Neville, a remarkably fine and striking variety, bright orange-red, with a golden disc, from Mr. W. Seward, The Elms, Hanwell, who had other seedlings of his own raising, of a decidedly promising character. To Pompon Anemone Mrs. C. J. Salter, somewhat large in size, and self-coloured, golden-buff; from Mr. W. Wells, Earlswood Nurseries, Redhill, Surrey. To Japanese Colonel Chase, an American variety, delicate blush, with a deep citron centre, very fine and distinct, from Mr. E. Beckett, gardener, Aldenham House, Elstree, Herts. To G. W. Childs, a crimson

Japanese from America by Mr. H. J. Jones, Lewisham. To Japanese Rose Wynne, a large broad-petalled delicate pink variety, a little thin in substance. To Anemone-flowered John Bunyan and W. W. Astor, two very promising buff-coloured varieties, quite distinct, from Mr. Robert Owen, nurseryman, Maidenhead. Also to Carnation Mrs. Leopold de Rothschild, an improved Miss Jolliffe, almost a perpetual bloomer, excellent habit, very free, the flowers opening pale pink, deepens with age to pinkish-rose, very fragrant, and does not split its calyx until the flowers become old, and then not to any great degree, from Messrs. W. Cutbush & Son, nurserymen, Ilhgate. A bloom of a very fine large-flowered Japanese Anemone, named Ernest Gaille, was shown by Mr. Ives, gr. to E. C. Jukes, Esq., Hadley Lodge, Barnet, will be certain to secure a Certificate when two blooms are shown; Duke of York, a large incurved Japanese, amaranth-crimson, with a silvery reverse; from Messrs. H. Cannell & Sons, Swanley, narrowly escaped obtaining a Certificate; William Mease, a large Japanese, like W. Tricker, but not so bright, the committee wished to see again. A Commendation was given to a very fine bright-coloured spike of *Renanthera coccinea*, from Mr. Joad of Patchbury.

SOUTHAMPTON CHRYSANTHEMUM.

NOVEMBER 7, 8.—The committee of the Royal Southampton Horticultural Society again held an autumn exhibition in the Victoria Hall after a lapse of several years, which had occurred from lack of funds. From the exhibitors' point of view the show was a success, and we hope it may so prove financially. Cut blooms was the more important part of the show. Mr. Ingfield, gr. to Sir J. Kelk, Bart., Tedworth, Marlborough, won easily the 1st prize for twenty-four cut blooms, half of which were Japanese and half incurved; and Mr. Hughes, gr. to A. Baring, Esq., Norman Court, was 2nd.

The best twenty-four, not to consist of more than two of any one variety, were those shown by Mr. Ingfield, 1st; 2nd, Mr. Hughes. The first-named was likewise the winner of the 1st prize in the classes for twelve incurves and twelve Japanese varieties; with Mr. Hughes as 2nd in each.

The best specimen-plants were shown by Mr. Rose, gr. to Dr. Alden, The Firs; and by Mr. Caer, gr. to W. A. Gillett, Esq., Fair Oak Lodge.

Mr. Busby, gr. to F. Willan, Esq., Thornhill Park, had the best group of Chrysanthemums.

A creditable group of miscellaneous plants was shown by Mr. Peel, gardener, Sidford Lodge. Fruit was abundantly shown.

THE BRIXTON, STREATHAM, AND CLAPHAM HORTICULTURAL.

NOVEMBER 8.—The thirty-fourth annual exhibition of this well-known Society was opened on the above date at the Town Hall, Streatham, by the president, T. Gabriel, Esq., J.P., and Mrs. Gabriel. The numerous special prizes attracted keen competition. Those offered by Miss Sherwood for baskets of Chrysanthemums, &c., were awarded to Miss Ethel Whittard, Mrs. Stragnell, and Miss C. Hicks. The *Gardeners' Magazine* Medal went to Mr. Cherry, gr. to Mrs. Gabriel, Norfolk House, for six plants of Chrysanthemums. The prizes offered by the president for broad-petalled incurved Japanese Chrysanthemums were gained by Mr. Mursell (gr. to Mrs. Burton), Mr. T. Stevens (gr. to B. F. Smith, Esq.), and Mr. Howe (gr. to H. Tate, Esq.), in the order named. Those offered by Mrs. Fletcher Bennett for collections of vegetable went thus:—Mr. Pearce (gr. to Mrs. Bennett), Mr. T. Stevens, Mr. Ouseley (gr. to R. Lyell, Esq.), and to Mr. Cherry. The prizes offered by the same lady for Black Alicante Grapes, were won by Mr. Howe, Mr. Pearce, and Mr. Guyett (gr. to Thos. Gabriel, Esq., J.P.). The special prize offered by C. T. Cayley, Esq., for a group of Chrysanthemums, was awarded to Mr. Mursell.

For twelve cut blooms of Japanese Chrysanthemums exhibited as grown, the prizes offered by J. Margetson, Esq., were won by Mr. Howe, Mr. T. Stevens, and Mr. Mursell. The special prize offered by Messrs. John Peed & Son for Primulas went to Mr. Mursell. Messrs. Peed also offered prizes for six dishes of Potatos, which were awarded to Mr. Pearce and Mr. Ouseley. The special prizes for Palms offered by Mr. J. W. Silver were gained by Mr. Guyett and Mr. Ranson, gr. to John T. Gabriel, Esq. The special prizes for Black Hamburg Grapes offered by N. N. Sherwood, Esq., were awarded to

Mr. Mursell, Mr. Surman (gr. to W. Glover, Esq.), and Mr. Ouseley.

The numerous prizes of the society were the subjects of keen competition, and the exhibits of Chrysanthemums, Orchids, stove plants, Ferns, fruits, and vegetables were remarkably fine.

The Certificates of the National Chrysanthemum Society were awarded to Mr. Cherry and Mr. Howe. The society's Certificates were given to W. Roupell, Esq., for Muscat Grapes and Cox's Orange Pippins. Awards of Merit were given to Dr. Stragnell, for six cut blooms of Japanese Chrysanthemums; and to Messrs. John Peed & Son for bouquets and a collection of Apples; also to Mr. J. W. Silver for floral designs, to Mr. Ranson for *Cattleya labiata superba*, to Mr. Guyett for *Asparagus deflexus*, and to Mr. Owden for six cut blooms of *Vivian Morel*. The judges were Messrs. James Hudson, Charles Gibson, W. Bates, and G. W. Cummins.

TORQUAY HORTICULTURAL.

NOVEMBER 8.—This exhibition was held on the above date in the Bath Saloons. Owing to a variety of circumstances, and especially the great reduction of the number of prizes in the cut-bloom classes, there was a great falling off in the competitions, but the nurserymen of the locality came to the rescue of the Society, making an excellent display. For cut blooms, Mr. Foster, gr. to Hammond Spencer, Esq., was 1st, with a splendid lot of blooms in the class for eighteen Japanese and eighteen incurved. Mr. Veale, gr. to the Rev. A. H. Simons, was very successful in most of the classes, staging a lot of very creditable blooms.

The groups were not quite so good as usual, probably owing to the very dry season, and very trying for the Torquay district.

Fruit and vegetables were very good.

BROMLEY (KENT) DISTRICT CHRYSANTHEMUM.

NOVEMBER 8.—The exhibitors were numerous and tested the staging accommodation of the hall to its fullest extent, an overflow of vegetable exhibits being shown in the corridor.

The exhibits were generally speaking, of unusual excellence. This was particularly noticeable in the three classes devoted to Chrysanthemums grown naturally, J. Blackburn obtaining 1st prize in each class. Mr. Shoesmith, gr. to Mr. Hodgson, Croydon, succeeded in obtaining the Silver Cup presented by the Society for thirty-six blooms, distinct varieties, eighteen incurved and eighteen Japanese. This class was productive of keen competition and unusual interest. The 1st prize for a collection of Chrysanthemum plants, grouped for effect, within 50 square feet, was obtained by G. Buister, whose grouping was very effective. A pleasing variety to the brilliant colours was afforded by the groups of flowering and foliage plants; the competitors for this class were not very numerous, but that obtaining 1st prize, exhibited by J. Lyne, was the most artistic both in arrangement and selection.

The light at the Grand Hall was very defective, which must have added materially to the arduous duties of the judges.

BATH.

NOVEMBER 8, 9.—At this show plants generally were not quite so numerous as at previous shows, nor were they up to the usual standard of excellence.

For six Chrysanthemum plants, distinct varieties, and grown standards, Mr. Southard, gr. to W. J. Brown, Esq., was 1st, with creditable specimens. The same exhibitor had also the finest specimen plant in a well-trained and flowered plant of Mrs. George Rondle, about 6 feet across the flowers, of fine size, evenly distributed, and fresh. The Medal of the National Chrysanthemum Society was deservedly awarded to this exhibit. For six plants for conservatory decoration, 1st Mr. Southard, staging dwarf, well-trimmed plants of Princess of Wales, Mrs. Dixon, Dr. Sharp, Blanche Pigny, Mrs. G. Rundle, and Lord Wolseley.

Groups of Chrysanthemums.—Out of three groups, each covering a space of 12 feet square, Mr. W. Davis, gr. to S. P. Budd, Esq., was a good 1st. Mr. Tate, gr. to W. Humphrey, Esq., was 1st for a group of miscellaneous plants edged with *Panicum variegatum* and Maidenhair Fern, and tastefully arranged.

Mr. R. B. Cater was easily 1st for an effective bank

of miscellaneous plants on a length of staging consisting of Crotons, Caladiums, Dracenas, Pandanus Veitchii, various Palms, Orchids, Maidenhair Fern, and with the front of the staging completely covered with the trailing shoots of *Panicum variegatum*. It had a very pretty effect. Among the Orchids employed in the arrangement were well-flowered pieces of *Dendrobium Phalaenopsis Schroderianum*, *Odonoglossum grande*, *Cypripedium ignis* (having sixteen good slippers), and *Cymbidium Mastersii*, with ten of its beautiful white flowers open.

Orchids.—For six plants, of not less than three varieties, 1st Mr. J. T. Holmes, with three plants of *Cattleya labiata*, two of these having sixteen and seventeen well-developed flowers each, of good form and colour; *Dendrobium formosum*, *Cattleya gigas*, with eight flowers, and C. Bowringiana having four spikes supporting from five to six brightly-coloured flowers each. Mr. R. B. Cater was 2nd, his half-dozen plants including a finely-flowered *Oncidium Forbesii*, having two spikes—one containing twenty-three large flowers, *Dendrobium Phalaenopsis Schroderianum*, and *Vanda coerulea* having a spike of its beautifully sky-blue flowers (nine) open. Mr. Holmes was 1st for a single specimen, showing a well-flowered plant of *Cattleya labiata*.

Table Plants were shown largely and well. 1st, Mr. Stragnell, gr. to W. H. Long, Esq., M.P., Rood Ashton Park, Trowbridge, showing two Crotons, two Pandanus Veitchii, and two Dracenas, about 20 inches high each, in 6-inch pots, being model plants for table decoration in every way.

Cut Flowers.—These made a fine display. The chief prize for twenty-four blooms of Japanese Chrysanthemums, distinct, being £5. Five good stands of blooms were put up in this competition. Mr. John Aplin, gr. to W. Meath Baker, Esq., was 1st, with large, excellent blooms; and Mr. P. Mann, gr. to W. H. Laverton, Esq., Leighton House, Westbury, was a good 2nd; and Mr. Robinson, gr. to Lord Justice Lopes, Westbury, was a close 3rd.

Eight stands of twelve Japanese, distinct, were staged, Mr. P. Mann securing the premier position with uniformly large, excellent blooms.

Incurved varieties, twenty-four blooms, distinct varieties.—Out of seven stands staged, Mr. John Aplin secured 1st place with good all-round blooms of Lord Alcester, John Lambert, Lord Wolseley, Golden Empress, Empress of India, Lady Dorothy, Hero of Stoke Newington, &c. Mr. Copp had the best stand of twelve blooms, distinct varieties, in a good competition. Mr. Robinson had the best dozen blooms of large-flowered Anemones.

Premier Bloom in the Show.—A bloom of Mrs. Robinson King secured the National Chrysanthemum Society's Medal for Mr. John Aplin.

Fruit made a fine show of itself, the Grapes, Apples, and Pears shown in the several classes set apart for them being everything that could be desired.

Grapes.—Four stands of four bunches, in not less than two varieties of Grapes, were staged in competition for the premier prize in the Grape classes. Mr. William Taylor, gr. to Mr. Alderman Chaffin, Bath, taking 1st honours with Muscat of Alexandria, medium-sized compact well-coloured bunches, and fine specimens of Black Alicante, two bunches of each; Mr. William Nash, gr. to the Duke of Beaufort, Badmington, Chippenham, was a good 2nd.

In the Black Alicante three-bunch class, three grand clusters—the centre one being about 8 lb., and the other two about 5 lb. and 6 lb. each—were shown from the vineries of Miss Marriott, Henrietta Park, near Bath. The berries were of good average size, and beautifully coloured. Mr. Nash was 1st in the class for any other black Grape than Alicante, with perfect bunches of Gros Colmar; Mr. Taylor being 2nd, with Gros Maroc.

Three stands of Muscat of Alexandria were shown, but the bunches were loose, and the berries somewhat shrivelled.

Apples and Pears (about 240 dishes of the former, and 55 dishes of the latter), were shown in fine condition, the fruits being of good size, well selected, perfectly free from blemish, even and highly coloured. Out of twenty-five exhibits of four dishes, six fruits to a dish, Mr. H. Taylor was 1st, with perfect fruits; Mr. E. Hall had the best out of twenty-nine dishes, eight fruits to a dish, staging grand uniform well-coloured fruits of King of the Pippins. Mr. John Ricketts, in a competition of forty-seven single dishes of culinary varieties, was 1st with grand fruits of Emperor Alexander. Out of seventeen dishes of ripe Pears, eight fruits to a dish, Mr. E. Hall was a good 1st with extra fine fruits of Beurré Diel.

Collections of Six Kinds of Dessert Fruit (Pine excluded), were shown by Mr. Nash, Mrs. Gouldsmith's gardener; and Mr. Gibson, gr. to Earl Cowley, Draycot House, Chippenham, who took the prizes in that order.

Miscellaneous Exhibits.—Messrs. George Cooling & Sons, Bath, and Mr. A. Walters, Kensington Nurseries, Bath, contributed good banks of decorative plants, including Heaths, Crotons, Dracaenas, Orchids, &c., and which, being tastefully arranged, had a very good effect when viewed in connection with the banks of cut flowers, &c., close by.

ROYAL MIDLAND FARM-ROOT AND VEGETABLE SHOW, LEICESTER.

NOVEMBER 8, 9.—The well-known firm of Messrs. Harrison & Sons held their annual show on the above dates, by kind permission of the Leicester Corporation, in the Market Hall, and liberal prizes are offered by the firm for various roots and vegetables grown from seed supplied by them. Fine heads of Harrison's Leicester Red Celery, and Harrison's Early Rose, an excellent early kind, were shown. The competition was strong in this class, and in that for the Carrot, the latter being of very fine quality, especially the Selected Intermediate. Of this form of Leeks it would be impossible to speak too highly. The whole of the exhibits of the sixteen competitors were of high order of merit. There were good specimens shown of Autumn Giant Cauliflower, but the competition was not quite so strong in this class. Savoy as usual were represented in great numbers, and some were very large. Brussels Sprouts were also of excellent quality, and the competition was keen, as it was in the competition for Onions and Beetroot. Amongst the varieties of Beetroot might be seen some fine-shaped specimens of Cheltenham Green-top. Potatos, of course, take a prominent part in the show, and some very fine tubers were staged by various exhibitors.

Farm-roots were of very fine quality, considering the unpropitious season, but we can scarcely suppose that the samples seen were indicative of the usual run of the crops.

GUILDFORD CHRYSANTHEMUM.

NOVEMBER 8, 9.—The ninth annual exhibition was held in the County and Borough Halls, at Guildford, on the above dates, and was an improvement on all previous exhibitions. This Society is affiliated with the N. C. C., and is managed by an efficient staff. There were three non-competitive exhibitors, viz., Messrs. Hart & Son, who showed fruit, flowers, &c., vegetables, all excellent of their kind, and a big group of plants, consisting of Palms, Crotons, Dracaenas, Ferns, mixed with flowering plants in variety. The other exhibitors were Mr. Pullen and Mrs. T. J. Hireson, who showed stands of floral ornaments, fruit, &c.

In the class for the best group of miscellaneous plants, the prizes went to Mr. Gilbert, gr. to the Rev. J. R. Flood; Mr. Cook, gr. to the Rev. F. Poynton; and Mr. Lampard, gr. to J. Anderson, Esq., in the order named.

The contest for the best Chrysanthemum groups was exceedingly keen, the groups of plants showing good cultural skill, and they were effectively arranged. The 1st prize, a Cup, value 5 guineas, was awarded to Mr. Paddon, gr. to Col. Ricardo, and Mr. Cook taking 2nd. Mr. Pullinger, gr. to General Waterfield, and Mr. Lampard were respectively 1st and 2nd in the smaller group class.

The best feature of the show was the cut blooms, and the 1st prize for twenty-four Japanese, distinct varieties, for which there were six entries, was taken by Mr. Paddon, with some of the best old and new varieties. Mr. Nash, gr. to C. J. Ramsden, Esq., showed the best twelve blooms of Japanese, Mr. Paddon being 2nd. For six blooms of Japanese, there were eight competitors, Mr. Barrow, gr. to Mrs. Hugonin being 1st, and Mr. Clark, gr. to F. Arbuthnot, Esq., 2nd. Two competed in the class for eighteen incurved varieties, and here also Mr. Paddon was 1st with excellent blooms, with Mr. Powell as 2nd. The first-named exhibitor was likewise 1st in the class for twelve blooms, and Mr. Tucker 2nd. In the smaller classes the competition was keen, and rivals numerous.

The amateurs' and cottagers' exhibits were very good, and the groups of plants and the cut flowers of the former remarkably so.

Some fruit was shown, as well as much flowering stuff and small foliage plants.

BOURNEMOUTH CHRYSANTHEMUM.

NOVEMBER 8, 9.—The above Society held its exhibition in the winter gardens of the Hotel Mont Doré, on the above dates.

Cut blooms.—For thirty-six, eighteen Japanese and eighteen incurved blooms, a Silver Challenge Cup, value £10 10s., was 1st prize, together with a money prize. This was won by Mr. N. Molyneux, gr. to J. C. Garnier, Esq., Rooksbury Park, Fareham, with excellent fresh-looking blooms of the finest varieties, C. Davis, Lord Brooke, Vivian Morel, Etoile de Lyon, Gloire du Rocher, Golden Bronze, Col. C. B. Smith, incurved, Empress of India, Golden Empress, Queen of England, John Lambert, M. A. Haggas, and Mrs. Robertson King. A Medal, offered for the most meritorious exhibit in the show, was also awarded to this stand of blooms. Mr. Thomas Wilkins, gr. to Lady Guest, Inwood House, Henstridge, was the winner of the 2nd prize. There were eight competitors in the above class.

Out of four stands of twelve distinct Japanese varieties, Mr. T. Wilkins was 1st, staging five blooms. Three good stands of twelve blooms, incurved, distinct varieties, were shown, and here Mr. N. Molyneux secured the 1st place, with blooms uniformly good. Mr. W. J. Grace, gr. to W. A. Neave, Esq., Fordingbridge, had the best stand of Anemones, twelve blooms in not less than eight varieties. Mr. W. Woodford, gr. to Mrs. T. Goff, Lymington, had the best twelve reflexed blooms in eight varieties. Mr. Arthur J. Allsop, gr. to Viscount Portman, Bryanstone, Blandford, had the best specimen incurved bloom; and Mr. T. K. Ingram, the Nurseries, Parkstone, showed the best Japanese bloom, staging a grand one of Mrs. Alpheus Hardy.

Local Classes.—Mr. G. W. Taylor, gr. to Mrs. Elphinstone, Christchurch, was 1st for twelve incurved blooms, distinct varieties; and he had also the best twelve Japanese, thereby winning the two Silver Medals offered by the National Chrysanthemum Society.

Groups.—The best group of 60 square feet was won in the open class by Mr. T. K. Ingram, with very well-grown, well-furnished dwarf plants; and the Silver Cup was very properly awarded to it. Three good groups (local classes) of 50 square feet were arranged in competition for the Silver Challenge Cup, value 6 guineas, and the winners were Messrs. Eldridge, J. Stretch, and C. W. Barrett, and to whom the three prizes were awarded in the order of their names.

Fruit was on the whole well shown, and consisted of Apples, dessert Pears, black and white Grapes. Vegetables were shown in large quantities, including some for prizes offered by leading seedsmen. Cottagers were not forgotten in these classes, and their productions were generally good.

FINCHLEY CHRYSANTHEMUM SHOW.

NOVEMBER 9, 10.—A successful show of a small character was held on the above days at this suburban village. There were the usual shows of cut blooms, of groups, of specimen plants, of fruit, bouquets, table plants, &c. The principal prize-winners were Mr. D. Hayter, gr. to Tenterden Hall, Totteridge, for cut blooms and table plants; Mr. Walker, gr. to Goldbeaters, Mill Hill, for a collection of fruit; Mr. Eason, gr. to B. Noakes, Esq., Highgate, for specimen plants. Other prize-winners were Messrs. Sandford, Burch, Cooke, Wooster, and Page.

WINDSOR.

NOVEMBER 10.—Mr. Finch, the hon. secretary, deserves great credit for the manner in which he managed the details of this successful show. There was but one class for groups of Chrysanthemums, and five growers competed, the 1st prize falling to Mr. J. Edge, gr. to Lord Harlech, Ascot, with well-grown dwarf plants, carrying excellent blooms and foliage; 2nd, Mr. H. Wood, gr. to Lord Boston. Mr. N. Skeet, gr. to Sir H. D. Gooch, Bart., Windsor, was the only exhibitor of specimen plants, and he had some grand examples of Japanese and incurved varieties, neatly trained and well-flowered.

Cut Blooms.—Mr. Thorne, gr. to Major Joicey, Sunningdale Park, Ascot, was 1st in the class for thirty-six. Mr. J. Williams, gr. to F. Ricardo, Esq., Ascot, was 1st for twenty-four incurved in not less than eighteen varieties. Mr. G. Lane with a really good lot of blooms, won the premier award for

twelve varieties. Mr. Skeet, with Mrs. Heales, won 1st place for six of any one incurved variety. For twenty-four blooms (Japanese), there was a strong competition, and Mr. A. Sturt, gr. to N. L. Cohen, Esq., Ascot, won the 1st prize, Mr. Williams following. Mr. E. Johnson, gr. to A. Gilliat, Esq., Windsor, was 1st for twelve distinct varieties with flowers that were perhaps the best in the show. Anemone-flowered varieties were well represented, as were reflexed flowers. Messrs. Sturt and Williams winning in the former, and Messrs. Popple and Thorne in the latter class.

DEVON AND EXETER HORTICULTURAL.

NOVEMBER 11.—An exhibition of Chrysanthemums of a most successful character was held in the Victoria Hall, Exeter, on the date above given. The entries were so numerous on this occasion that other rooms besides the Victoria Hall were requisitioned to enable the exhibits to be staged, the quality of the plants, cut flowers, and fruit was much above the average—in fact, the groups of Chrysanthemums arranged for effect were most excellent. The 1st prize in each class fell to Mr. Rowland, gr. to W. Brock, Esq., also in that for the group for miscellaneous flowering and foliage plants. His plants were in every case fresh, well-grown, with perfect foliage, and the usual arrangement of Chrysanthemums in groups was departed from, and the evenly packed method gave place to the more irregular style of arrangement which Mr. Rowland manages so well.

Cut Flowers.—Competition in the classes for cut flowers was keen in every case, and brought together a grand display of bloom, that has never been equalled at Exeter. In the Cup class for thirty-six Japanese varieties, distinct, there was a great number of competitors. Mr. Foster, gr. to Hammond Spencer, Esq., Teignmouth, came off victor with a splendid lot.

Groups.—For groups of Chrysanthemums in pots, not fewer than eighteen varieties, arranged for effect in a circle having a diameter of 9 feet, Ferns and other plants for the bordering, Mr. Rowland 1st, and the National Chrysanthemum Society's Certificate; 2nd, S. Rogers, gr. to G. Randall Johnston, Esq.

Groups of Chrysanthemums, with foliage plants, arranged for effect: 1st, Mr. Rowland, and 2nd, A. C. Williams, gr. to W. C. Simon, Esq.

For a miscellaneous group of plants: 1st, Mr. Rowland; 2nd, A. C. Williams. Mr. Rowland also took 1st prize for Bouvardias and Poinsettias.

Cut Blooms.—For thirty-six Japanese varieties, distinct (Silver Cup and National Chrysanthemum Society's Certificate): 1st, Mr. Foster, gr. to H. Spencer, Esq., Teignmouth, which included Vivian Morel, Sunflower, Colonel Smith, C. Schwabe, Golden Wedding, Beauty of Exmouth, Robert Owen, Excelsior, Mr. Bromhead, Dorothé Shea, W. K. Woodcock, Princess May, Y. P. Audiguier, C. Blick, W. Lane, Violet Ross, Marie Hoste, Mrs. L. Allen, Mrs. G. Jameson, Lizzie Cartledge, Mr. A. H. Neve, F. Davis, Puritan, Mr. R. C. Wheeler, Ruth Cleveland, J. S. Dibbin, Mrs. E. D. Adams, Gloire du Rocher, Madame Baco, Boule d'Or; all in excellent condition. 2nd, Mr. Dawkins, gr. to W. H. Flower, Esq., Taunton.

For the best eighteen Japanese varieties, distinct: 1st, Mr. Jas. Lloyd.

For the best twelve Japanese varieties, distinct: 1st, Mr. W. H. Veale, gr. to Rev. A. H. Simons. Mr. Hawkins had the finest six white with Beauty of Exmouth; Mr. Veale being 2nd best with Florence Davis. Mr. Veale had the best six Japanese yellow in W. H. Lincoln. The best six of any other colour were shown by Mr. Hawkins with E. Molyneux. The best Japanese flower in the show was Robert Owen, shown by Mr. Style.

The best twenty-four incurved varieties, distinct, were shown by Mr. Foster; and the 2nd best by Mr. Jas. Lloyd.

The best incurved variety was Baron Hirsch, a beautiful specimen, shown by Mr. Style.

For twelve reflexed varieties, distinct, Mr. Heath was 1st. For twelve Anemone-flowered varieties, distinct, Mr. Protheroe, gr. to Mackenzie Bradley, Esq., was 1st.

The fruit classes, as might be expected, were well-filled, more than a thousand dishes were staged; and as this season the fruit has assumed more colour than usual, and ripened earlier than usual, the display of Apples and Pears was magnificent.

Amateur Classes: Cut Flowers.—Mr. G. B. Lansdale and Mr. Crabbe shared the honours between them with very creditable exhibits.

Miscellaneous.—The county and Exeter nurserymen, and some from Herefordshire and Somersetshire, contributed much fruit, decorative plants, cut blooms, new varieties of Chrysanthemums, Carnations, &c.

EASTBOURNE.

NOVEMBER 14, 15.—About sixty classes were well represented. Pretty and varied as the autumn queen is, a few Ferns have a grand effect among the blooms, oftentimes far too closely packed to do them justice.

For a group 10 feet by 6, to consist of Chrysanthemums only, Mr. J. Carpenter, gr. to H. Dewhurst, Esq., Highfield, was 1st, with a very pretty lot, containing some really good specimens, and a grand selection of colours; Mr. J. Morley and Mr. J. Burr following. For a group of similar dimensions, but with a bed of Ferns to aid the appearance, Mr. T. Fuller, gr. to J. Hooke, Esq., who had an exceedingly pretty combination, was 1st, and Mr. J. Jupp, gr. to G. Boulton, Esq., 2nd.

Specimen plants were fairly well represented, Mr. Carpenter having very good examples of Mrs. Dixon, Peter the Great, Source d'Or, and another, which easily gained the 1st prize. Other prize-winners were Messrs. C. S. Archer, Brooker, Jupp, Morley, Griffin, and Fuller.

Cut Flowers.—Thirty-six blooms, eighteen Japanese and eighteen incurved, placed Mr. Jupp 1st; Mr. J. Blake, gr. to F. C. S. Roper, Esq., was a good 2nd; the 3rd prize going to Mr. Griffin. Mr. Blake was awarded 2nd for twenty-four incurved, and was the only exhibitor, although other classes were well represented. Other prize-winners were, Messrs. Jupp, Holding, Blake, Griffin, Fuller, Mills, and Archer.

Fruits and vegetables were very prominent, and fairly good, the collection of culinary Apples from Mr. Morley, gr. to J. G. Langham, Esq., being first class. Mr. Morley was also 1st for six dishes of dessert Apples.

Mr. W. Breach was 1st for a collection of vegetables in the open class, and also in that confined to amateurs; both lots were clean, and of first-rate quality and size, without coarseness.

BECKENHAM.

NOVEMBER 14, 15.—Mr. Thos. Crosswell was awarded the majority of First Prizes, which included a Silver Medal and Certificate of Merit. The 1st Prize for three button-holes was awarded to C. Boatwright, who received also 1st prize in classes 27 and 28 for two bunches and one bunch of Grapes respectively; he was, in addition, highly commended for his groups of miscellaneous plants. First prize in classes 16 and 17 for ladies' sprays, and class 21 (four Palms), Mr. Webster. A good selection of Plants was exhibited (not for competition), by J. Laing & Sons.

PLYMOUTH.

NOVEMBER 14, 15.—Cut blooms formed the most attractive part of the show. For forty-eight specimens, in not fewer than thirty-six varieties, half Japanese, and the remainder incurved, £15 was offered for 1st prize, with other prizes of proportionate value. Mr. N. Molyneux, gr. to J. C. Garnier, Esq., Rooksbury Park, Fareham, Hants, beat the Messrs. Drover, nurserymen, Fareham, by a trifle for premier place. The Japanese possessed much quality; the most striking blooms were Mdlle. M. Hoite, Princess May, G. C. Schwabe, and Etoile de Lyon. The incurved were not large, but of perfect symmetry, and as fresh as possible.

In the class for twenty-four incurved, Messrs. Drover won with faultless blooms; Mr. N. Molyneux followed uncomfortably closely.

For twenty-four Japanese, Mr. Stiles, gr. to Miss Fripps, Teignmouth, won with a stand of noble blooms.

For twelve, Mr. Molyneux gained the premier award with a level lot of blooms.

For six blooms of any white variety, Mr. Veale led with Florence Davis; Messrs. Drover 2nd.

Mr. Stiles, with Vivian Morel, won premier position for six, any coloured variety; Mr. Foster 2nd.

Mr. N. Molyneux, with Mdlle. M. Hoite and Etoile de Lyon, won for six, any two varieties; Messrs. Drover 2nd.

Anemone and reflexed were but moderately shown. Groups of Chrysanthemums were represented by nine collections. Mr. F. Upsher, 18, Connaught Avenue, Plymouth, 1st, with a most creditable lot of plants; while their arrangement left little to be desired.

TREES AND SHRUBS.

DECIDUOUS MAGNOLIAS.

As this is the planting season, two Magnolias may be pointed out as worth more attention than they usually get. The Yulan, or *M. conspicua*, is one of the finest of the genus; it belongs to the Chinese group, and puts forth its splendid flowers often before winter is past, the bare branches presenting a mass of white. There are several good specimens in the vicinity of London, notably at Syon House, Gunnersbury House, and Kew. This species was introduced into England from the southern provinces of China in 1789 by Sir Joseph Banks. It is planted freely in the Emperor's gardens, and not only used for the enrichment of the landscape, but forced also, so that a perpetual supply of the fragrant flowers is maintained. In China, it grows about 40 feet in height, and in England some very fine specimens are recorded. The Gunnersbury plant before mentioned is a large tree in a sheltered part, where the cold winds and nipping frosts of early spring do not reach it; and to obtain the full beauty of the large waxy white flowers, the tree must be in a sheltered spot. The flowers are useful for cutting; moreover, they are not too strongly scented. It is usually grown as a standard, but is beautiful as a wall plant. The soil should be a deep sandy loam, and occasionally enriched with a top-dressing of manure. When the flowers are over, the leaves appear. *Magnolia Soulangeana* × is similar to the type, except in the flowers, these being more like those of *M. purpurea*, and tinged with purple, whilst they appear later in the season. It was raised in the garden of M. Soulange Bodin, at Fromont, near Paris, and arose through the crossing of a plant of *M. conspicua* with one of *M. purpurea* that stood near to it. The hybrid plainly indicates the parentage. There is a still deeper form of *M. Soulangeana*, named *nigra*, in which the flowers are of a rich shade of purple. *M. speciosa* is probably a variety of *M. Soulangeana*, and it is like that hybrid in growth and leafage. The flowers are similar, but appear later, and they are not so deep in colour. They last over a long season. *M. Norbertiana* is also a variety, with flowers of white and deep purple.

The other deciduous species too little seen is *M. stellata*, or *M. Halleana*, a Japanese Magnolia, introduced by Dr. Hall. It grows about 7 or 8 feet in height, and opens its flowers very early in the spring, before the leaves expand. The petals are white, except in the rose-coloured variety, and narrow. It is sometimes used as a pot-plant for the conservatory, but there is no reason why *M. stellata* should not be planted in the garden, it being very hardy, and only needing a sheltered position to protect it. A small group of it would be pleasing. V.

TRADE NOTICE.

WM. CUTHBERTSON & ROBERT FIFE, sole partners of the firm of Dobbie & Co., inform our readers that on November 11 they assumed as partner Mr. Archibald M. Burnie. Mr. Burnie is a prominent member of the Institute of Bankers in Scotland, and has long been associated with the business of the Clydeadeal Bank, Limited, in Rothesay.

MARKETS.

COVENT GARDEN, November 16.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. ED.]

PRICES rule as last week.

POTATOS.

Arrivals were very heavy, and demand very slow for all kinds, except a few extra good samples, which are readily picked up at high prices. Ordinary samples are a drug. J. B. Thomas.

SEEDS.

LONDON: Nov. 15.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that Clover seeds of all kinds meet at present with but little attention. Cables from America describe a hardening market. Trefoil this season is very dear. Small sowing orders for Winter Tares still come to hand. Rye is steady. As regards Canary seed, quotations in London, and more particularly in Liverpool, continue to rise. The new Hemp seed comes cheap and good. Peas and Haricots show no change. Late advance in Caudian Linseed is well sustained.

FRUITS AND VEGETABLES.

BOROUGH: November 11.—Quotations:—Cabbages, 2s. to 4s.; Savoys, 2s. 6d. to 4s.; Cauliflowers, 5s. to 6s. per tally; Turnips, 1s. to 1s. 6d.; Carrots, 2s. to 3s.; Parsley, 2s. to 2s. 6d. per dozen bunches; Onions, 5s. to 6s. per bag; English, do., 5s. 6d. to 8s. 6d. per cwt.; Apples, 1s. 3d. to 6s. per bushel.

SPITALFIELDS: November 14.—Quotations:—Cabbages, 2s. to 4s.; Savoys, 2s. 6d. to 4s. 3d.; Cauliflowers, 5s. to 6s. per tally; Turnips, 1s. to 1s. 6d.; Carrots, 2s. to 3s.; Parsley, 2s. to 3s. 6d. per dozen bunches; Onions, 5s. to 6s. per bag; do., English, 5s. 6d. to 8s. 6d. per cwt.; Apples, 1s. 3d. to 6s. per bushel.

STRATFORD: Nov. 14.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade has been done as under:—Cabbages, 1s. to 3s. 6d. per tally; Savoys, 2s. to 4s. 6d. per tally; Greens, 6d. to 1s. per bag; ditto, 1s. 3d. to 2s. per dozen bunches; Cauliflowers, 6d. to 1s. 3d. per dozen; do., 2s. 6d. to 6s. per tally; Turnips, 1s. to 1s. 6d. per dozen bunches; do., 30s. to 40s. per ton; Carrots, household, 40s. to 50s. per ton; do., cattle-feeding, 32s. 6d. to 40s. per ton; Parsnips, 6d. to 1s. 3d. per score; Mangels, 2s. to 27s. per ton; Swedes, 20s. to 26s. per ton; Onions, English, 160s. to 180s. per ton; do. Dutch, 6s. to 6s. 6d. per bag; do., American, 6s. 6d. to 7s. per case; Apples, English, 2s. to 5s. per bushel; Brussels-Sprouts, 1s. 3d. to 1s. 6d. per half-sieve; do., 2s. 3d. to 2s. 6d. per flat; Celery, 8d. to 1s. per roll; Horse-radish, 1s. 4d. to 1s. 6d. per bundle.

FARRINGTON: Nov. 16.—Sprouts, 1s. 3d. to 1s. 6d. per bushel; Celery, 8s. to 10s. per dozen; English Onions, £7 to £7 10s. per ton; Apples, cooking, 3s. 6d. to 4s. per bushel; Pears, Catillac, 2s. 6d. per bushel; Tomatoes, English, 6d. per lb.; Grapes, English, 1s. per pound.

POTATOS.

BOROUGH AND SPITALFIELDS: November 14.—Quotations were quoted, 40s. to 110s. per ton.

STRATFORD: Nov. 14.—Quotations:—Magnums, dark-land, 35s. to 42s.; do., light-land, 46s. to 60s.; Bruces, 40s. to 65s.; Hebrons, 60s. to 90s. per ton.

FARRINGTON: Nov. 14.—Quotations:—Bruces, 60s. to 70s.; Main Crop, 70s. to 80s.; Sutton's Abundance, 65s. to 70s.; Magnums, 45s. to 55s. per ton.

LONDON AVERAGES: Nov. 15.—Hebrons, 80s. to 110s.; Regents, 50s. to 70s.; Snowdrops, 60s. to 90s.; Main Crop, 60s. to 80s.; Blackland Magnums, 45s. to 55s.; Magnums, 40s. to 65s. per ton.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the week ending November 11:—Clover, prime, 140s. to 165s.; new, do., 125s. to 145s.; inferior, do., 100s. to 120s.; Hay, best, 145s. to 170s.; inferior, do., 90s. to 100s.; new Mixture, 115s. to 130s.; and Straw, 35s. to 55s. per load.

CORN.

Averages.—Official statement of the average prices of corn, imperial measure (quarter) for the week ending November 11, and for the corresponding period last year:—1893: Wheat, 27s. 4d.; Barley, 29s. 3d.; Oats, 18s. 1d. 1892: Wheat, 28s. 3d.; Barley, 27s. 4d.; Oats, 18s.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

"The temperature was below the mean, the deficit ranging between 2° and 3° in most of the northern districts; but amounting to 5° in 'England, S.W.,' and to 6° in 'Ireland, S.' The absolute maxima were registered either at the beginning or the end of the week; but, with the exception of the 'Channel Islands,' where the thermometer rose to 59°, the highest readings were very little above 50°. In 'Scotland, N.' the thermometer did not exceed 49°. The lowest of the minima were recorded either on November 5, 6, or 7, when sharp frost occurred in all districts excepting the 'Channel Islands.' In the 'Midland Counties' the sheltered thermometer fell as low as 19°, in 'Ireland, N.' to 20°, in 'England, S.W.,' and 'Ireland, S.,' to 22°, and in 'England, E.,' and 'Scotland, W.,' to 23°.

"The rainfall amounted to considerably less than the mean in all districts excepting 'England, N.E.,' where there was a slight excess. In 'Scotland, W.,' 'England, S.W.,' and 'Ireland, N.,' the aggregate for the week amounted to less than half-a-tenth of an inch.

"The bright sunshine was in excess of the mean in all districts excepting 'Scotland, N. and E.,' in 'England, E.,' 'England, S.W.,' and the 'Channel Islands,' the excess was considerable. The percentage of the possible duration varied from 14 in 'Scotland, N. and E.,' to 45 in 'England, E.,' and to 53 in 'England, S.W.'"

B. R. Apples: 1, Northern Greening; 2, Court Penda Plat; 3, Striped Beefog; 4, Landsberger Rennett; 5, King of the Pippins. Pears: 1, Triomphe de Jodoigne; 2 and 4, Josephine de Malines; 3, much too ripe.—A. F. Apple: Brad-dock's Nonpareil.—W. Over. All your specimens are miserably poor. The only one we can name is No. 6, Ribston.—W. R. L. I, Bellissime d'Hiver; 2, Urbaniste; 3, Uvedale's St. Germain; 4, Kerry Pippin, 5, Lady Henniker; 7, Colonel Vaughan.

NAMES OF PLANTS: E. G. Lavatera arborea variegata—J. R. Zygopetalum Mackayi, but not a good form of it. The Oncidium was not found.—Hamburg. Odontoglossum maculatum anceps. The injury to the Cattleya you send, and to others grown in company with it, probably arises from the temperature of the house being kept too high, and at the same time too little moisture and air has been given.—Fern Lover. Laetrea dilatata.—H. W. Wilson. We cannot undertake to name florist's flowers; besides which, the specimen is not sufficiently well-grown to be recognised.—Gardener. 1, Achillea ptarmica flore-pleno; 2, Asperula odorata; 3, a Crassula, not a Cactus; 4, Phalaris arundinacea variegata; 5, Berberis stenophylla; 6, Salix sp.—D. D. Pankhurst. The forked leaf is Ginkgo biloba, the Maidenhair Tree; the other we do not recognise.—Foreman. Abutilon, a florist's variety. Send it to some nurseryman who grows these plants extensively.

PLANTS FOUND IN TURKISH HAY: E. D. Scirpus maritimus, Centaurea aolitalialis, Eryngium creticum.

RATING: W. R., T. The rating is wrong, and you should appeal against it, a glass-house being in the nature of a trade utensil, and the rating on the one-fourth scale. See Purser v. Worthing Local Board, in the Gardeners' Chronicle, March 26, 1887, and the appeal, same case, May 21, 1887.

SHOOTING: A. F. You must obtain a gun licence.

SMALL PLANTS OF CHRYSANTHEMUMS: J. F. These are struck from the tops after the buds have begun to form, or layered from plants in the open. The cutting plan is the better one, as the plants are then dwarfed without pinching, which would make them very late in flowering. They strike readily in a close frame.

TOMATO FUNGUS: N. S. The too well-known Tomato fungus, so often figured and described in our columns. It is too late to do anything but burn the affected specimens now, but you might have kept it in check by the judicious use of the Bordeaux Mixture.

COMMUNICATIONS RECEIVED.—W. Roupell (with thanks.)—Harrison & Sons.—R. Hollister.—W. T. Thomson.—C. L., Erfurt.—H. F.—J. S.—J. H. V.—E. T. R.—L. L., Brussels. J. R.—T. C.—W. L. L.—F. W. S. (the photographs have not come to hand).—Osman & Co.—J. V.—E. P., Ghent.—P. B.—G. P.—Professor Cris, Rennes.—C. W. B.—J. R.—F. V. D.—E. K., Haarlem.—W. W. P.—T. K., Bath.

FRUITS RECEIVED.—Rev. T. W. S.

CHRYSANTHEMUM SHOWS.—Reports have been received from Nottingham—Grimsby—Stroud—Norton, Heckmondwycke, Cork—Ware—St. Neots—Thame—Melksham—Isle of Thanet—Leatherhead—Devizes—Dalston—Wells—Gloucester—Dartmouth—Ealing—Lewes—Tunbridge Wells—Great Yarmouth—Hull and East Riding—Birmingham.

CONTINUED INCREASE in the CIRCULATION of the "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

Increased to the extent of 75 per cent.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

BOUQUET OF WILD FLOWERS: Cotty Ramble. You should learn the names of the various wild flowers of your district. Some flowers fade sooner than others, and do not revive even when put into water; these you should not choose for your posies. In gathering flowers for the house at long distances from home, you should use an airtight tin box, some fresh clean moss, and oiled paper should be taken in the box.

CAMELLIA BLOOMS: S. B. If the trees are large and old, the flowers should be taken off with an inch or two of the shoot attached; but if young, and much pruning therefore unnecessary, the flowers should be removed by cutting them just below the calyx, without any part of the shoot being taken. In both cases the flowers must be "wired."

CORRECTION.—In our report of the National Chrysanthemum Show last week, we were in error when we stated that Mr. Godfrey was 1st for six blooms of seedling Chrysanthemums, staged for special prize, offered by Mr. H. J. Jones. That position was taken by Mr. Rowbottom. Mr. Godfrey won the Society's Silver Medal for six new varieties (Japanese) from any source, and was also 1st for twelve new Japanese.

FRUITS.—Owing to a clerical error of ours, several parcels of fruit sent to this office have passed into the hands of the Royal Horticultural Society, who, we understand, will send the names of the specimens to the senders individually.

INSECTS: X. The beetles in Californian Barley are the common corn weevil, Calandra granaria. R. McL.

MANUAL ON MAKING LAWNS: J. C. Some of the large seed-houses publish directions in their catalogues on this subject.

NAMES OF FRUITS: T. A. D. Your Pear was much over-ripe.—E. Cripps. 1, Duchesse d'Angoulême; 2, Beurré Diel; 3, Hoary Morning; 4, Fearn's Pippin; 5, London Pippin.—J. B. 1, Cox's Pomona; 2, Waltham Abbey Seedling.—Ross. Glou Moreau.—Bowers. Easter Beurré.—A. Bryan. Yellow Belle-d'Or.—A. Weller. Golden Noble.—O. Harvey. 7, Margil; 9, Norfolk Beefing; 2 and 8, King of the Pippins; 4, Lamb Abbey Pearmain; 3, Wyken; 6, Hick's Fancy.—Rev. H. Ellacombe. Apple Wyken.—T. K. Ingram. Large Pear, Beurré Clairgeau; small Pear, Forelle.—

THE PAST WEEK.

The following summary record of the weather for the week ending November 11, is furnished from the Meteorological Office:—

"The weather was mostly fair in the western parts of the United Kingdom, but changeable and showery in the northern, eastern, and south-eastern districts. Snow or sleet was experienced in several of the more northern parts of Great Britain on November 5 and 6; and thunder and lightning occurred at some of our southern and south-western stations on November 6 and 7.

NEW ILLUSTRATED LIST Now Ready.

IMPORTANT.

I RESPECTFULLY beg to inform all readers of this Paper that the first edition (100,000 copies) of my Revised PRICE LIST, consisting of 400 Pages and about 1200 Illustrations, bound in cloth, is Now Ready.

P.S.—Persons who have applied for a List at any time during the year, need not write again, as I have names and addresses, and one shall be sent in due course.

CONTENTS OF SECTIONS.

Table with 2 columns: SECTION and PAGES. Includes sections I-X such as I. CONSERVATORIES, GREENHOUSES, VINIFRIES, ORCHID HOUSES...

WHY CAN W. COOPER SELL HIS GREENHOUSES, &., CHEAPER THAN OTHER MAKERS?

I. Because he imports Timber in large quantities, and with the aid of special constructed machinery converts it into various shapes and sizes required for horticultural work himself on the premises...

AMATEUR GREENHOUSES.

SPAN-ROOF.

Table listing dimensions (Long, Wide, High) and prices for various greenhouse sizes, including 'Delivered and Erected Complete within 20 miles'.

Deduct 10 per cent. if required for brickwork.

THESE GREENHOUSES ARE MADE especially for Amateurs at a nominal figure, thereby coming within the reach of those who require a strong but inexpensive structure...

ILLUSTRATED LIST POST-FREE. GLASS

FREE on RAIL IN LONDON. Packages included. 4ths ... 8s. 6d. 21-oz., 100ft. ... 11s. 6d. The following is a list of sizes always in stock...

HORTICULTURAL TIMBER.

WELL-SEASONED RED and YELLOW DEAL. SASHBARS, 1 1/2 in., 3s.; 2 in., 3s. 9d.; 2 1/2 in., 5s.; 3 in., 6s. 6d. per 100 ft. run. MATCH BOARDS, 1/2 in., 5s. 6d. per square...

TRELLIS, Planed, Extended. 12 ft. by 1 1/2 ft. ... 2 0 12 ft. by 2 ft. ... 3 0 12 ft. by 2 1/2 ft. ... 3 6

"INVINCIBLE" HOT-WATER APPARATUS.

MOST EFFICIENT AND CHEAPEST IN EXISTENCE. Made in six sizes: No. 1, to drive 75ft., £1 15s.; No. 2, 10 ft., £4; No. 3, 200ft., £5 10s.; No. 4, 275ft., £7 10s.; No. 5, 375ft., £8 10s.; No. 6, 500ft., £10; of 6 in. pipes.

Requires no sunk stokehole and no brick setting. Will last all night without attention. Will burn house-cinders, therefore costs next to nothing for fuel. Anyone can fix it. A child can stoke it. Success guaranteed.

MANURES, PEAT, SAND, FERTILIZERS, &c.

1 lb. tins Fertilizer, 4d., 3s. 6d. per doz.; 1 lb. tins Sunshade, 6d., 5s. per doz. Special Offer to Nurserymen and the Trade—144 tins Fertilizer and 144 tins Sunshade, £3 Cocconut Fibre Refuse, 8d. per sack; Silver Sand, coarse or fine (2 cwt.), 2s. 3d. per sack; Best Orchid Peat, 3s. per sack; Best Rhodiendron Peat, 1s. 6d. per sack; Best Brown Fibrous Peat, 1s. 6d. per sack; Best General Peat, 1s. 6d. per sack; Best Loose Peat, 1s. 6d. per sack; Best Surrey Loam, 1s. 6d. per sack; General Potting Compost, 1s. 3d. per sack; Fern Compost, 1s. 3d. per sack; Bulb Compost, 1s. 3d. per sack; Leaf Soil, well decayed, 1s. 6d. per sack; Para Wood Charcoal, 2s. 6d. per sack; Best Peruvian Guano, 6d. per tin; Best Lawn Sand, 6d. per tin; Fertilizer for Farming and Market Gardening (in 2 cwt sacks), 10s. per sack; Worm Destroyer, 6d. per tin; Insecticide, 6d. per tin; Tobacco Paper, 6d. per lb., £1 2s. 6d. per cwt.; Wonderful New Mushroom Spawn, 1s. 6d. per bushel. All sacks and bags free. Send for LIST, post-free.

REAL MANURE.

To make up for the loss from drought, it is absolutely necessary all should use the above immediately. Its effect is marvellous. Just one powerful ingredient makes it far superior to all others.

Mr. NOAH KNELLER, Malshanger Pk., Basingstoke Has had his supply, and says: "The exact dimensions of one Onion, 7 inches across, 19 inches round, weight 2 lb. 9 oz.; twelve Onions weighing 34 lb., which I exhibited at Reading. Grown solely by the use of CANNELL'S REAL MANURE. A farmer said that he wished his Swedes were as big as my Onions."

H. CANNELL & SONS, SWANLEY, KENT.

ALBERT'S HIGHLY CONCENTRATED HORTICULTURAL MANURE.

A Chemically Pure Plant Food. UNPARALLELED FOR ITS RAPID ACTION AND FRUCTIFYING PROPERTIES. BEST and ONLY RELIABLE COMPLETE FERTILISER for all VEGETABLES, FRUIT TREES, VINES, FLOWERS, LAWNS, &c. UNPRECEDENTED RESULTS obtained by its use.

For Prices and Descriptive Pamphlet, apply to—
H. & E. ALBERT,
17, GRACECHURCH STREET, LONDON, E.C.
Responsible Agents wanted.

 ROBERT WARNER & CO., Engineers, 27, Jewin Crescent, E.C.
 Dear Sirs,—It affords me much pleasure to inform you the 25 ft. Annular Sail Windmill, on 40 feet timbers, working a set of 3 in. x 9 in. stroke treble pumps, that you fixed here for Baron Schröder, is giving very great satisfaction, pumping the water through 4,324 feet of pipe, to a vertical height of about 80 feet. I must also express my thorough appreciation of the manner in which the whole of the work has been so successfully carried out.—Yours faithfully,
 H. BALLANTINE, Head Gardener to Baron Schröder.
 We have a similar Mill and set of Pumps in hand for Lord Northbourne.

TO FLORISTS—Wanted position as **SECOND-HAND** in Florists. Two and a half years' thorough experience in all its branches.—**E. R., 129, Leopold Road, Liverpool.**

A MAN'S RUIN, according to an ancient Portuguese proverb may be found in the three following pitfalls, viz. :—To be worth little and presume much; to have little and spend much; and to know little and talk much. Although these defects in any man's character are most objectionable, it is going rather too far to say that they lead to ruin. In these days, when merit is often judged according to the noise it makes, the bombastic presuming man very often comes to the front, whilst his more deserving but timid competitor is thrust aside out of the race. Holloway's Pills and Ointment, however, have outdistanced all rivals in public favour for over half a century.

J. WEEKS AND CO., F.R.H.S., CHELSEA, LONDON, S.W.

CONSERVATORIES DESIGNED and BUILT to SUIT ADJACENT BUILDINGS.

ORCHID HOUSES WITH ALL LATEST IMPROVEMENTS.

PLANT AND FRUIT HOUSES FOR ALL PURPOSES.

All Materials and Workmanship of the Best Quality.

ALL KINDS of BOILERS, our Improved and other Valves, Hot-water Pipes, Castings, Connections, and Fittings, at Lowest Retail Prices.

The Patent "DUPLEX" Upright Tubular Boilers of all Sizes, conditionally GUARANTEED FOR TEN YEARS.

J. WEEKS & CO., F.R.H.S.

Horticultural Builders and Hot-Water Apparatus Manufacturers,

CHELSEA, LONDON, S.W.

CHARLES P. KINNELL & CO.,

IRONFOUNDERS, ENGINEERS, and BOILER-MAKERS.

ROCHFORD HORIZONTAL TUBULAR BOILER,

BOLTING TOGETHER WITH INDIA-RUBBER RING-JOINT, MANUFACTURED WITH FLOW AND RETURN SOCKETS IN ANY POSITION.

This Boiler has special advantages over any other of this type manufacture; the configuration of the centre casting divides the top connecting-pipe into two sections, gives increased waterway, and is removable without taking off back casting. No other Boiler has this advantage.

TERMINAL END AND CHAMBERED SADDLE BOILER.

VERY HIGHLY RECOMMENDED.

This Boiler is of the IMPROVED SADDLE FORM, is manufactured in Wrought Iron, welded; the back waterway, against which full force of the fire strikes, and the centre flue, make this one of the most economical Boilers extant. Made in all sizes, from 24 to 72 in. long.

CAST-IRON SADDLE BOILER,

WITH WATER-WAY END and SIDE-FLUE OPENINGS.

The above is the best of all Boilers of the plain Saddle type. Made in all sizes, from 24 to 66 inches long.

Holding one of the largest stocks of H. W. Boilers, Pipes, and Fittings, in the Kingdom, we are able to execute Orders of any magnitude from London Warehouses, or to despatch direct from Works without delay. To meet the requirements of our increasing business, we have recently added No. 65, Southwark Street to our London premises, and have now the largest and finest Show-rooms in our Trade in the Kingdom. Price List illustrating all types of Boilers, Valves, Pipes, Ventilating Gear, and all classes of Horticultural Appliances, free on application.

65 and 65a, SOUTHWARK STREET, LONDON, S.E.; also Branches at GUERNSEY and JERSEY, for CHANNEL ISLANDS.

SILVER MEDAL HORSE-SHOE BOILER,

The Best and Most Economical Amateurs' Boiler Manufactured.

Section of Boiler and Pipes, showing action of Hot Blast and Automatic Regulator. Awarded the SILVER MEDAL (FIRST PRIZE) by the Royal Horticultural Society in 1883; still stands without rival for—

Power, Efficiency, and Economy.

Patents 10,398.

Friday Next.

New and Magnificent

CYPRIPEDIUM CHARLESWORTHII
(ROLFE, n. sp.)

Exhibited and unanimously awarded a First-class Certificate by the Orchid Committee of the Royal Horticultural Society, and pronounced by every one to be the most beautiful and charming Cypripedium introduced, causing quite a sensation at the Drill Hall on Tuesday, September 25, 1893.

The special feature of this novelty is the dorsal sepal, which is quite distinct in appearance and colour to any other known Cypripedium, which will render it exceptionally valuable to the hybridist.

We have been at an enormous expense in searching a country which is void of every trace of civilisation, and are pleased to say our efforts have been rewarded by the good fortune which befell our collector in discovering this new plant which has been pronounced on all sides as the finest Cypripedium of its section. The plants were carried on the backs of the natives for 140 miles, under most trying circumstances, over a most wretched road. Nevertheless, we are pleased to inform intending purchasers that in consequence of the care taken the plants are in excellent condition, and embrace specimens which our collector says can never be imported again, as he gathered all the plants fit to take; to use his own words, "He left nothing but scraps."

We anticipate some wonderful varieties will crop up amongst the plants, which look very distinct indeed, the foliage of some of them being spotted up to the extreme tips of leaves, others being quite plain, with slight blotch of reddish-purple at base of the growth. The collector writes that he saw a few flowers which measured $4\frac{1}{2}$ to 5 inches from tip of dorsal sepal to extremity of pouch.

MESSRS. PROTHEROE AND MORRIS have received instructions from Messrs. Charlesworth, Shuttleworth & Co., Heaton, Bradford, to offer the above great novelty, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, December 1, at half-past 12 o'clock.

On view morning of Sale and Catalogues had.

TO SEEDSMEN.—To be DISPOSED OF, in consequence of the death of the proprietor, an old-established FARM and GARDEN SEED BUSINESS, with a wide connection in a good Market Town in the Midlands, and on Two Railways. This is a rare chance for a desirable purchaser that does not often occur.—Apply to SEEDSMAN, Messrs. Hurst & Son, 152, Houndsditch, London, E.

FOR SALE.—In a good Agricultural district in Oxfordshire. A good SEED, CORN, HAY, &c., business. Only shop of its kind in the town. For particulars apply, S. T. O., Messrs. Hurst & Son, 152, Houndsditch, E.C.

HIGHLY IMPORTANT SALE OF PLANTS.

MESSRS. RENDELL AND SYMONS are favoured with instructions from A. M. Stoger, Esq., to **SELL** by AUCTION, on FRIDAY, December 1, 1893, the whole of the valuable collection of STOVE and GREENHOUSE PLANTS, contained in Conservatory, Fernery, Plant, Melon, Tomato, Cucumber, Peach and Intermediate-houses, Vinery, &c., consisting of group of splendid Palms, variety of choice Ferns, Orchids, Rare Specimen Plants, Primulas, Freesias, Vallotas, Begonias, Abutilons, Rondeletias, Coleus, Panax, Crotons, Vincas, Marantas, Camellias, Geraniums, Arum Lilies, Cinerarias, Cactus, Hoya, Pelargoniums, Gloxias, Achimenes, Caladiums, Solanums, Genistas, Azalias, Spireas, Carnations, Hydrangeas, Chrysanthemums, Deutzias, Fuchsias, and 320 Potted Strawberry Plants for Forcing, in all about 1700 Plants.

The Palms are a grand show, stately in growth and well-leaved; amongst the Ferns especial mention must be made of the large Adiantum Farleyense, those being rare and costly specimens. The whole of the remainder should command the attention of Horticulturists, great care and judgment having been displayed throughout the collection.

Catalogues, 3d. each, can be obtained of the Auctioneers, on and after November 24. On view day previous to Sale, from 10 A.M. to 3 P.M., and on morning of Sale after 9 A.M.

Sale to commence at 11 A.M.

Dated, Nov. 21, 1893.

 The Nurseries, Milton, Stoke-on-Trent.

NEW BORDER CARNATIONS.

MADAME DE FALBE.—Clear yellow, full flower, and perfect pod; stands well in the open border, the flowers remaining in good condition during weather that quite destroys the beauty of Germania. I was awarded 2nd Prize in Mr. Martin Smith's competition, at the National Show, Chiswick, although, owing to the very early season, the finest flowers had all been cut.

SOLENT QUEEN.—A seedling from Mrs. Reynolds Hole, possessing all the good qualities of that variety, with a perfect pod; colour deep yellow, flaked and striped with bright rose. This variety, unnamed, was in my 1st Prize Collection, at Earl's Court, 1892.

Very strong plants, 1s. 3d. each; 12s. per doz. Post-free, cash. **CARNATION CATALOGUE** on application.
EDWARD C. GOBLE, F.R.H.S., M.N.C.S., Walcot Nursery, Ryde, Isle of Wight.

WORTH WAITING FOR.

My New Descriptive and Illustrated

CHRYSANTHEMUM CATALOGUE

IS NOW IN PREPARATION.

This will be the most useful and complete ever published, and will contain **CULTURAL ARTICLES** by Mr. C. E. SHEA and H. SHOESMITH. Also Names and Description of some of the **FINEST NEW AMERICAN SEEDLINGS** that have recently passed into my hands for distribution in this country; these consist of the pick of 35,000 Seedlings raised in the States last year, and they are unique in size, style, and colour, and will be necessary to every Exhibitor.

In addition, there will be **SELECT LISTS** of FINE NEW **HARDY VARIETIES** of greatly improved form; also of English-raised and Continental varieties; as well as much other matter interesting to every Grower of the Chrysanthemum. This will be ready shortly, post-free for 7 Stamps.

H. J. JONES,
 Ryecroft Nursery, Hither Green, Lewisham, S.E.

W. SHAND, Nurseryman, LANCASTER.

NEW CHRYSANTHEMUMS.

We have great pleasure in announcing that we have acquired from Mr. T. H. Spaulding, New Jersey, U.S.A., the sole right of distributing his new set for 1894 in Europe. The plants arrived too late to produce exhibition blooms this season, and we were therefore unable to show them for Certificates, but the flowers we have had are wonderfully promising and fully bear out the raiser's descriptions. Mr. Spaulding tells us that this is the finest set he has ever sent out, which, coupled with his position as the first raiser in the States, will be ample proof of the value of these novelties. We have a good stock in hand, and shall therefore be able to supply strong healthy plants struck cool, which will bear full-sized blooms the first season. Catalogue containing these and the cream of all the other novelties, ready in a few days, free on application.

J. R. PEARSON & SONS,
CHILWELL NURSERIES, NOTTS.

THE

Gardeners' Chronicle.

SATURDAY, NOVEMBER 25, 1893.

CANNAS.*

I FIRST recollect Cannas as one of the most important series of plants which, so skilfully used by the late Mr. Gibson in Battersea Park, led to the making of a sub-tropical garden in every place of size and gardening importance; but it was for their foliage alone they were valued, and we all recollect the noble beds of reddish foliage of the Warscewiczii and nigricans race, and the fine beds of such green-leaved sorts as Annei and limbata, still found in the Paris gardens [Especially at the Park Moncean. ED.]. But when M. Crozy, of Lyons, introduced a series of Cannas with showy finely-formed flowers, the plants began to be again inquired for, and anyone who, like myself, saw the fine beds which he planted out in the last great Paris Exhibition, 1890, was quickly won by the beauty of the new race. They were most effective, and seemingly of easy culture in the open air. Plants of vigorous 6 to 7-feet growth of fine leaves, topped with showy flowers, very varied in colour, and perpetual in habit of flowering, were, indeed, a striking novelty. The flowers were yet somewhat ragged, as one looks back to the varieties which were the novelties of that year; but they were some of the kinds which we still think good: Henri Vilmorin, not yet beaten in its colour; Petite Jeanne, the first dwarf gold; Victor Hugo, one of the good kinds, brilliant red, with dark foliage; The Garden, the first vermilion-red; President Hardy, salmon-fawn; Comte de Choiseuil, amongst crimson, were amongst them, and from that date until now, the indefatigable French raiser has gone on, year by year, giving us plants of dwarfer freer habit, finer individual flowers, each year with broader petals, of thicker texture, and finer spikes, till we have in this season's novelties varieties such as Sophie Buchner, L. E. Bailey, and Alphonse Bouvier, bearing flowers almost equal to Gladioli.

In a very brief note (for my request for information gave M. Crozy barely time to catch the post) he says:—"My *début* in the race of Cannas dates from about twenty years ago. I began with Warscewiczii and nepalensis grandiflora, a tall variety of which I have reduced its height little by little. My first gain was C. Bonnetti, a variety much appreciated at the time; since that period, constantly progressing, I succeeded in obtaining the splendid variety Madame Crozy, which by the year I had it ready to put into commerce, had given me 1500 seedlings. These flowering have given me all shades of colour, and since then I have improved in the rose and carmines, even attaining nearly to whites." So far M. Crozy; a good brief record of sound floricultural work.

* Paper read before the Horticultural Club, November 14 by George Paul, Cheshunt.

M. Vilmorin has also done some work in this way successfully, as two certificated varieties grown at Chiswick show, one, Quasimodo, is in most lists. Herr Pfitzer, amongst Germans, has laboured in the same lines. I have attempted some hybridising, but though satisfied with the dwarfer habit and fine flower in the yellows, I do not think that I or other raisers have yet rivalled Crozy's gains. In a quantity of seedlings, the proportion of good seedlings is small, the majority reverting to older types. I think seven or eight were all I selected from 400 or 500 which flowered when planted out this season.

Their outdoor culture is simple. Prepare the ground as for Dahlias, plant young-growing plants, if on a lawn, in massive beds, about 3 feet apart, in rich soil, and beyond some watering to establish the plants, and a possible mulching if the weather is dry, nothing more is needed. The earlier they are put out the better, so long as it is past the time of the May frosts. They soon flower, and keep on until they are either cut down like the Dahlias (when they should be taken up and stored in a similar manner), or, what is better still, they can be utilised for winter flowering. This season I made a good experiment. Lifting out of a bed of seedlings all the plants with showing spikes, they rose with good balls, and were placed in a light house on a stage near the glass, the balls covered with cocoanut fibre. With a gentle warmth all the finest flower-buds expanded, giving very useful spikes of flowers; or taken up, they may be at once split into young plants, after a short period of rest be grown on in a temperature fairly moist, of say 60° to 65° by day, and the young plants soon throw up continuously one or more spikes of useful winter flowers. Last year I had a fine batch in January, and these plants continued flowering throughout the year, giving something like five or six crops, in fact we were never without Canna flower-spikes. I think for pots the keynote of culture is alternating the periods of growth and rest.

The constantly potting of the plants into larger pots, say three times a year, until they become specimens too clumsy to handle, should be deprecated, but, if kept in the same pots, they should be heavily mulched and fed highly. Perhaps masses of roots congested in pots may tend to freer flowering, but the spikes are not so fine. Soil should be sandy loam and rotted manure; they take much water like most large leaved plants, but need good drainage. Up to the present the best-named varieties are amongst crimson, Alphonse Bouvier; Sophie Buchner, Paul Bruant, purple; Miss Sarah Hill, rich crimson; C. H. de Choisenil, rosy-crimson; and the fine old Victor Hugo, with its crimson foliage. There are some good salmon-reds, varying to vermilion, in President Hardy, Professor David, Cronstadt, Souvenir d'Asa Gray, Thos. S. Ware, and The Garden. Some quaint mixtures of crimsons and yellows in Henri L. Vilmorin and Count de Ganay. The best-margined flowers are Paul Sigrist, Marquise d'Aigle, and Admiral Gervais, and last, but not least, Madame Crozy.

But the greatest advance, in my opinion, is in the gains of the last two years in the new yellow-spotted varieties. The first of the series was in 1892, when Comtesse d'Estoire, a beautiful delicate flower with yellow base and carmine spots. This was followed by the beautiful golden variety with crimson spots, Progression. Antoine Barton, soft yellow spots, the yellow counterpart of Madame Crozy and F. L. Bailey, a lemon with beautiful carmine spots.

I do not know what further lines the Canna may take. In his lecture on Cannas, Mr. Baker pointed out two or more species which might profitably be used in the way of hybridisation. I may point out that the drooping form of the variety of Iridiflora, such as Ehmanni, may be of service, and a white variety C. nevalis, may further the march towards pure whites, a desirable attainment. On the whole, we have gained a new series of flowers with hardy character for outdoor summer decoration, and for easy winter and summer indoor culture.

A few notes as to raising seedlings. I find they should be sown in February on bottom-heat, the seeds just laid down on the stage bottom, and with a slight covering of cocoa-nut fibre. When they have started, they should be potted in small pots, and as soon as these are filled with roots, re-potted in 48's, then be hardened-off in a cold frame ready for planting in May. In dividing, please note that the old roots do not seem to send out fresh fibres; but young roots are thrown out from the base of the crowns. A few hot seasons like the past will make these plants more popular as out-door plants, and I venture to think their popularity as pot-plants will also quickly increase. *George Paul.*

NEW OR NOTEWORTHY PLANTS.

CYPRIPEDIUM × LEEANUM, YOUNG'S VAR., *new var.*

This is equal in size to the beautiful C. × L. giganteum, but of a much darker colour, and it seems to be the largest of the dark-tinted forms of this very variable plant. The upper sepal is nearly 3 inches wide, its lower half of an uniform bright green colour, and from the base dark dotted lines ascend, which appear of a chocolate colour on the green ground, but purple where they are more thinly scattered on the broad white margin. The petals are broader, and the pouch larger than in other varieties, and the whole flower bears evidence that very fine forms of C. Spicerianum and C. insigne must have been used in its production. It was flowered by Reginald Young, Esq., Fringilla, Sefton Park, Liverpool.

LILIO-CATTLEYA × BRYMERIANA (L. C. × AMANDA × C. WARSEWICZII).

For the second time flowers of this fine hybrid between what are called in gardens *Lelia Rothschildiana* and *Cattleya gigas*, are sent by W. E. Brymer, Esq., M.P., Ilington House, near Dorchester, whose gardener is Mr. J. Powell. The plant is said to be intermediate between the varieties crossed, and the same may be said of the flowers, which in the first specimen sent, measured more than 6 inches across; but the two now to hand are not quite so large. The petals and sepals are of a pale lilac hue; the base of the labellum is of a rose colour, which deepens towards the tips of the side-lobes to rose-crimson. The same rich hue prevails over the greater part of the surface of the beautifully-crimped front-lobe, but it gradually becomes of a lighter tint towards the edge. There are white and yellow lines at the base of the lip. It is a very fine plant, and evidently very floriferous.

CYPRIPEDIUM CROSSIANUM × CASTLE HILL VAR. (CROSSIANUM × INSIGNE CHANTINII).

Although in this case C. × Crossianum (insigne × venustum) has been again crossed with a form of C. insigne, I see nothing in it which would serve to sufficiently distinguish it or to cause its removal from the variety named, which in itself affords numerous variations. The result of again crossing with C. insigne Chantinii has been to produce a very brightly-coloured flower, in which the ground colour is yellower than in other forms. There is also present in the progeny of this cross a broad pure

white margin, with some bright purple spots on the upper sepal. The whole flower has a polished surface, and the markings are clearly defined. It was raised and flowered in the gardens of G. O. C. Raphael, Esq., Castle Hill, Englefield Green. *James O'Brien.*

COMMERSON'S MONUMENT IN MAURITIUS.

The following letter has been received from the Superintendent of the Royal Botanic Gardens in Mauritius, which may probably interest those of your readers who noticed the account given of Philibert Commerson in the pages of the *Gardeners' Chronicle* some little time since. *S. Pasfield Oliver, Captain.*

"Royal Gardens, Pamplemousses, Sept. 23, 1893.

"I received yours by last mail and would have answered you at once, but at the time could not do so. I read with much pleasure your articles on Commerson in the *Gardeners' Chronicle*, and will do anything I possibly can to assist you in any way whatsoever. I am sorry to say that we do not possess a single plant of Polycardia in the gardens, and I shall be delighted if you would write to your friends in Madagascar and move them in the matter. I will make everything right when they arrive here.

"I cannot find out where Commerson is buried, but when passing I always stop to look at the monument at 'La Retraite.' I intend to photograph it next time I go that way, and shall send you a copy.

"Your suggestion quite falls in with my ideas, and I shall get some Bougainvilleas planted near to the monument, together with some of our Mauritius Palms, particularly *Latania Commersonii*.

"I am glad you have taken up this subject, for it has struck me that a great deal of noble work can be done in keeping green the memory of those early toilers, whose names are in many cases looked upon as a reference only. It may seem strange, but I have never met anyone here who can tell me anything about Commerson; they have heard of the name, and that is all. Trusting to hear from you soon again. *William Scott.*"

ORCHID NOTES AND GLEANINGS.

PICKERING LODGE, TIMPERLEY, CHESHIRE.

The *Cattleyas* of this garden, at the present time in fine bloom, form an interesting floral feature, there being 190 large flowers expanded of the following species and varieties: *C. labiata vera*, an example 3½ feet in diameter, with seventy remarkable flowers; a plant of *C. labiata*, in a 9 inch pot, and carrying six fine spikes of large flowers of a rich shade of colour; two plants of *C. aurea*, with four flowers; a plant of *C. Massiana* is very fine—this is a supposed cross between *C. aurea* and *C. Sanderiana*; *C. Bowringiana* has four spikes averaging fifteen flowers each, another with eighty flowers, and one with sixty flowers—one spike of this plant bearing sixteen flowers. In a span-shaped house, 20 feet long, with stages of 3 feet in width on either side, there are two groups of *C. labiata*, every plant in perfect health, sturdy in growth, and the number of fully-expanded flowers about 600, of the greatest beauty and diversified shades of colour. Mr. Hardy and his gardener may be justly proud of such fine plants as the above. *H. Ellis.*

PHALENOPSIS GRANDIFLORA.

We have a plant of the above species now carrying forty fully-expanded flowers, each flower measuring over 3 inches in diameter. There are yet other blooms to open on the same spike, and yet another strong later spike which has not yet commenced opening its flowers [a very unusual number of blooms. Ed.] There are other plants of the same species, with flowers measuring over 3½ inches, with from eight to twelve blooms on each. *P. Schilleriana*, the first to flower, which generally commences to open early in the new year, and of which we

always have a grand display until well into April, is, as usual, throwing up finely and strongly, and from one plant, which has thrown two flower-spikes, each spike bears a young plant, which I have mossed round, and when rooted it will be cut off, and grown on in the usual way. *G. W. E., Henham.*

pretty rosy-crimson flowers are disposed. The lips display great variation, some having the centre white, and with a purple blotch. Others have little white, but various shades of rose colour. Such an elegant display of flowers in the dull season is a good reward for the care taken of the plants.

several horticultural societies in that country. It is probable, therefore, that its history is known there. At present, there is some doubt that the plant is a hybrid, partly from the fact that it comes true from seeds—the Kew plants were raised from seeds received from Melbourne in 1889—and also that it

FIG. 104.—TECOMA SMITHII: GREENHOUSE SHRUB; FLOWERS WITH ORANGE-COLOURED TUBE AND YELLOW SEGMENTS.

(Shown at a meeting of the Royal Horticultural Society on October 10, 1893.)

BARKERIA LINDLEYANA (EPIDENDRUM LINDLEYANUM).

Nine plants of this fine species are in flower in the collection belonging to F. Wigan, Esq., at Clare Lawn, East Sheen, Richmond, where Mr. W. H. Young, the Orchid grower at Clare Lawn, manages the *Barkerias* well, although many consider them very difficult to grow. The plants are in fine health, and bear spikes about 18 inches long, on which the

TECOMA SMITHII.

It is desirable that something more definite should be known of the origin and history of this beautiful plant than has been recorded up to the present. We are told that it was raised in Australia from *T. capensis* crossed with *T. velutina*, the latter a variety of *T. stans*, and that it has been certificated by

looks suspiciously like a form of *T. stans*. This species varies considerably, some of the varieties being large and handsome in flower and shrubby in habit, whilst others are scandent and less attractive. *T. velutina*, one of the supposed parents of *T. Smithii*, is itself a beautiful plant, which was introduced from Guatemala by Skinner about fifty years ago, who sent seeds of it to the Royal Horticultural Society,

from whence it was distributed in hundreds. Skinner described it as one of the finest plants in Guatemala, flowering freely during a large part of the year, with Ash-like leaves and great terminal racemes of magnificent yellow flowers, in no respect inferior to an Allamanda! It is remarkable that this plant, which is said to have flowered freely in this country in nine months from seeds, was never figured in any English periodical; and, as far as I can make out, it did not remain long in cultivation here. The only record I can find of it is in the *Gardeners' Chronicle*, 1855, p. 820. Is it in cultivation now? Apparently, it has found its way into Australia, and, if so, English horticulturists would like to receive it back. *T. Smithii* might also be taken for a robust form of *T. fulva*, figured in *Bot. Mag.*, t. 4896. This, *T. stans*, and *T. mollis* are very near each other. *W. W.*

ORCHID CULTURE IN BELGIUM AND IN ENGLAND.

THE letter which Mr. Watson, the well-known assistant-curator at the Royal Gardens, Kew, contributed to a recent number of the *Gardeners' Chronicle*, seems to convey the idea that in commenting upon certain methods of Orchid culture pursued in England, and which seem to me less well understood in that country than in Belgium, I have not rated the English gardeners at their right value. It was before the publication of Mr. Watson's letter, which appeared in your issue of the 11th of this month, that I published in my *Journal des Orchidées* on November 1, the following commendation of his compatriots and his country:—"There are in England a great number of excellent gardeners. A visit to any horticultural exhibition shows that, for there may be seen unrivalled specimens of all classes of plants. Personally, I admire England with its scientific institutions, which are the first in the world, both as regards the progress in science and their excellent organisation; for instance, the gardens at Kew and their cultural achievements, their eminent botanists and wonderful herbarium. I admire the English horticultural press, so generally useful, so progressive; also the unrivalled private collections and fine horticultural establishments of this great and noble country." I should not like any one to attribute to me in England, where I have many friends, or elsewhere, any opinion which I do not really hold, and I am no "Chauviniste."

I must further remark that I am only alluding to Orchids in the article to which Mr. Watson alludes, the English are so superior in other branches of horticulture that they may well yield to us in this. Mr. Watson makes a very true remark concerning the special modes of cultivation peculiar to the respective countries. But then he writes:—"Certainly the Orchids generally in M. Linden's establishment are splendidly grown. I have never seen such fine collections of *Odontoglossums*, *Masdevallias*, *Vandas*, and *Cattleyas* anywhere." If he believes that these results are due to the fact that our ground is situated between the Luxembourg station and the Parc Léopold, I think he is making a little mistake. I know him to be too skilful and experienced not to have noticed that if our cultivation of Orchids is so good it is because we endeavour to give our plants an artificial climate like that of the regions whence they come. If our *Odontoglossums* and *Masdevallias* surprise our visitors so much, it is because in the houses which are assigned to them by us they have as much air, light, coolness, and moisture, as on the high Cordilleras. These methods are pursued in accordance with the instructions of M. J. Linden, my father, who brought back from his long exploratory travels accurate observations. We have simulated the climate of the Cordilleras as closely as possible, only the mountains are lacking. This is the reason why no collector returning from Columbia but exclaims on entering our alpine plant-houses, that he could believe himself again among the Columbian mountains. This M. Claes and Bungeoth told me two months ago, and so M. Edouard Klaboch, who has just travelled for us, said to me a week ago. I do not experience

the same feeling in the *Odontoglossum*-houses which I have visited near London, and according to my habit of saying and writing what I think frankly, I have said so in my *Journal des Orchidées*, believing that it would be useful to such of my English friends who ask me when they visit our houses:—"But how do you grow Orchids so well? Do you use manure?" This last question was put to me by Mr. Watson himself recently, and I assured him, as I have stated many times, that we use no manure, as could easily be proved by analysing the compost. An artificial mountain climate, good and sweet potting materials, rain-water invariably used for watering, and constant attention; such are our secrets as regards the culture of *Odontoglossums* and *Masdevallias*. It is plain to me that if this same treatment were adopted in England—that is to say, that if to Orchids from the high Cordilleras were given such a climate as that to which they are by nature accustomed—success in cultivating *Odontoglossums* and *Masdevallias* would be as complete as with us. I have said that the method of cultivating them with excessive heat, insufficient ventilation, light and moisture, and on stages covered with coke, which intercept the circulation of the air, is prejudicial to plants; I repeat, that I believe these to be important matters. If the *Gardeners' Chronicle* would give me space, I would willingly contribute to it notes on our plan of cultivating *Odontoglossum*, *Masdevallia*, *Vanda*, *Cattleya*, and other species.

I could show, perhaps, in these articles that the difference in the climate of England and Belgium is of little importance as regards plant-growing under glass, and that it is always possible to artificially modify these climates, so as to equalise them one with another. Far be it from me to think to thrust my plans on English growers. It is even very probable that in England one might grow *Odontoglossums* otherwise than is done in Belgium; but as I consider certain Orchids less well treated in England than here, I must say that the system of cultivation is badly arranged, that it is wanting in certain points, and that these defects should be supplied. I claim that our climate goes for nothing in the end, the proof of which is, that as Mr. Watson himself says, there are many places in Belgium, even among our own neighbours, where cultivation is far from perfect. These persons have not yet found the "something" wanting. As to blooming, it follows necessarily that this must be fine where the vegetation is good and the pseudo-bulbs large and firm. Our visitors are always surprised at the size and thickness of the flower-stems of our *Odontoglossums*, and at the profuse blooming of most of our Orchids. Further, as I could explain in my articles, preparation for the blooming is given great importance in our system of cultivation.

Before concluding this rather long note, allow me to reciprocate Mr. Watson's compliments as paid to our establishment by saying, that on my last visit to England two months ago, I was struck with the cultural achievements in the Royal Gardens, Kew; and let me offer my hearty congratulations to the Director and Curators, as well as the managers of the collections of Baron Schroder, Mr. Measures, and Sir Trevor Lawrence—the only large amateurs' collections I had time to visit—who will receive them as coming from a cosmopolitan observer, who can appreciate fine plants wherever found, and is convinced that the word "nationality" has no importance in horticulture; that there are skilled and unskilled men everywhere, that birth-place goes for little in a man's character, and should influence (*passionner*) no one. *Lucien Linden, Brussels, Nov. 14, 1893.*

— Since I read the views of M. Lucien Linden on Belgian or French methods and men, as compared with British methods and men, I have been expecting to see the gauntlet taken up, and I was not at all surprised at Mr. W. Watson's sturdy expression of his opinion on the subject on p. 596 of *Gardeners' Chronicle*, Nov. 11, of this year. The whole thing seems to me a question of brains, plus a good climate, i.e., a good climate for the cultivator, if possible, as well as for the plants he grows. In the main, Mr. Watson is undoubtedly right when he says that

English methods, even of the best, would fail to yield the same results in France or Belgium, and *vice versa*. This is self evident, seeing that the conditions are so different in each case. But as I said, it is mainly a question of the most logical head, and the most healthy or energetic body, both specially well-trained, by which I mean that the really well-educated gardener soon adapts his principles and methods to any and all conditions, native or otherwise. Hence, no doubt the demand for English, Scotch and Irish, or Welsh gardeners and tea-planters, and foresters, and Cinchona growers in India, Ceylon, and elsewhere. This also means broadly, that the European gardener is the best in Asia, Africa, and America, educated brains and hardy bodies being best even under adverse conditions for both. I say this, although I do not forget the skill of the Chinese gardeners everywhere, and especially that of the Japanese in their own country.

To consider the question as to whether English, Irish, Scotch, or Belgian gardeners are best, would lead to no practical or good results whatever. But as Mr. Watson praises the English as cultivators, for their adaptability, "of course including the Scotch," as cultivators, may I venture to ask why he did not include the Irish as well?

"Paddy" is insolated, and a little behind the times, perhaps, for that very reason, but at cultural "adaptability" he can give points to any nationality on earth, and beat them at their own game. Search where you like, remembering that the whole population of Ireland itself does not equal that of London, and where can you find so much ability? Has London given us greater names than Wellington of yesterday, and Wolsey of to-day? In the church, at the bar, in the medical profession, and in the house of Commons, not only in England, but also in greater Britain, in America and the Colonies, you find the Irishman in the first positions. It is the same to a great extent in our own craft, in which many Irishmen particularly excel, even in London, where the names of Casey, O'Brien, and many others are not unknown. In America there are a still larger proportion of Celtic gardeners, many of them in the front rank as nurserymen and cultivators. *F. W. B.*

KEW NOTES.

SONERILA MACULATA.—This is the correct name for the plant introduced by Mr. Bull three years ago, and distributed by him under the name of *S. orientalis*, varieties. The purple-leaved variety is now flowering profusely in the stoves at Kew, and is an ornamental little pot-plant of about 9 inches high, and crowded with purple leaves and numerous erect little bunches of pink flowers. *S. maculata* is a native of Assam, the Khasia mountains, and Tenasserim. Although a common plant, and well known to botanists, it does not appear to have been introduced into cultivation before Mr. Bull obtained it. The well-known *S. margaritacea* is supposed to be a native of Sikkim, but it has not been recorded wild. It was introduced in 1854 by Messrs. Veitch & Sons. There are now numerous named varieties of it, all of garden origin, the best of them being Hendersoni, argentea, and Mamei. *S. elegans* and *S. speciosa* are other handsome little flowering pot-plants which have been introduced.

Freylinia cestroides.—Flowering specimens of this interesting Cape shrub have lately been sent to Kew by a correspondent in Caanes, who says it forms a handsome bush there, and flowers freely in November. It has erect branches, clothed with opposite linear lanceolate green leaves five inches long, the flowers being borne in crowded, erect, terminal panicles; they are cream-yellow coloured, and are tabular in size and form, suggesting *Cestrum* or some species of *Buddleia*. It looks like a plant that requires a maximum amount of sunshine and summer heat to make it flower freely. *Freylinia* is a small genus of Scrophulariaceae, and is related to *Phygelia* and *Ixianthes*. Other names for *F. cestroides* are *Buddleia glaberrima*, *Capraria lanceolata*, and *C. salicifolia*.

Freylinia longiflora, a second species, with Box-like foliage, and crowded panicles of white flowers an inch long, is a plant worth introducing from the Cape.

Rosa gigantea.—This extraordinary Rose grows at an amazing rate, the plant in the Temperate-house at Kew having shoots 1 inch in diameter, but as yet it shows no signs of flowers. Age is probably all that is needed to induce the plant to flower. Meanwhile, our appetites may be whetted by the following note from a correspondent who lives near the home of the Rose in Burma. He writes:—“*Rosa gigantea* grows in profusion immediately opposite the window I am now writing at, and for 100 yards or more away. The stems of some of the plants are as thick as a man's thigh. It is a creeper, and does not flower until it gets over or beyond the tree it climbs. These specimens are on large evergreen trees, and their roots are in limestone and vegetable mould, through which run innumerable springs of pure water. The boles of the Roses never get the sun, and they are always in the neighbourhood of spring water, which some of their roots no doubt find. The whole southern and western aspect of this group of large trees is covered up to 50 or 80 feet in height with Rose sprays, and when in full bloom it looks like a sheet of white, and the air all round is most beautifully scented. It is certainly a glorious sight. The ground is strewn with the seeds of the Rose in July.”

Selaginella Pitcheriana.—The plants sold under this name at the recent sale of the collection of plants at Messrs. Pitcher & Manda's Nursery, Swanley, are *S. erythropus* var. *minor*, a fairly well-known plant in English collections.

Phytolacca abyssinica.—Specimens of the *Jaborandi*, *Pilocarpus pennatifolius*, have lately been received at Kew under the above name. This plant is the source of a valuable drug known as *Pilocarpine*, and is a native of Brazil. It has been in cultivation many years at Kew, and a figure of it was published in *Bot. Mag.*, t. 7235. The inflorescence is a simple spike 18 inches or 2 feet long, clothed from base to apex with small star-shaped purple flowers with yellow anthers. It thrives in a greenhouse temperature. *W. W.*

COLLECTING IN SOUTH ARABIA.

We learn that Kew has made arrangements for a young gardener, Mr. W. Lunt, to accompany Mr. Theodore Bent's expedition to South Arabia as collector of plants and specimens for the gardens. There are good reasons for believing that the flora of that part of Arabia to be visited is exceptionally interesting, both botanically and horticulturally, and we are therefore glad that Kew has seized the opportunity to send a collector. In our opinion, it would be worth while to send plant collectors with all expeditions into countries where the flora is unknown or interesting. There are many horticulturists who take an interest in other plants beside Orchids, but comparatively little is done in the way of introducing new plants except Orchids. The following is an account of the Arabian expedition given by Mr. Bent to a representative of Reuter's Agency:—

“The objective point of my new expedition is the Hadramaut, the ancient frankincense country, and one of the four ancient kingdoms of Southern Arabia which formerly supplied the world with its more important luxuries. A botanist from Kew will accompany us, and we shall be met at Alexandria by an Arab zoological collector, and at Aden by an Indian surveyor. Our expedition will thus number five persons, but this will, of course, not include interpreters and a native escort, which will be provided by the Sheikh of Makulla, whose influence extends over the whole field of our proposed operations.”

“Speaking of the country to be explored, Mr. Bent said:—

“It is practically unknown, the only European who has visited it being a German traveller, who went there early in the thirties, and who gave but scanty information. The district to be explored lies

about 300 miles up the coast from Aden, and consists of a narrow strip between the sea and the desert, the area of which is absolutely unknown. It is, however, reported to be rich in ruins and inscriptions of the old Hadramaut kings. On arriving at Aden, my expedition will proceed up the coast to Makulla, a distance of 300 miles, and thence in all probability camel riding will be our mode of travelling. After leaving Makulla, our movements will be guided by what the Sheikh tells us we can do. We expect, however, to complete our work by about April, when we hope to return to England. I decided to explore this district in continuation of my work previously done in Abyssinia and in Mashonaland, and to obtain further evidence as to the early wealth and power of the southern Arabian kingdoms. The expedition has received support from the Royal Geographical Society, the British Association, and the Royal Society.

“I have every confidence,” said Mr. Bent, in conclusion, “that the expedition will have important results, not only from an archaeological, but from other scientific points of view.”

EXPERIMENTS IN CHECKING POTATO DISEASE.

The experiments on the use of Bordeaux Mixture as a remedy against Potato disease, which were conducted in the United Kingdom and abroad in 1891, formed the subject of a special report which the Board of Agriculture laid before Parliament in 1892. Further experiments of the same class have now been prepared in continuation of the information then given.

Although the Potato disease was not prevalent to any considerable extent in Europe in 1892, except in some districts in Ireland, it was present in England and some parts of the Continent in a sufficient degree for the purpose of the further experiments that were carried on in various places to test the preventive or remedial action of sulphate of copper compositions. The results of the later experiments confirm the experience of previous trials, and show that the treatment of Potato plants with mixtures of sulphate of copper operates in certain circumstances as a check to the malignant affection caused by the fungus, *Phytophthora infestans*.

EXPERIMENTS BY THE ROYAL AGRICULTURAL SOCIETY AT WOBURN.

The following conclusions may be drawn from the results obtained:—

1. That neither the ordinary Bouillie bordelaise, nor the Bouillie bordelaise sucrée, had an entirely preventive effect, though both of them, when applied early and before disease appeared, succeeded in lessening the extent to which disease proceeded.

2. That neither dressing when applied after disease appeared had any material effect in curing the disease.

3. That the addition of sugar to the ordinary mixture did not constitute any advantage, but only added to the expense.

4. That the effect of either dressing upon the weight of produce was uncertain, but tended in the majority of cases to increase rather than to diminish the crop.

5. That, in view of the lessening of disease, and the increase, in the majority of cases, of the crop, the early application of the ordinary Bouillie bordelaise is to be recommended as a remunerative one.

EXPERIMENTS BY THE ROYAL AGRICULTURAL SOCIETY IN 1892.

Six different localities were chosen—five in England, viz., in the counties of Kent, Beds, Devon, Lincoln, and Cheahire; and one in (South) Wales. Putting together the results obtained from the different stations, excluding Cheshire, there is a unanimous verdict upon four points:—

1. That the dressing with Bouillie bordelaise, though it does not entirely prevent disease, has a marked effect in lessening the extent to which disease spreads.

2. That associated with the lessening of disease is an almost certain increase of crop, which more than pays for the cost of application of the dressing.

3. That the best treatment is an early application of the mixture before the disease has made its appearance, and this should be repeated if the marks of the first dressing have been removed by rain.

4. That, even if delayed until disease comes, a lessening of the spread of disease may to some degree be effected by a late dressing, and the crop, as a rule, will be sufficiently increased to pay for the application.

The results in Cheshire appear to be the only ones that tell adversely to the utility of the dressing, and even here, in the case of one of four crops experimented upon, a large gain in yield was experienced.

EXPERIMENTS BY MESSRS. CARTER & CO., AT BROMLEY.

In 1892, Messrs. Carter carried out a series of experiments with the varieties of Potatoes, the special object being to prove whether it would pay Potato-growers to insure, as it were, their Potato crop against disease by dressing them twice with Bouillie bordelaise, as a part of the regular routine of Potato cultivation, at a cost of about £1 per acre. They hold, and it is considered with much reason, that they have shown by the results of their experiments that such preventive dressing will pay, seeing that the yield of the dressed portions of the trial-ground was at the rate of 2 tons per acre more than that of the undressed parts. The quality of the Potatoes also was undoubtedly better on the dressed plots.

A noteworthy feature of Messrs. Carter's experiments is that double the quantity of lime was used for them as compared with that used in the experiments conducted by the Royal Agricultural Society for the Board of Agriculture.

EXPERIMENTS IN IRELAND.

With respect to the experiments made by the Agricultural Department of the Irish Land Commission, it appears that there was disease present more or less in all the districts where the experiments were conducted. On all the plots that were not treated with sulphate of copper compositions disease showed itself in ratios of from 2.9 to 15.7 per cent. of the total yield of tubers.

On six of the plots treated with the mixture there was absolutely no disease, and on the others the weight of diseased tubers ranged from 0.03 to 11.0 per cent. of the entire crop.

Other experiments carried out at the Albert Model Farm, Glasnevin, on four treated plots sown with a variety of Potatoes (Kemp's) liable to disease, the average quantity of diseased tubers was 34.36 per cent., as against 60 per cent. upon an untreated plot.

At the Munster Agricultural School the average quantity of diseased tubers in three sets of treated plots was 7 per cent., against 10.5 per cent. on untreated plots.

COST OF THE APPLICATION.

The cost of dressing, as given by the reporters in England, runs from 8s. 4d. to 9s. 10d. for one application. This depends upon the price of labour in the district, and the quantity of bouillie required. In Ireland the cost ranged from 7s. 8½d. to 9s. 1½d. per acre for each application.

EFFECT ON POTATOS AS FOOD.

It is known that copper occurs naturally in many food substances, but only in minute quantities. Therefore, in order to ascertain if any portion of the mixture applied had been absorbed by the leaves or stalks of the plants which had been sprayed, two samples of leaves and stalks, one of which had been treated with the sulphate of copper and lime mixture, and the other with the sulphate of copper, lime, and treacle mixture, were submitted to Sir Charles Cameron for analysis. A sample of tubers grown on the first-mentioned plot, the foliage of which was analysed, was also submitted for analysis.

The results showed that each sample of leaves and stalks absorbed a certain amount of copper, but that the tubers did not contain more copper than might

be found in any samples of tubers, the foliage of which had not been so treated.

INSTRUCTIONS FOR APPLICATION.

In a circular issued by the Agricultural Department of the Irish Land Commission in June, 1893, they call attention to the following important matters which have to be attended to:—

1. Spray during dry weather, so that the mixture may remain on the foliage; if heavy rain falls within six hours after spraying, it would be advisable to spray again on the first favourable opportunity.

2. Use only pure copper-sulphate, guaranteed to be of 98 per cent. purity; buy it powdered, or powder it before use; ordinary commercial sulphate of copper contains a large amount of iron, and should not be used. Pure copper-sulphate costs about 3s. per stone when purchased in small quantities, and can be obtained from the leading druggists.

3. Take care that the lime used is pure, well burnt, and unslacked.

4. Cold water should invariably be used in preparing the mixture; hot water should not be used. The lime, after being slacked, should be quite cool before being added to the copper solution; it may be cooled by adding cold water.

5. Iron vessels should not be used in preparing or handling the mixture; wooden vessels are the best.

6. Empty paraffin barrels have been found very suitable for the preparation of the mixture; it will generally be found most convenient to prepare the mixture in the field in which it is to be used.

7. The mixture should be well stirred with a piece of wood on each occasion before a fresh supply is drawn for the spraying-machine.

8. The spraying-machines should be oiled before being used, as there is a good deal of india-rubber in the working-parts of the "Eclair," pure olive-oil should be used for lubricating; ordinary machine-oil should be avoided, as it frequently contains paraffin, which dissolves india-rubber.

9. One man, attended by a boy, can apply about 9 or 10 gallons of dressing with a knapsack-spraying machine in one hour. One boy can attend three men using knapsack-sprayers, carrying fresh supplies of dressing to them.

10. The quantity of the mixture to be applied per acre is approximately as follows, the mixture when prepared costing about $\frac{1}{2}$ d. per gallon:—

Crop.	Per Statute Acre.	Per Irish Acre.
For an average crop of Champions with fully-developed foliage ...	160 gallons.	160 gallons.
For a crop of Champions with more than average foliage ...	150 "	240 "
For a crop of Champions with small development of foliage ...	80 "	130 "

11. When dressing Potato-plants which are very young, or of tender-leaved varieties, it would be desirable to weaken the mixture by the addition of one-third more water than is usual.

12. Sulphate of copper being a poison, the vessels in which the mixture is prepared should not afterwards be used for holding food or drink for animals.

We should like to recommend that in any future experiments in checking Potato disease, a plot should be devoted to a trial of the Jensenian or high-moulding system, as this does not check the growth of the crop so much as the bouillie applications, and it has been found effectual even when disease has set in. *J. J. Willis, Harpenden.*

OUT-OF-DOORS FLOWERING PLANTS.

A GREAT many of the more tender herbaceous plants which, owing to the mild weather, had been making a brilliant show, have at last been cut down by frosts. I have never known Dahlias cut flower in such profusion as this year, Pompon and single-flowered varieties being especially so. The roots of

these plants may now be carefully taken up, and placed in their winter quarters, after allowing the soil about them to get dry. It is always well to retain about 6 inches of stem, for convenience of handling and attaching the label. Do not lift the roots in wet weather, or break them. Dahlia roots keep perfectly sound in a frost-proof dry shed or cellar. If the roots are bedded in dry mould, overmuch shrivelling will be prevented, and in the case of thin tubers, this will prevent their drying up past recovery.

Begonias.—These did not succeed as usual during the summer months, owing to the drought, the zonal Pelargoniums making the best show; but after the rains came the reverse was the case, the Begonias growing and flowering extremely well, and when the frost came they were in fine order. I have lifted the tubers, and placed them in the vineries, and in here they will remain for at least three weeks. In digging up the tubers I cut off the tops within a few inches of the tuber, shook away all the loose soil, and took great care not to bruise them. It is essential that the sorts be properly labelled. In about three weeks' time the tubers should be examined, and turned over a few times at an interval of a day or two, till fairly dry, when they should be put into shallow boxes. At one time I used to put fine dry soil or sand over them, but this is not needed, the bulbs keeping quite sound without this, so long as the tubers are stored in a cellar or shed where frost cannot enter. A too dry or very airy place should be avoided, as the bulbs would then shrivel.

Salvia patens and *S. patens alba* have tuberous roots, and these may be lifted and stored in boxes of moderately moist soil, in a cold frost-proof pit.

Marvel of Peru needs similar treatment to Dahlias. *Verbena venosa.*—This plant comes true from seed, and flowers freely the first year, if the seeds are sown early, and the young plants nursed in heat, hardened off, and transferred to well-prepared beds in May; but many gardeners prefer to take up some of the roots of the old plants and place them in boxes, keeping them in cold frames till the spring, when if put in heat, they soon throw up shoots, which may be taken off and struck in mild bottom-heat.

Echeverias.—Many gardeners box these plants, and store them in a cold glass-house or pit, &c.; but where boxes and house-room are scarce, the plants may be wintered outside at the foot of a west wall; when the plants are taken up out of the soil, the lower leaves and young plants should be removed. Stack the old plants firmly and closely together, in half ridges, starting with the first row at a distance of 2 feet away from the wall, and follow on, row after row, gradually sloping the face of the plants towards the face of the wall. In this way they withstand the winter with but little protection, especially if the ridge is somewhat steep. *H. Markham, Mereworth Castle.*

HARDY ORNAMENTAL TREES AND SHRUBS.

So far as my own observation goes, a good many young gardeners do not give the amount of attention to this branch of their business which its importance and interest demands and requires. In some places the management of the trees and shrubs is deemed of more consequence than even the kitchen garden, and that is saying a good deal, for we all know the dire results of not keeping the pot boiling; and as no young man can with certainty forecast what or where the change and chances of life may bring him, it is incumbent upon him that he should fortify himself with a store of knowledge upon every branch of his business if possible, but more especially upon one of such universal interest as the subject of this paper. The furnishing of glasshouses with plants was in former times very different to the fashion of to-day as regards the number of species and varieties cultivated; people then seemed to try to have one or two plants of everything they could get hold of, but the prevailing custom now-a-days

appears to be to cultivate some favourite plant, or class of plants, in quantity, to the exclusion of many interesting subjects that are rarely seen outside of botanic gardens, and are not always easy to find even there. But if the field of interest be narrowed in our greenhouses by the prevalent custom of special culture on a more or less large scale, the same cannot be said concerning outdoor plants, for never have we been richer in hardy trees and shrubs than we are at the present time.

The first step towards gaining a knowledge of plants is to get to know their names accurately, both Latin and English, so far as that can be done, as well as the synonyms of such as happen to be hampered with more names than one. This can be done through the help of friends who already possess such knowledge, through visits of observation to botanical gardens, arboretums, and public parks, as well as by the consultation of books and nurserymen's catalogues, &c., and, as a last resource the editors of our garden papers are always willing to help in such matters on certain specified conditions. Gardeners as a rule are not easily deterred from attaining their ends—they are often face to face with some difficulty, and so become as it were inured to efforts of perseverance, and we have on record some noble and encouraging examples of men among them who pursued knowledge under most adverse circumstances but who ultimately gained success by dint of unflagging application. If it be true that love laughs at locksmiths, the love of plants may be included, for it is almost impossible to keep knowledge away from a person who is bent upon acquiring it. "So if at first you don't succeed, why try, try again!"

I need hardly say that this is not a treatise upon the management of trees and shrubs, but merely an attempt to stir up an interest in them among the class of men into whose hands their management will in the course of time largely fall. In this country we have never far to go ere we find some specimen of tree life to contemplate, for in field, forest, and city, trees and shrubs meet us and greet us everywhere, we are fascinated by the infinite variety of form in individuals as well as in the different species, by the endless variety and beauty of shape and colour in the foliage, and also by the changes induced in them by the progress of the seasons, the action of the wind upon their movements, their shallows in the water, &c., while the uses to which they may be put and their adaptation (some of them) to nearly all manner of positions that are natural are of the greatest benefit to mankind and to animal life generally.

In trade catalogues we find certain things classed as forest trees, while others are placed under the heading of ornamental trees and shrubs. This arrangement is without doubt quite convenient and proper for trade purposes, but no injustice would be done to the trees if they were all placed under one heading, for I hold that all trees and shrubs are ornamental when seen under favourable conditions; and as regards favourable conditions, we may often make notes by the way, mentally and otherwise, as to the suitability or unsuitability of certain things for a given purpose. Knowledge gained in this way is most useful, and can be turned to good account as opportunities for so doing occur.

A few short lists of plants for special purposes or having special qualities, with some incidental remarks, is as much as I can put within the limits of this paper. Conifers are a very large and interesting class of trees of first-rate importance, both as ornaments in the landscape, and as yielding perhaps more timber than any other trees. In size they range from *Pinus Mughus* and *Picea Clanbrasiliana*, which are rarely seen more than a few feet high, up to trees of the most gigantic stature. Members of the genera *Cupressus*, *Juniperus*, *Retinospora*, *Thuja*, *Sequoia*, *Taxus*, *Cryptomeria*, and others, are commonly made use of as shrubs in a young state, and fine sentinel-like figures many of them make when not planted too thickly, or crowded, or overtopped by other things, but the bulk of them grow into trees of timber-size in their native habitats, and

some of them even in this country. Our common Yew, *Taxus baccata*, is one of the hardiest of trees, and lives to a more than patriarchal age, some say as much as a thousand years, but this would perhaps be difficult to verify. The Irish Yew, *Taxus fastigiata*, is most frequently seen in an upright form, but this is not by any means its universal natural shape and character, but one imposed upon it by training, tying, and the knife. When left unmolested, the Irish Yew has mostly a peculiar spreading and sprawling habit, which makes it very interesting in aged specimens. The Japan Yew, *Taxus adpressa*, makes a dense, hardy bush, or small tree, and is useful in a mixed shrubbery, as well as ornamental as a single specimen on a lawn. The Hemlock Spruce, *Tsuga canadensis*, is one of the finest objects that can be planted on a lawn in a sheltered place, its lower branches dipping down and touching the ground, and then curving upwards, give the tree a most novel and striking appearance. The Cedar of Lebanon, *Cedrus Libani*, when fully developed, stands out as a very king among trees, by reason of its majestic appearance; and among deciduous trees may be noted the Tree of Heaven, *Ailanthus glandulosa*, which in foliage somewhat resembles the Walnut, but botanically is quite distinct from that species. I have read somewhere that in China and Japan silkworms are fed and reared on the young foliage of this tree, but its chief value in this country is as a quick-growing nurse in young shrubbery plantations.

The Horse Chestnut, *Aesculus hippocastanum*, is one of the best known and most admired trees, and its pink variety is at least equally charming. The Tulip Tree, *Liriodendron tulipiferum*, is an object of great beauty when in flower, its yellow cup-like blossoms being borne in great profusion. The bark is said to be a powerful tonic, and the imported timber is, they say, used by coach-builders for panel-work. The common Lime-tree, *Tilia europæa*, is a well-known tree throughout Europe, as well for its beauty as a tree as for its economic value, and from about the end of July to the middle of August the Linden trees are a source of food—or, at least, of honey, to bees generally, while our common garden mats are made of the inner bark of some of the species.

The Plane tree, *Platanus acerifolia*, about which at one time there was a little botanical confusion, is another well-known tree, having within the memory of man been very extensively planted and reared in towns and cities, as it bears smoke and dust better than most trees. A peculiarity of trees of this species is, that they cast a portion of their bark off in flakes every year, but they wisely provide themselves with a new jacket underneath the first. Another remarkable thing about the Plane tree is, that the incipient leaf-buds are not axillary as in most other trees, but are completely enveloped by the base of the leaf stalk like an extinguisher on a candle.

Among smaller-growing trees, may be noted the Mountain Ash, the Manna Ash, various Thorns, Acacias, Ilexes, the deciduous Cypress, the Almond tree, many members of the genera *Pyrus*, *Mespilus*, *Cerasus*, *Laburnum*, *Hollies*, &c., and *Tilia heterophylla*, *Fagus asplenifolia* and the cut-leaved Alder should not be left out. Large-growing shrubs are represented by *Cornus mascula*, which is one of the earliest to flower; by Laurels, *Rhododendrons*, English, Spanish, and Portuguese Brooms, double Gorse, Lilacs, *Tamarisks*, *Azaleas*, *Deutzias*, *Prunuses*, *Kalmias*, *Andromedas*, *Ligustrums*, *Ribes*, *Pernettyas*, *Barberries*, *Laurustinuses*, *Daphnes*, *Syringas*, *Cotoneasters*, *Roses*, *Philadelphuses*, *Clethras*, *Oleas*, the Judas tree, &c.

Berry-bearing plants include *Hollies*, *Aucubas*, *Skimmias*, *Pernettyas*, *Pyracanthus*, *Barberries*, *Cotoneasters*, *Mountain Ash*, and some *Roses* and *Thorns*, &c. Among plants remarkable for the beauty of their variegated foliage, are *Hollies* of sorts, two of the best being *Golden Queen* and *Milkmaid*, *Golden Yews*, *Aucubas*, *Euonymus*, *Elaagnus*, *Osmanthus*, &c.

Weeping trees have notable representations in

the Weeping Ash, the Birch, the Elm, the Yew, *Taxus Dovastoni*, *Sophora japonica*, *pendula*, &c. Trees with coloured foliage are seen in the Purple Beech, the Purple Hazel, Purple Oak, the Concord Oak, *Prunus Pissardi*, some of the Japanese Maples, the White Beam Tree, the White Poplar, *Shepherdias*, &c.

Trees whose foliage dies a bright colour are the Scarlet Oak, *Liquidambar*, plum-leaved Thorn, snow *Mespilus*, *Rhus Cotinus*, Ghent *Azaleas*, &c.

For covering the ground, or filling among other things, the following are suitable, *Polygala chamaebuxus*, *Hypericums*, *Periwinkles*, *Gaultherias*, *Epigæas*, *Ivies*, *Berberis dulcis nana*, *Butchers' Broom*, *Heaths*, *Sun Roses*, &c.

The following ought to have well-chosen warm sheltered situations. They are not adapted for general planting in all parts of this country, but they are all worth bestowing a little trouble upon where that will suffice. *Paulownia imperialis*, *Catalpa syringifolia*, *Myrtles*, *Pomegranates*, *Chimonanthus*, *Ceanothus*, *Escallonia*, *Camellias*, *Desfontaineas*, *Althea frutex*, *Hydrangeas*, *Cistus*, and many other equally beautiful plants which cannot be named here, as I am afraid my paper is already too long, and these lists are not intended to be exhaustive, but merely illustrative so far as they go. *F. Harrison, Knowsley Gardens, Prescott, Lancs.*

MUSHROOMS AND TOADSTOOLS IN 1893.

SUCH an exceptional period as the summer of 1893 cannot but have exerted some influence over all vegetation which depends to a very large extent upon climatic influences. Upon the general production of Mushrooms and Toadstools there has been a sinister influence during the past three or four years, but which seems to have reached its climax in the last. All experienced fungus-hunters are well aware that it is some years since a good fungus year has been known. There have been no such prolific crops in the woodlands as were known generally some ten years ago, or perhaps rather more, for there has been a gradual falling away for the past nine or ten years; and no other cause can be assigned for this but climatic conditions—the dampest and most sheltered localities for a long time suffered the least. This present year we have tested two or three favourite localities, at the usual period, and found either absolutely nothing, or exceptionally few fungi. Epping Forest, in September, was scoured for hours without finding twenty different species of Agarics, whilst the number of individuals of each species was equally small. In favourable seasons, from eighty to one hundred species would have been recorded in the same period of time. Our personal experience now extends over thirty years, so that we have a good range for comparison. There is one singular fact with regard to the present year, which seems inexplicable, and that is the profusion, in some localities, of the common Mushroom. We have heard of tons being offered for sale at nominal prices; and, in the Metropolis, we have observed lower prices than we ever remember in any previous year. The oldest inhabitant has no experience of Mushrooms at 2*d.* per lb., and that during a year in which we have found no single specimen of the ubiquitous *Agaricus laccatus*, or seen a *Lepiota* of any kind.

In previous years, when there has been but a poor crop of fungi generally, it has been observed that rare species have made their appearance, and this year has been no exception. Not long since a mycological friend informed us that he had met with several species which had not appeared in his locality before; another remarks that a number of strange things have turned up; from a third locality we have had a curious Agaric with gills of a verdigris-green, and pale-tinted spores, but evidently belonging to the sub-genus *Schnitzeria*, reminding us of the *Agaricus (Lepiota) Morgani*, with greenish gills, from the United States. It is very many years since we have heard of the occurrence of *Agaricus (Psalliota) cre-*

taceus, and this year a number of fine specimens were sent us from Scotland, and we had the pleasure of eating them for the first time. Thus much, then, for the general dearth of fungi, and abundance of Mushrooms. The fungus forays, sometimes so common with local natural history clubs, have this year been very limited. Not even the Woolhops Field Club put in an appearance, the Essex Field Club postponed it to the latest, and with others there was “no sound, but silence.”

On October 14 the West Kent N. H. Society had a Saturday afternoon stroll from Orpington to Chislehurst, when about forty species were found and recorded, but the number of individuals of each was extremely limited. In a moderately good year the locality would have been undoubtedly favourable, but the previous showers came too late to be of much service. The species cooked and eaten at the high-tea were *Paxillus involutus* and *Boletus scaber*. Not a single specimen was found of any species of great interest during the afternoon, excepting, perhaps, *Agaricus (Collybis) vitellinus*, which is by no means common in this country.

The only other excursion in which we participated was that of the Essex Field Club, in Epping Forest, on Saturday, November 4, and although the weather was favourable, the dearth of fungi was remarkable. Notwithstanding the search of a considerable party during the day, and several small collections which were sent in, the number of species recorded was under sixty. Nothing of special interest was found, and only one British species new to the county. At the meeting in the evening, one of the members produced a specimen of the rare *Fomes roseus*, growing on decayed wood, on which it had appeared for three years. This is the first record of its appearance south of the Tweed. During the evening a brief but interesting discussion was carried on with reference to the cultivation of Mushrooms in the county on an extensive scale, and some interesting facts elicited as to experiments in field-cultivation, which, it was contended, might be made remunerative. Nearly all the species exhibited were of the commonest kinds, and some of these, such as *Agaricus laccatus* were remarkable for their absence. *M. C. C.*

STOKE PARK, SLOUGH.

THIS, the property of Wilberforce Bryant, Esq., is a finely-timbered estate, of some 530 acres, in one of the pleasantest parts in the county of Buckinghamshire. From the terrace of the noble mansion grand views are obtained; on the one side over the richly-timbered deer-park, the lake of some 12 acres extent, and away into the country beyond, the church of Stoke Poges on the edge of the park coming into the view. On another side, at the end of a glade, Windsor Castle appears, its stately towers making a picture-like termination to the scene.

Around the mansion the gardens were well and judiciously laid out and planted, and time has allowed of the various trees to assume stately proportions, and of the shrubberies in which the *Rhododendrons*, *Laurustinus*, *Portugal Laurels*, and other bright green-leaved evergreens predominate, to form the screens and shelters which the designer had in view. Thus, even close to the house, many beautiful and secluded walks appear where little of the surrounding gardens can be seen, except where openings in the shrubs allow of the eye taking in some or other of the fine Conifers.

Few views in gardens can excel some of those in the grounds of Stoke Park. At the end of one of the walks near the mansion a noble *Araucaria imbricata* of perfect shape, and about 50 feet in height, is visible, backed by *Cupressus Lawsoni* and *Abies*, on each side and in front of the central object being specimens of *Libocedrus decurrens*—that on the left-hand straight and columnar, some 60 feet in height; that on the left more oval in outline, and slightly less in height. Winding beyond this fine garden-group, the walk leading to higher ground discloses through a vista in the trees, another fine view of Windsor Castle. Passing on to

get to the plant-houses, many fine specimens meet the eye. In one sheltered spot *Cephalotaxus Fortunei* has reached a good size, and is a healthy specimen; although its beauty will not compare favourably with the more regularly-formed *Conifers*. The specimens in the gardens have not suffered much through the drought of last summer, although it has been severely felt in this district, where they passed a period of seven months without a single shower. The giant specimen of *Cryptomeria japonica* has, perhaps, felt the drought most, but it is fast recovering its original dark green hue.

Passing through the well-cropped kitchen gardens and fruit grounds, where there are said to have been good crops of fruit this year, although the keeping properties of the Apples and Pears have been bad, we reach

THE PLANT-HOUSES.

Here, as in all the other departments, Mr. D. Kemp works with that skill and intelligence for which he acquired a good name years before he came to Stoke Park. Plants for flowering in winter are admirably worked, and in some of the greenhouses there is a fine show of flowers. One house is furnished with dwarf bushes of *Salvia splendens* in the centre, surrounded by winter-flowering *Pelargoniums* of all shades of colour. On the side stage is a large batch of bushy plants covered with blush-white flowers of *Begonia Knowleyana*, an old variety, which emanated years ago from Lord Derby's gardens, and which pleases Mr. Kemp so well that for many years he has annually raised a batch of seedlings, which each year at this time have formed large plants and commenced to bloom. How is it that while many inferior plants of its class have been eagerly purchased of late years, this superior old variety should have been neglected in most gardens? Plants of *Begonia parvifolia*, *B. Saundersiana*, and others, too, are well bloomed, but nothing approaches *B. Knowleyana* for floriferousness. Trained to each rafter is another favourite, viz., *Pelargonium peltatum Souvenir de Charles Turner*, from which a great supply of winter flowers is here got by pinching out all the buds which attempt to flower earlier.

In the Palm-house the white *Brugmansia* is flowering, and the Orange trees fruiting, among the Palms and Ferns. In the Azalea-house some hanging baskets of mingled *Davallia bullata* and *Adiantum cuneatum* are pretty objects. In one of the stove houses there is a beautiful display of scarlet and yellow spikes of flowers on a quantity of plants of *Genera (Nægelia) zebrina*; in others the coloured-leaved *Dracanas* and *Crotons* are splendidly grown; on the roof are plants of *Stephanotis floribunda*, in some cases very old, which promise to give a large and continued supply of flowers. One division is nearly filled by well-coloured plants of *Acalyphas*, in the background being large and graceful specimens of *Goniophlebium subauriculatum* and *Davallia Mooreana*. In other houses the large stock of varieties of *Primula sinensis*, *Poinsettias*, *Cyclamen*, *Bouvardias*, *Carnations*, and *Chrysanthemums* are all that could be desired. Among the last named the fine *Chrysanthemum Lady Lawrence* and the pretty single *C. Mary Anderson* are especial favourites.

THE ORCHIDS.

The collection of these plants is being steadily worked up; the *Cattleyas*, *Lælias*, and *Odontoglossums* are thriving in a remarkable manner, and all the various favourites are bidding well for flower. Among a varied and beautiful lot of *Cattleya labiata* we found the white-petalled form of it, which was the chief object of our visit, and a very beautiful and distinct thing it is. It flowered out of a small lot of purchased imported plants. The petals and sepals are pure white, the base of the labellum rich yellow with white veining, the front lobe of the lip pale rosy-lilac edged with white—in fact, a *C. labiata alba*, with the addition of the tinge of colour named on the lip. In the same range, plants of *C. Bowringiana* and other species were in bloom, and the forms of *Lælia anceps* and *Oncidium Cavendishi* profusely sending up spikes. In the *Odontoglossum*-houses the plants one and all are making satisfactory pro-

gress. At present there are but few in flower, but a bit of bright colour is afforded by blooms of *Sophranitis grandiflora*, some fine pans of *Pleione lagenaria*, a good example of *Oncidium ornithorhynchum*, and the old *Odontoglossum grande*. In several of the stoves *Cecylogynes*, *Cymbidiums*, and other Orchids of large growth are grown with the foliage plants, and in the fruit-houses a number of *Dendrobiums* and especially of *D. nobile*, which is here, as in most other gardens, a great favourite, are being rested and prepared for flowering. In one of the houses we observed a pair of very large plants of *Dendrobium speciosum Hillii*, which will be splendid objects when the fifty spikes or so which each is sending up are perfected.

In the fruit houses, which are of considerable extent, there is evidence of the best methods of fruit culture, and heavy crops are said to have been borne in them this year. The fruit also is said to have been fine, some of the Princess of Wales Peaches weighing 1½ oz., and of good flavour withal. In some of the houses were observed batches of *Imanophyllum*, *Callas*, *Lachenalias*, *Humea elegans*, and so forth. The *Humeas*, which want considerable management, are splendid plants, and their foliage fills the house with that peculiar odour which is so grateful to most people.

AMERICAN PARKS AND GARDENS.

(Continued from p. 586.)

THE GARDENS AT WELLESLEY AND HOLME LEA.—“Did you visit any of the private places in the suburbs of Boston?” asked the interviewer of Mr. Nicholson.

“Yes, and I found many of them most interesting on account of their plantations. This is especially true of Mr. Hunnewell's place at Wellesley, which is very well known in England, since it has been repeatedly described in English periodicals. His collection is especially rich in *Conifers*, and so far as my observation goes, his grounds and greenhouses contain a larger number of plants than any other private collection in America. Mr. Hunnewell tells me that he had almost reached middle age when he began planting forty years ago, and yet every tree now growing on his grounds has been planted under his supervision, and he still takes a most active interest in horticulture. He not only makes very liberal expenditures for specimens to add to his collection, but he loves horticulture in a public-spirited way, and it is to his munificence that the Arnold Arboretum owes the fine museum building at its entrance [see Supplementary Illustration].

“You would hardly have time to hear a full account of all the private places I visited, but I must not neglect to mention a wonderful collection of Japanese Irises brought from Japan by Mrs. John L. Gardiner, of Brookline. They were better than any I have seen in Europe, since they are cultivated apparently under nearly natural conditions. Inasmuch as I stopped at Professor Sargent's place, I became better acquainted with Holme Lea than any other, and it is the only large place I have seen in which no tender bedding plants are used for decoration, the effect relied upon being produced by the skilful use of trees and shrubs. There are large expanses of rolling lawns and many acres of natural wood, with *Hickories*, *Oaks*, and other trees, &c., some 200 years old, with a beautiful undergrowth of *Smilax* and many other native plants which we cultivate for ornament in Europe. When I say there are no bedding plants here, I do not mean that there are no flowers raised on the place, for there are flowers in profusion in greenhouses and in the flower garden for cutting. I simply mean that tender bedding plants are not used as part of the scenery. I never saw better *Gloxinias*, for example, or a nobler specimen of *Quisqualis indica* than the one which was climbing in one of the greenhouses in full flower, and furnishing an immense number of flowers for cutting every day. But besides these plants for cutting, in the borders of the wood and in the shrubbery, many hardy perennials have been naturalised. The shrubs themselves in their season make an unrivalled

flower garden, for I suppose you know that deciduous flowering shrubs do much better here than they do in England. I regret very much that I did not reach this country earlier, so that I could have seen one of your *Dogwoods* covered with its white flowers, as I have seen them in illustrations. This place is celebrated for its hardy *Rhododendrons*, which are mainly seedlings which have originated in England and have been imported from there. These broad-leaved evergreens, as a rule, do better with us than they do with you, so that it is a compliment to Professor Sargent to say that the *Rhododendrons* grow under his care almost as well as they do in the land of their origin.

“The use of *Ampelopsis Veitchii* in such abundance as I saw it covering the walls of buildings in Boston was novel to me, and struck me as being exceedingly beautiful. I do not wonder that the plant has the name of the Boston Ivy here, for the climate evidently well agrees with it. I did not see the striking autumnal tints that are produced later, but the plants seem to flourish on a larger scale than I ever saw them in Europe. Another pleasant picture I will carry away with me is the planting about the railway stations on the line of the Boston and Albany Railroad. This planting is confined to shrubs with occasional trees, but the skilful way in which they are grouped, and the use of many of the native American Roses and other shrubs produce effects which could be profitably aimed at in many other stations in this country and Europe. I saw hardy shrubs and native plants used with admirable effect also in the Walnut Hills Cemetery at Brookline, where I was very much impressed with the natural treatment of the landscape.” *New York Daily Tribune*.

TREES AND SHRUBS.

ELÆAGNUS MACROPHYLLUS.

MR. BURIDGE sends us, from the Trinity College Botanic Garden, Dublin, specimens of this handsome shrub, the flowers of which are very fragrant on a sunny November day. The plant is 8 feet high on a west wall, seven years old. The under side of the leaves is bright silver-coloured, owing to the presence of a thick coating of silvery scales.

HIPPOPHAE RHAMNOIDES.

This native shrub is beautiful throughout the autumn and winter, the Willow-like branches of the female plants being brightened with a profusion of orange-yellow fruits. It is not unlike a Willow, the branches slender, the leaves of a dullish-green colour on the upper surface, but quite silvery beneath. It grows to a height of 8 feet or more, and is very striking planted by the side of a lake or pond, as in the Royal Gardens, Kew, where a mass of the “Sea Buckthorn” as it is often called, is well established, and this year in particular, heavily laden with fruit. It is a good autumn furly berry-bearing trees and shrubs. A native shrub, but not common, and found by the seashore in sandy places, the *Hippophae* is well worth establishing in gardens, and looks well by the waterside, the graceful Willow-habit and profusion of fruit making a good winter picture. J.

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By M. TEMPLE, Gardener, Carron House, Falkirk, N.B.
PINERY.—At this season there is little moisture required by Pine plants at the roots or in the atmosphere, and the amount afforded will depend on the use of artificial heat, and the state of the weather. It may be remarked here that confined moisture condenses on the glass and metal, &c., and falls back into the house, and a good deal is caught in that way by the leaves, which conduct it to the soil about the collar, rotting the roots; on the other hand, dryness often follows hard firing, and both of these states of the air in the house are equally bad. Watering the roots periodically all at one time is also a most undesirable practice, and if the beds of plunging material becomes cold, the roots then quickly suffer, but which does not become

noticeable till growth should be active. The evils attending a too high degree of bottom-heat are long weak leaves, smallness of the rootstock, and small fruit. Root-burning has to be carefully guarded against where fermenting materials are employed, and as new leaves are added to the old at this season, there is always a danger. An air temperature of 60°, with artificial heat, except in the case of fruiting plants, need not be exceeded, and it may fall to 55° during the night; a warmth 10° higher for fruit now swelling may be allowed. Bottom-heat may range from 80° for young stock to 86° to 90° for fruiters. Fruit now ripening may require special attention, as moisture in the air of the house or in the soil tends to inferiority of flavour, and sometimes to discoloration of the fruit. When a plant has fully swelled fruit, it may be kept in good condition in a cool dry room for a week or longer.

STRAWBERRIES.—Where fruit is required early in March, forcing must now commence, or at least all preparations of the plant should be made by pricking-up the surface of the soil, and renewing it with some good loam, and a small portion of bone-meal or other special manure; but the proportion recommended to be added to the soil must be strictly adhered to, much mischief being done by overmuch manure. The pots should be washed, the drainage examined and made good if found faulty, and decayed leaves cut off. A frame or pit filled with Oak or Beech leaves made firm, and the plants placed thereon, makes a good place for starting if the heat does not exceed 50°—a little more with sunshine. Keep the plants near the glass, and give the surface of the bed a dusting with slaked lime or of soot to deter slugs. The usual forcing quarters, the shelves at the back of Peach-houses and vineries answer well at all times, as plenty of light and air is of special importance for these early Strawberries. A period of from fourteen to sixteen weeks is generally allowed for obtaining fruit. Of varieties Black Prince, Laxton's Noble, and John Ruskin are three of the earliest to ripen; Vicomtesse Héricart du Thury, Keen's Seedling, La Grosse Sucrée, Sir Joseph Paxton, and President follow these. A good fumigation with tobacco or its preparation for three nights in succession is of much service in checking the spread of aphides.

MELONS.—The crops of Melons are nearly everywhere over, but if any remain to ripen, they must have warm dry air, a dry atmosphere, and only enough moisture in the soil to keep the foliage from flagging. If fruits are fully swelled, they may be cut and placed in a dry room, with a temperature of 45° to 50°, and from which removed to heat as required.

THE FLOWER GARDEN.

By T. H. CRASP.

MIRABILIS JALAPA.—This plant, well known as Marvel of Peru, was formerly an immense favourite in gardens, but is now rarely met with; still, it is a showy outdoor plant, though not hardy enough to endure our winters. The roots should be dug up in November, and stored, like Dahlias, indoors. It is raised from seeds sown in the spring, but these seedlings do not make much display the first season. A two or three-year-old plant will, on the contrary, flower profusely for four or five months in the summer and autumn if the season be not unusually wet. It is a plant that gardeners in warm parts of the country might make more use of than is now the case, and give it a fair chance. In the south it may be sown on a warm sunny border, and in colder parts in pots or pans placed on a gentle hot-bed. The seed germinates quickly, and as soon as the plants are large enough to handle, they should be pricked off and treated in the same way as regards hardening off, &c., as any other half-hardy plant. Stored roots may be started at the end of March or in April, potting them in loam two parts, decayed manure, and just sufficient sand to make the soil porous. Water sparingly at first, till growth commences.

SENECIO PULCHER.—This is one of the most beautiful of hardy herbaceous plants, and should be found in most gardens, and although rather difficult to manage, it amply repays the gardener for his pains. It delights in a rich, moist, well-drained soil, and is almost hardy in southern parts of the country; but to make sure of it, it should be lifted and placed in a cool frame, from which frost is excluded, remaining there till the spring. The propagation of the plant is by seeds, division of the root and cuttings, but as fertile seed is not always obtainable, the best way is to propagate it from root-cuttings, which should be put in at

the present season. The plant should be lifted and the soil shaken from the roots, the largest of which should be cut into lengths of 1½ inch long, and inserted upright in pots or pans of sandy loam, so that their tops are level with the surface of the soil. These should be placed in a house or frame having an average temperature of 50°, and as soon as the leaves are as large as a sixpence, the plants should be potted-off singly, affording them plenty of root space. By liberal treatment, Senecio pulcher may be induced to flower the following autumn, and if it does not, fine strong plants will be available for flowering the succeeding autumn.

THE ORCHID HOUSES.

By W. HOLMES, Gardener, Pickering Lodge, Timperley.

MEXICAN-HOUSE.—*Lælia anceps* and its varieties will have finished growth, and the spikes will be well advanced, some, indeed, showing bloom, and provided the stock of plants is extensive, plants may be had in good bloom for two months longer. These should now be very sparingly watered, but sufficient must be applied to preserve their freshness until flowering is past, otherwise the flowers will be lacking in size and substance. After flowering, but little water will be needed till growth re-commences, and the new roots which have formed at the base of new growths will obtain their moisture from the air. These species and varieties require a long rest. The buds on plants of *Lælia autumnalis*, *L. a. atropurpurea*, *L. a. alba*, *L. Gouldiana*, by far the very best of these, will be swelling, and the general treatment of these varieties will be the same as that afforded *L. anceps*. *L. albida* and its improved forms which are also showing flower-spikes. *L. majalis*, a very shy bloomer, should now be finishing up its new growths, and be sparingly watered for a time, when water may be altogether withheld, and the plants hung close up to the roof. *Lælia Perrinii*, *L. Dormaniana*, *Cattleya Alexandræ*, *C. granulosa*, *C. g. Schofieldiana*, and varieties, as they pass out of flower should be kept rather drier for some time. Where a good stock of plants of *Cattleya labiata vera* does not exist, purchases should now be made, these plants going at a very cheap price. A good lot of these flowering in November, furnishes as fine a show in the Orchid-house as one may expect in the month of May. We have at the present time in flower some 600 fully-expanded flowers, and some more yet to open. *Cattleya citrina* is a plant which does well in the Mexican-house if hung up near the roof; and providing the plants have had plenty of water during growth, it will now be maturing, needing but little more water from this date. *Cœlogyne cristata*, now maturing its pseudobulbs and pushing forth flower-racemes, is at a rather difficult stage, as the bloom sometimes, instead of coming on, turns black and dies from too little warmth and too moist a temperature. It is therefore prudent to have the house rather dry, and not to afford much water at the root till such time as this danger is past. Our Mexican-house generally stands at from 55° to 60° during the night for the next three months, air being afforded whenever the weather permits; in fact, the bottom ventilators on one side or the other are never closed. Having a good collection of *Cœlogyne*s, flowers may be obtained from the next month to May, the earliest to flower being *C. cristata*, Chatsworth variety; then come *C. c. Lemouiana*, *C. c. maxima*, a variety of much size and substance, and more flowers on the spikes. The latest are *C. c. Trentham* variety and *C. c. alba*.

THE KITCHEN GARDEN.

By H. C. PRINSEP, Gardener, Busted Park, Uckfield.

HINTS ON INDOORS WORK.—The severe weather has brought much of the outdoors labour to a standstill, the land in many parts being covered with snow to the depth of several inches. In such weather there is always something to do under shelter; and one of these is the preparation of Russian bast-mats and straw-covered frames for protective ends. The latter will sometimes need repairing or re-covering. The ice-houses may need to be put in order; boxes made for seed-sowing, cuttings, &c.; Potatoes sorted and surely protected from frost, the sets of early varieties being put on their ends. One of the most important of all present indoor work is the looking-over of stored seeds. Any Peas that were harvested should be threshed or otherwise separated from the seed-vessels, the seed being then spread out on a table, and all small and ill-ripened seeds picked out. This may seem to some persons excessive carefulness, but those who wish to have the best crops must select

the best seed, and this can only be done by rejecting all small and ill-ripened or weevil-eaten seeds. This cleaning and sorting of seeds accounts for the high prices charged by seedsmen, but having had much experience in this branch myself, I can safely recommend the plan to others who may not have tried it. Runner and dwarf Beans should be treated in like manner. The quantity of other kinds in store should be noted, as a guide in making out the futura order for seeds. Examine the Onions in store for decaying bulbs. Shallot and Garlic must be kept as cool as possible, or they will start into growth.

PITS AND FRAMES should have every attention, the cold frames having a lining 1 foot or more thick of tree leaves or stable litter put round them up to the wall plate, to keep out frost. The lights of cold pits and frames should be covered at night with bracken or litter with mats over all. Take care that all the air and light possible are admitted to the inmates in mild weather, and afford water with care. Expose Cauliflowers or Lettuce in pits, frames, and hand-glasses, unless the weather is very severe. Should the weather be very frosty, however, put the lights on, and keep them closed, but do not cover unless there is danger of the plants becoming severely frozen, for it is a long time to the spring, and the hardier the plants are handled, the better they will withstand the winter's cold.

MUSHROOM-HOUSE.—Fire-heat may now be required to keep up the desired temperature, that is from 55° to 60° Fahr., and very little fire-heat will be wanted if there are several new beds in the house, and it is substantially built. Continue to get materials in readiness for new beds.

PLANTS UNDER GLASS.

By B. WADDS, Gardener, Birdsall Gardens, York.

WINTER FLOWERS: THE TUBEROSE.—The very general demand for these fragrant white flowers during the winter months obliges the gardener to exercise considerable care in the management of the bulbs, so as to keep up a constant supply of bloom. A steady bottom-heat of not more than 70° is necessary for them during the dark days, and the top warmth of the pit or house of 60° to 65° by night, and 70° to 75° by day. A small amount of air should be afforded daily, and no more water at the root than is required to keep the plants gently moving, or spotted foliage will result. Daily syringing should not be the rule, but a moist air should be maintained by damping the floors and walls, and advantage should be taken of bright days to syringe early in the day with an insecticide, to keep down red-spider and thrips. A liberal supply of good plant-food must be afforded plants which have plenty of roots. The best place for plants in bloom or approaching flowering is a span-roofed house, about 12 feet wide, with a path in the middle, and a bed on each side, with hot-water pipes beneath it.

BEGONIAS.—The winter-flowering varieties *Gloire de Sceaux*, *Ingrami*, *Knowlesiana*, *nitida*, *parviflora*, and *Weltoniensis*, if required for decorative purposes, should be pushed on in a temperature of about 55° by night, 60° to 65° by day, with plenty of ventilation during fine days. These varieties are best if kept rather dry at the roots, with not much moisture in the house at this season.

RICHARDIAS (CALLAS).—These winter-flowering plants must have much attention given them. Many of the plants which are growing in 6 and 7-inch pots are now in spathe in a warm greenhouse. Richardias must not receive much water if kept in a cool house, but when they are dry, afford them a watering of clear soot-water, and ventilate daily in mild weather, or the growth will be slender and weak. Any required in quantities about Christmas-time, if showing their spathes, may be placed in a moist pit or house, with a warmth of about 55° by night, and 65° by day, removing them to a cool house as soon as the spathes begin to open. Richardias will stand nearly a month in good condition at this season in a cool conservatory; and for church decoration they are invaluable.

LAURUSTINUS.—A batch of the white-flowered variety should be placed in a warm house. Grown in 8 and 10-inch pots, they are often useful for standing in cold rooms, corridors, &c.

CHRYSANTHEMUMS.—Ethel, Peter the Great, and Julia Lagravère, good varieties for decoration at the end of December, should be kept as cool as possible, affording them an abundance of air night and day. Untrained plants of Middle Lacroix were at their best last Christmas; this year they are a month earlier.

EDITORIAL NOTICES.

Letters for Publication.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for contributions, or to return unused communications, or illustrations, unless by special arrangement.

Plants, Fruits, &c., to be Named.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.

Newspapers.—Correspondents sending newspapers should to careful to mark the paragraphs they wish the Editor to see.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

SATURDAY,	Nov. 25—Royal Botanic Society.
TUESDAY,	Nov. 28—Royal Horticultural Society's Committee, at the Drill Hall, James Street, Westminster.
FRIDAY,	DEC. 1—Dundee Horticultural Association.

SALES.

MONDAY,	Nov. 27	Dutch Bulbs, at Protheroe & Morris' Rooms. Plants, at Protheroe & Morris' Rooms. Bulbs, Liliums, Roses, Plants, &c., at Stevens' Rooms.
TUESDAY,	Nov. 28	Clearance Sale of Greenhouse Plants, &c., at Oakwood, Tottenham, by Protheroe & Morris. Dutch Bulbs, at Protheroe & Morris' Rooms. Special Sale of Tuberoses, Begonias, Liliums, &c., at Protheroe & Morris' Rooms.
WEDNESDAY,	Nov. 29	Dutch Bulbs, at Protheroe & Morris' Rooms. Important Sale of Nursery Stock at Ivy Lane, Brookley, S.E., by order of Messrs. B. Mailer & Sons, by Protheroe & Morris. Bulbs, Liliums, Roses, Plants, &c., at Stevens' Rooms.
THURSDAY,	Nov. 30	Dutch Bulbs, at Protheroe & Morris' Rooms. Great Sale of Lilies, Palm Seeds, Greenhouse Plants, Roses, &c., at Protheroe & Morris' Rooms. Established and Imported Orchids, Dutch Bulbs, Liliums, Roses, Plants, &c., at Stevens' Rooms.
FRIDAY,	DEC. 1	Important Sale of Orchids, at Protheroe & Morris' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms.
SATURDAY,	DEC. 2	Dutch Bulbs, at Protheroe & Morris' Rooms. Liliums, Roses, Plants, Bulbs, &c., at Stevens' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—41° 4.

A SHORT time since we had the pleasure of publishing a statement from Messrs. SUTTON relating to their success in obtaining a cross with *Solanum Maglia*; and now, after having had the opportunity of seeing the crop, we are in a position to give some further details concerning it. But, as some few years have elapsed since experiments in this direction were first talked about, it is desirable to recall some circumstances which may have slipped the memory of the reader,

Amongst other means of evading or of palliating the disease caused by the *Phytophthora*, it was suggested that an attempt should be made to break entirely new ground, or to infuse fresh vigour into the Potato by the introduction of species heretofore uncultivated in this country, and by effecting crosses between them and the best of our present race of Potatoes. With this end in view, our valued friend and contributor, Mr. J. G. BAKER, at the instigation of Lord CATHCART, made a careful study of the wild types, both dried and living, so far as circumstances permitted, and embodied the results in a paper read before the Linnean Society on January 17, 1884. In that paper Mr. BAKER distinguished six forms as sufficiently marked off to entitle them to specific rank and name. Of these six, the only one which concerns us at the moment is *Solanum Maglia*, a native of the sea-shores of Chile, thriving in rocky situations and on clay soil, but not met with either in sandy or in rich soil. The plant is found from the sea shore up to elevations of 400 feet, and does not penetrate inland beyond a few miles. It is thus, like so many of our cultivated vegetables, originally a maritime plant. What the meaning of the word *Maglia* may be we do not know. The plant was met with also by Mr. DARWIN in the *Chonos Islands*, and commented on by him in the *Voyage of the Beagle*; and, according to Mr. BAKER, it is specifically the same as that described by Mr. SABINE in the fifth volume of the *Transactions of the Horticultural Society*, and which was cultivated so long ago as 1823 in the garden of the Horticultural Society at Chiswick, where the produce was noted to be most abundant, two plants yielding in a single season about 600 tubers of various sizes, some as small as the original wild ones, which were globose and under an inch in diameter.

It has been proposed to call this Potato, in popular language, the Darwin Potato, but in consideration of the history of the plant as above summarised, the application of the name of the great naturalist would scarcely be fair to his predecessors. Although, as we have seen, it was in cultivation at Chiswick about 1822 or 1823, and although it was reintroduced to Kew in 1862, and cultivated there since that year, it does not appear that anyone undertook experiments with it until Messrs. SUTTON took the matter in hand. In 1887 those gentlemen succeeded in obtaining a cross from *S. Maglia* received from Kew, by pollen of a form of ordinary *tuberosum* (a seedling from *Victoria*). The produce was two perfect seeds only, but from the plants so obtained called "H.1,'88" and "H.2,'88," Messrs. SUTTON secured in 1888, outtings and rooted suckers, and from these in succeeding years they obtained successive crops of tubers. These were grown in the trial plot, in rows, side by side, under exactly the same conditions, two rows of *S. Maglia* being grown for comparison. The tubers of this species, as here grown, are cylindrical, oblong, obtuse, rather irregular, with a purple skin, and deeply-sunken eyes, the young shoots whitish; the flesh is firm, whitish, externally more or less purple towards the centre. With regard to the colour of the tubers, however, it is remarked that it varies with age and exposure, and tubers that when dug were pale in colour, subsequently become more or less coloured, the *Maglia* tubers proper being always dark coloured.

It is not necessary to repeat here all the details which have been carefully recorded by Messrs. SUTTON, but it is necessary to advert to the history of the cross designated as H 2,

1888. This, as we have seen, was originated as one of the twin seedlings originally obtained by crossing *S. Maglia* with the pollen of the *Victoria* seedling. In 1892 Messrs. SUTTON record of this seedling the following note:—

"1892. H. 2/88. This seedling has been grown in flower-pots for three years, on account of its weakness, but this year (1892) it was planted outdoors, which much improved it in size of tubers. Although a most trying season, there was no trace of disease. Three tubers were planted, but one failed; upon lifting the two plants on October 11, 1892, "the" crop consisted of twelve tubers, very handsome, white, and round, in shape somewhat resembling *Schoolmaster*, with a very beautiful skin.

"1893. H. 2/88. Six tubers planted this year, and upon examination of the tubers when lifted, four roots were found to be of the same type as the previous year, and these produced an extraordinarily large crop, but not quite so round in shape as last year. The other two plants ran back to very small tubers, and a large quantity of delicate fibrous roots, but the haulm was the same in every respect as the four plants just described, being very strong, leaves rough like *Victoria*, but the points of the shoots resemble those of H 1/88."

As we saw it, the crop of this seedling was large, the tubers rounded, somewhat irregular, white-fleshed, and subject to premature growth or supertuberation, doubtless in consequence of the occurrence of wet weather following the long dry hot summer. In quality and in quantity the crop was very remarkable.

We now come to the series of crosses made in July, 1891, between the pollen of the two hybrids, H.1,'88 and H.2,'88, with *Imperator* and with an undetermined variety respectively. In the following year, 1892, the extraordinary productiveness of these crosses was noted, and in the present year this productiveness is also very noticeable in some, but not in all the offspring. This may be gathered from the following extracts from the record book:—

- "10 × 91. Hybrid 1/88 upon *Imperator*. This cross produced twelve seedlings, as under:—
- No. 1. White round, lemon flesh (good shape, round), fair crop, and tubers of good size.
 2. White round, white flesh, good crop.
 3. White kidney, white flesh, good crop.
 4. White round, white flesh, very poor crop.
 5. White kidney, lemon flesh, an extraordinarily heavy crop of very fine tubers.
 6. White round, white flesh, very poor crop.
 7. White round, white flesh, fair crop.
 8. Pink mottled round, very similar in colour to *White Elephant*, but the tubers are more round than that variety, the crop being extraordinary, with tubers growing close to the stem.
 9. White kidney, white flesh, fair crop.
 10. White kidney, white flesh, poor crop.
 11. White kidney, white flesh, a very heavy crop indeed of large-sized tubers.
 12. White kidney, lemon flesh, facsimile to last, good crop.

The following details relating to the weight of the crop of the several seedlings will be read with interest, and show how great is the amount of variation:—

Out of these forty-one crosses, Messrs. SUTTON will probably not deem it necessary to retain, for permanent cultivation, more than a few. But, as we have shown, some of these seedlings are of extraordinary promise as to productiveness, whilst others are of symmetrical form, clear skin, differing also in the arrangement of the "eyes," and in their greater or less degree of depression beneath the surface.

The haulm and foliage had, of course, almost entirely disappeared at the time of our visit, early in November, but some traces still visible showed in these Maglia crosses a degree of woodiness, which leads to the inference that Potatos so endowed would be better able to withstand the attacks of the fungus than those of a more succulent, or as gardeners say, "sappy character."

Many of the crosses produced flowers this summer, and we were informed that the inflorescence and colour of the flower largely partook of the characteristics of Maglia. What power the new seedlings may have to resist the disease remains to be seen. Happily, this year the fungus did not put in an appearance except on a very modest scale. But in any case, Messrs. SUTTON have with infinite patience and characteristic thoroughness, carried on for a series of years a number of experiments which cannot fail to be of much scientific interest, whilst, as we have shown, the prospects as regards the introduction of new, and commercially profitable varieties are of so encouraging a character that

we earnestly hope Messrs. SUTTON will be induced to continue their researches, and ultimately endow us with an entirely new type of Potatos.

The Royal Horticultural Society.

We learn that a proposal is under consideration, which, if carried out, may be of great importance to the future of the Royal Horticultural Society. We do not know the full details of the scheme, but we believe it is a proposal on the part of the managers of the Imperial Institute that the Society shall rent, on advantageous terms, a portion of their ground at South Kensington on which to erect a hall for flower-shows, with offices, committee-rooms, &c. Those who remember the history of the Society, and specially those who took a prominent part only a few years since in extricating it from the foul slough which was so nearly fatal to it, may well stand aghast at the bare thought of returning to a locality where a complete wreck was so nearly experienced. The locality, it is true, was not so much to blame as some other parts of the "environment;" nevertheless, experience has shown that the locality is not favourable for the work of the Society, a more central position being much more advantageous to it. The present offices in Victoria Street are well situated and convenient, though more space is required. The Drill Hall, where the fortnightly meetings are held, was only taken as a makeshift; and, in spite of its obvious defects, it has, on the whole, not been a bad makeshift. It has found favour with exhibitors to such an extent, that of late the hall has been found not large enough to accommodate all the exhibits proffered. The Society moreover has, under existing circumstances, made more progress than during the whole time it was at South Kensington, if we except the first year or two. These and many other circumstances must be taken into consideration, and special care should be, and we are sure will be, taken to avoid any entanglement such as that which brought such discredit on the Commissioners, and such embarrassment on the Society. The Imperial Institute has not yet achieved such a measure of success as to make it politic to associate the Society with it. On the other hand, all thanks to the persistent loyalty of the President, and to the active exertions of a small body of the Fellows, some of whom are still members of the Council, the Society has once again achieved a position of independence and influence, which must be, and no doubt will be, most jealously guarded in the future. Doubtless, no definite step will be taken till the Fellows and exhibitors have been made acquainted with the full details of the scheme.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Fruit and Floral Committees will take place in the Drill Hall, James Street, Victoria Street, Westminster, on Tuesday, November 28, when special prizes will be offered for groups of *Chrysanthemums* naturally grown. At 3 o'clock, Mr. T. CRASP, F.R.H.S., will deliver a lecture on "Late-keeping Grapes."

NATIONAL ROSE SOCIETY.—We are informed that the annual meeting of the above will be held at the Horticultural Club Rooms, Hotel Windsor, Victoria Street, Westminster, on Thursday, December 7, at 3 o'clock; the Rev. W. WILKS, Secretary of the Royal Horticultural Society, will take the chair. The annual dinner will take place at the same hotel on that day at 6 P.M. The dates fixed for the exhibitions in 1894 are:—the Southern exhibition, June 27, at Windsor; Metropolitan exhibition, Crystal Palace, July 7; Northern exhibition, at Halifax, July 19.

THE HORTICULTURAL CLUB.—The usual monthly dinner and *conversazione* took place on Tuesday, the 14th inst., at the Hotel Windsor, when there were present Messrs. John Lee, Harry J. Veitch, J. S. Couzens, C. G. Drury, George Paul, T. W. Girdlestone, and others. The discussion was on Cannas, and was opened with a very able and instructive paper by Mr. GEORGE PAUL, in which the history and the mode of culture were exhaustively stated. An animated and interesting discussion, in which most of the members present took part, followed, and a cordial Vote of Thanks was awarded to Mr. PAUL. Mr. CHARLES TURNER contributed some fine dishes of Apples, and also *Chrysanthemum* blooms for the decoration of the table.

TRINITY COLLEGE, DUBLIN.—The well-wooded park surrounding the University has been placed by the Provost and Board of Senior Fellows under the charge of Mr. F. W. BURNIDGE, M.A., who has also the Curatorship of the Botanic Garden.

AGRICULTURAL RETURNS, 1893.—In accordance with the usual practice, the Board of Agriculture issued, in August last, a preliminary summary showing the acreage of the principal crops and the number of live stock in Great Britain on June 5, 1893, as returned by occupiers of land and owners of live stock. The further tables now published, in advance of the annual volume of *Agricultural Statistics for 1893*, will complete the information collected as to the extent and distribution of the various crops, and the number and classes of live stock in the several divisions of the United Kingdom, including the Channel Islands and Isle of Man, and will furnish the particulars for each county in Great Britain. The features presented by these returns will, as usual, form the subject of a general report accompanying the tables of the annual volume to be issued after the close of the year. From the figures now published, we learn that the total cultivated area of the United Kingdom amounted in 1893 to 47,979,698 acres, a slight increase over 1892. Corn crops occupied 9,171,170 acres, or a slight diminution as compared with the preceding year. Green crops, including Potatos and roots, 4,462,755 acres—a slight increase. Clover and Sainfoin occupied 5,916,319 acres—a slight decrease. Permanent pastures, 27,700,381 acres—a slight increase. Small fruit was cultivated over 65,845 acres in 1893, as compared with 62,547 acres in 1892, the increase being chiefly in England. By far the largest area under small fruit occurs in the county of Kent, where no fewer than 20,458 acres are said to have been devoted to it in place of 19,821 acres in 1892. At least five times more space is devoted in Kent to small fruit culture than in any other county; in only one or two other counties does the area amount to 3000 acres, and in most cases to very much less.

DR. GEORGE BENNETT.—We learn from *Nature*, of the death of our old correspondent, Dr. GEORGE BENNETT, of Sydney. Dr. BENNETT was, we believe, the brother of the late J. J. BENNETT, of the Botanical Department of the British Museum, and the contemporary and friend of the late Sir RICHARD OWEN, and of the most distinguished men of science of his time. He travelled in New South Wales and Ceylon, and a few years since revisited his old home, when his vigour of mind and body excited the attention of all who knew him. Dr. BENNETT was ninety years of age.

SKIMMIA CROSSED WITH AUCUBA?—We have received the following from our Belgian correspondent in reference to the [?] which we felt constrained to insert at p. 626. We hope our Belgian friends will excuse us if, until further evidence is forthcoming, we still entertain doubts on the subject: "Here is the account of this hybridisation (see *Gardeners' Chronicle*, p. 626) as given to us by its originator, M. FRANÇOIS DESBOIS, one of the oldest and most experienced of our Belgian nurserymen. In 1890 he crossed a *Skimmia japonica* with the pollen of a variegated *Aucuba*. Of the entire cluster of flowers on the *Skimmia*, one only ripened seed and attained maturity. This single seed was sown, it was brown, hard, and horny,

as that of an *Aucuba japonica*. The seed was six months germinating. Now, a *Skimmia* seed germinates in a few days (three or four in a warm house). The seedling put forth three small leaves, then the stem began to grow thicker rapidly. Last year the young plant bore five branches, the leaves on which were speckled with yellow dots, but this variegation faded away during the course of the summer. This spring (1893) these five branches bloomed, but only bore male flowers; this, as we know, is never the case with *Skimmia japonica*, which is hermaphrodite [probably *S. Fortuæi* is meant. Ed]. The leaves and stems exactly resemble those of *S. japonica*, save for the swelling at the base. After blooming last spring, the branches put forth fifteen ramifications, which now bear each a large cluster of flower-buds. The plant at this time measures about a foot high, 15 inches across, and 3 inches round the base of its little trunk. It is very pretty, and resembles a *Viburnum tinus* covered with buds. *Ch. D. B.*"

GRAFTING CHRYSANTHEMUMS.—M. ALEXIS CALLIER, who introduced the plan of grafting Chrysanthemums on *Anthemis frutescens*, showed, at the Brussels exhibition on November 12, a specimen of the variety "Val d'Andorre," which measured about 9 feet in diameter, and bore 783 flowers. A special wagon conveyed this plant from Ghent to Brussels, and on its arrival at the exposition buildings, the doors had to be taken off their hinges to admit it. At the exhibition at Antwerp, which opened on the same day, four grafted Chrysanthemums were staged, *La Triomphante* measuring more than 8 feet across, and with 450 well-opened flowers; *Etoile de Lyon*, 4 feet across, and with 100 blooms, of which more than forty were of great size. All were of an unusually deep rose colour; was it only light, or in an equal degree the influence of the graft which imparted this beautiful tint to the flowers? These two fine plants were from M. JEAN EVERAERTS. M. HENRY VANDERLINDEN showed a fine Val d'Andorre, and M. A. LINDEN a good Mlle. Rose Sibours, both being grafts. We can safely prophesy that grafting will some day be generally adopted, or at least more largely than at present.

CANNA QUEEN CHARLOTTE (KONIGIN CHARLOTTE).—This is a very handsome *Canna* of relatively dwarf habit, compact inflorescence, and large flowers with broad segments of a deep red, with a wide margin of canary-yellow. The variety was raised by Mr. PFITZER of Stuttgart.

PROFESSOR MARSHALL WARD.—A Royal Medal has been awarded by the President and Council of the Royal Society to this gentleman, in recognition of the merit of his researches into the life-history of fungi.

WILLIAMS' "ORCHID GROWERS' MANUAL."—A new and much enlarged edition of this work is in the press. When we mention that this is the seventh edition, it will be acknowledged that it needs no recommendation from us.

BUENOS AYRES.—Señor CHARLES THAYS sends us a note concerning the recently-instituted Botanic Garden at Buenos Ayres, of which he is the Director. The new establishment includes an arboretum and houses affording accommodation for plants from all latitudes. Señor THAYS is desirous of effecting exchanges of seeds, bulbs, roots, &c., with other institutions similar to his own, being able to offer in return for specimens from other lands many interesting samples of the rich and beautiful flora of the Argentine Confederation. He particularly requests that all in a position to effect such exchanges will communicate with him, addressing their letters and parcels to, 1676, Calle Caceres, Buenos Ayres.

PROFESSOR L. H. BAILEY.—This gentleman has retired from the editorship of *American Gardening*, and will, it is presumed, have more opportunities of carrying on those experimental researches and practical trials which are so important.

RIVER POLLUTION.—Mr. FRANK SPENCE, in an article reprinted from the *Contemporary Review*,

points out the existing methods of purification of our streams, methods which have the very serious defects of entailing a very long delay before they are carried out, and of being imperfectly done after all. Mr. SPENCE'S proposed method of obviating this is to place the outflows of all sewage works under regular inspection by officers of the Local Government Board, just as chemical works are supervised under the provisions of the Alkali Acts. The inspector would allow the local authorities to deal with the sewage in whatever way they think proper, he would concern himself only with the results. Such a system, says the author, would transform the local sanitary authorities from "mere rate-savers for popularity's sake, into local administrators, proud that they have made their effluents odourless, colourless, and suitable for fish-life." Mr. SPENCE considers the provisions of the Alkali Act to be quite adequate to secure inspection of sewage effluents, as well as of factories.

MR. J. BURTT DAVY, late of the Royal Gardens, Kew, publishes in "Erythea" (the *West American Journal of Botany*) for September, some interesting teratological notes of plants found by the writer in California. One of the most important of his discoveries was a "plant of *Agoseris hirsuta* growing by the roadside near Lorin Station, Berkeley, which bore a number of abnormal heads," and in which the pappus had developed into foliaceous green sepals.

DUBLIN.—At the Chrysanthemum show, Royal Horticultural Society, Ireland, lately, there was the finest show of Apples and Pears ever seen in Dublin—no orchard-house samples, but all *bona fide* open air produce. Mr. LOMBARD'S Pears and Apples were superb in size and quality. The Chrysanthemums, both groups of plants and of cut flowers, were quite up to the best standards, the numerous competitions being very keen. Mrs. ROSS'S exquisite dinner-table was much admired, being a simple arrangement of Florence Davis Chrysanthemums, with suitable greenery, combined by sprays of the crimson leaves of the Persian Plum (*Prunus Pissardi*). The Lord Lieutenant and suite attended, and there were numerous other distinguished visitors.

THE ROSE-COLOURED CALLA.—This plant, of which we lately gave a small illustration, proves to be, as was expected, *Richardia Rehmanni*, originally described by ENGLER as *Zantedeschia Rehmanni*. The plant is named in honour of REHMANN, a well-known botanical collector. The plant when exhibited by Messrs. KRELAG at the Floral Committee of the Royal Netherlands Horticultural Society, received a First-class Certificate.

TADCASTER PAYTON SOCIETY.—At the weekly meeting of the above, held on Thursday evening, November 16, an excellent paper was read by Mr. CALLUM, B.A., on "The Efforts of Plants for Self-preservation," illustrated by black-board sketches. A very hearty vote of thanks was accorded to Mr. CALLUM for his interesting paper.

BOILERS.—At Kew we learn relatively little damage was done by the recent gale, but some part of the heating apparatus of the Palm-stove gave way, and as a consequence continuous pumping for upwards of twenty-four hours was necessitated. In the same night a similar accident, but on a very much smaller scale, occurred at the gardens of the Royal Horticultural Society at Chiswick.

MR. BAILEY DENTON.—We regret to have to announce the death of Mr. J. BAILEY DENTON, a very old contributor to this journal. He was in his eightieth year when he died on Sunday last. Mr. DENTON took part in the construction of several lines of railway, but agriculture was his hobby. The attention of Mr. DENTON was early devoted to the subject of land and town drainage, upon which he has long been recognised as an expert. The purification of sewage on land, and its subsequent use as manure, which has been carried out in several large towns, was mainly the result of his suggestion. Of

late years he had been greatly interested in another question, which the recurrence of two or three consecutive dry seasons would raise to the first rank in practical importance—that of the storage of rainfall. Mr. DENTON'S country house was at Stevenage, in Hertfordshire, and of late years he took much interest in the cultivation of Orchids.

THE CHRYSANTHEMUM.—It is very satisfactory to note the growing tendency to break away from the rigid formality and "properties" of the old florists, and to observe that a more natural style of growth of the Chrysanthemum is finding favour, and that a more attractive style of exhibiting is gradually being adopted. The tendency was observable even at the Rose shows, the most conservative of bodies in this respect, still more so at the Dahlia Show, most of all at the late exhibitions of the Chrysanthemum. The favour which the Japanese varieties enjoy has much to do with this return to good taste, and no doubt we shall improve as we go on, till the mops and mop-handles are relegated to the collections of anatomists and physiologists as interesting curiosities, fitted only for the dissecting-room of the botanists.

THE SEASON.—Elaborate records have been published as to the effect of frost on our cultivated plants, notably the excellent report published by the Royal Horticultural Society under the auspices of the Scientific Committee and the editorship of Professor HENSLOW. Is it not desirable that a similar record, it need not be on so elaborate a scale, should be undertaken, with reference to the effects of the most remarkable season those now living are ever likely to experience again? The ripening of Pears, for instance, is taking place in extraordinary fashion; on the other hand, the Chrysanthemums do not seem to have been much affected. A general review setting forth which plants have and which have not been influenced by the prolonged heat and drought should be made before the details fade from memory, as undoubtedly they soon will.

GRAPE-GROWING can hardly be regarded as very profitable, when, as we learn has been the case this season, Grapes have sold at as low a price as 4*l.* per lb. in the wholesale market, and Gros Colmar at no more than 9*l.* or 10*l.* These prices have had the effect to some extent of beating the foreign Grapes out of the market.

CHOISYA TERNATA.—Mr. GEORGE PAUL tells us that when planted against a wall, this beautiful shrub throws out roots like those of the Ivy, and by means of which it attaches itself to the wall.

HORTICULTURAL COLLEGE, SWANLEY.—The experimental committee of the Kent County Council met on the 16th inst., when the organisms found on the nodules of roots of Broad Beans were examined by the aid of the microscope, and their supposed uses in the economy of the plant discussed. The four-course rotation of cropping was next touched upon, and then Professor CHESHIRE proceeded to lecture on the germination of seeds. The next meeting will be held on Thursday, November 30.

CHRYSANTHEMUM SHOW AT BOTANIC GARDENS, GLASGOW.—It is stated by a Glasgow correspondent that upwards of 15,000 persons visited the Chrysanthemum show which was held in the Botanic Gardens, Glasgow, on Saturday, the 18th inst. The exhibition was arranged by Mr. DEWAR, Curator, at the gardens, and the magnificent display that was brought together reflects great credit on him. The show consisted of about 600 plants, there being upwards of fifty varieties. A large quantity of Orchids and Camellias were also exhibited.

THE SURVEYORS' INSTITUTION.—The next ordinary general meeting will be held on Monday, December 4, when a paper will be read by Mr. R. GODFREY (Fellow) on "The Local Government Bill, 1893" (generally known as "The Parish Councils Bill"). The chair to be taken at 8 o'clock.

TAXODIUM DISTICHUM.

It is not long since we had the opportunity of laying before our readers illustrations of this elegant and interesting tree, and of summarising what is

wall, from which the accompanying illustration is taken. The cones are much smaller than native-grown specimens, but they bear seeds of the usual three-sided form. One of the cones sent by Mr. Rashleigh was prolific, that is to say, the cone

of the cone. The texture of the fruit-scale is somewhat spongy, and in the cellular tissue, as also in the central axis, there are several resin canals of large dimensions. *M. T. M.*

FIG. 105.—TAXODIUM DISTICHUM; WITH CONES AND SEEDS.

known concerning it and its near relative in Mexico. The tree is quite hardy in this country, and attains large dimensions, as may be witnessed in the noble trees at Sion, but it very rarely produces its cones. Recently, however, we were favoured with fruiting specimens by J. Rashleigh, Esq., of Menabbly, Corn-

terminated in a branch bearing leaves and male flowers, and from the sides also appeared leaf-bearing branches emerging from between the scales. Examination showed that these supplementary branches formed no part of either bract or scale, but were entirely separate outgrowths from the axis

HOME CORRESPONDENCE.

RICHARDIA REHMANNI.—The plant figured in the *Gardeners' Chronicle* for November 4, p. 564, as "Richardia De Waal" is *R. Rehmanni*. A leaf of it has been sent to Kew by Messrs. Krelage & Sons, and I have compared it with the type specimen kindly lent to me by Professor Schinz, of Zurich, for that purpose, and find that it is certainly the same species. This plant was originally described by Engler in his *Botanische Jahrbucher*, 1883, vol. iv., p. 63, as *Zantedeschia Rehmanni*. In 1888, a specimen was sent to Kew from the Cambridge Botanic Garden, which I took to be this species, and rightly as I now find, and a notice of it was published by Mr. Harrow in the *Gardeners' Chronicle*, 1888, vol. iv., p. 570, under the name of *Richardia Lehmanni*; but as this is an evident misprint for *Rehmanni*, it appears to me that Mr. Harrow must still stand as the authority for the name, which will therefore be *Richardia Rehmanni*, Harrow. In the issue of November 4 above quoted, by some mishap the name is also wrongly quoted as *R. Lehmanni*. *N. E. Brown.*

MALFORMED CATTLEYA BLOOMS.—In your issue for November 11, I saw that a *Cattleya labiata* had opened with the two lower sepals forming two labellums, and taking the same colours, and the top sepal formed as a petal. I have also a plant with two leads which has done the same thing on both leads; but I do not care for it, as the lower sepals sit into the labellum proper too closely, and spoil the appearance of the flower. *T. W. Browning, Carass Court, co. Limerick.*

GROS COLMAR GRAPES AT THE BIRMINGHAM SHOW, NOVEMBER 15 AND 16.—For the fourth year in succession the first prize in the class for three bunches of Black Grapes, any variety, has been won by the same exhibitor and with the same variety, Gros Colmar, and also the 1st prize for one bunch Black Grapes, any variety, and J. T. Harris, Esq., Hayes Hall, Stone, Staffordshire, is to be complimented on his success. The bunches staged on this occasion were finer than ever before, the three weighing a little over 16 lb., and perfect in size and colour. Mr. Bate, the head gardener, grows this handsome Grape to a state of perfection seldom seen, as the bunches staged at Birmingham were only a sample from a vinery planted with this variety, each cane in which carries from six to ten bunches, and all equally well finished, showing how well Grapes can be grown near the pottery towns of Staffordshire where skilful attention is paid to their cultivation. *Robert Cook, Stafford.*

NARCISSI BLOOMING TWICE IN ONE YEAR.—Bulbs under the most favourable circumstances grown naturally, are not expected to bloom twice in one year, yet such is the case in the Isles of Scilly this year, and never in the history of floriculture in the islands has such a thing been known before. For some four or five years past it has been a great effort to get them in the forcing houses before the last week in December; in the open ground the middle of January was considered early, but this year they are earlier than ever. At the present time large patches of Soleil d'Or are in full bloom from bulbs that bloomed in January, not only the variety mentioned, which is one of our first to bloom, but Paper White, Scilly White, and Gloriosa, are also being cut for market. *Anemone fulgens* flowers are also being cut from beds that bloomed in March. Nearly all the varieties of Trumpet Narcissus are pushing their heads above ground. The foliage is looking healthy and strong, and the promise of bloom is good. Should there be a fine spring and summer, bulbs may be expected to be large and sound, on account of the time that will necessarily elapse between the blooming season and the season of rest. *J. C. Tonkin, St. Mary's.*

EFFECTS OF FERTILISERS ON PEACH TREES.—The following experiments, conducted by Mr. S. C. Dayton of New Jersey, should be of service to many of your readers. The object aimed at has been to ascertain the effect of various fertilisers on the gross yield, and on the net profit. The experiments were commenced in 1884. Nitrate of soda, 150 lb.,

superphosphate, 350 lb., and muriate of potash, 150 lb., were used singly, two by two, and all three together; plaster, 400 lb., barnyard-manure, 20 two-horse loads, and a mixture of 10 loads barnyard-manure and 50 bushels of lime per acre, were each used on one plot; and two plots remained unmanured. The variety of fruit is Crawford, and late Walacatoons. The first crop was picked in 1887. This was a small crop. In 1888 a good crop was secured. In 1889 the crop was again small, and in 1890 it was an entire failure, as elsewhere in the State. Last year a very large crop was picked, though poor in quality. Of the single elements, nitrate of soda has not increased the yield, plot 2 barely holding its own with plot 1 (unfertilised). Both superphosphate and muriate of potash have been effective, though decidedly in favour of the potash. The increased yields from combinations of two elements are large and practically uniform. The best yield from chemical manures is from the complete fertiliser, but this is forty baskets lower than that from the farmyard-manure; muriate of potash, however, was the most valuable of the single elements as regards pecuniary results, giving a greater net gain than barnyard-manure. The most profitable combination of two elements was that of muriate of potash with superphosphate, though nitrate of soda was decidedly beneficial when used in connection with either, and in all cases more profitable than large dressings of barnyard-manure. The largest net gain (£308 7s) was on the plot where complete chemical manure was used. To sum up: nitrate of soda alone did not increase the yield. The other two fertilisers alone, or combined, and especially complete fertilisers, were effective. The largest yield was from barnyard-manure. On the basis of cost of fertiliser per basket of Peaches, the best return was from muriate of potash alone, followed by the complete fertiliser. On the basis of selling price, the largest net profit was from the complete fertiliser. *H. Roberts, St. Mary's Hospital, W.*

THE SHANKING OF GRAPES.—In your instructive and interesting article on the shanking of Grapes (p. 624), you ask if some gardener who has had to do with shanked Grapes would try a shallow stony border, &c. I hope there are gardeners in the position to try the experiment, for from such trials as these useful results would unquestionably be obtained. Now, will you allow me to make another request, to those who are troubled with shanked Grapes, namely, to turn out of the vinery before growth commences the Vines whose fruit is most subject to shanking, fastening them carefully along the outside front in a warm sunny aspect, giving them the same kind of treatment as regards pruning, &c., as those inside, leaving on a fair crop to come to maturity, and moderately thin the bunches, and next autumn report to the *Gardeners' Chronicle* their behaviour in the matter of shanking. The Black Hamburg Vine would be the most suitable variety to experiment with, as it would have a fair chance of ripening its fruit. In some of the modern vineries, turning out a Vine for an experiment of this sort would be rather difficult, but I hope some one will be in a position to try it. It would also be interesting to know how well-managed Vines generally behave in unheated houses, especially as regards shanking. From the above remarks it will be inferred that I attribute shanking to atmospheric conditions, which, to a great extent, I believe to be the case. If a hygrometer is hung in the vinery, I think it would show in many instances a very parched atmosphere, especially on a bright cold night; and instead of the Vines being in a cool sweet atmosphere, absorbing the moisture which is in contact with the leaves, they are perspiring and exhausting themselves in dry, ungenial, and unnatural surroundings, causing attenuated and weakly growths. Much might be said on this subject, but enough for the present. Given a shallow border, as suggested at the above-mentioned page, lower night temperatures, and a month longer allowed from the time of starting the Vines to the ripening of the fruit, I think then little would be heard of shanking. *J. Easter, Nostell Gardens, Wakefield.*

PEAR CULTURE IN POTS.—Mr. Douglas writes in favour, in a recent *Gardeners' Chronicle*, of pot culture for Pears, and I am also enabled to testify to the advantages of the system. When living as gardener in Bedfordshire, I had two large orchard-houses under my charge, in which Pears and Plums were grown in pots. Of these the varieties which did best were, Beurré Hardy, B. Superfin, B. d'Amanlis, Madame Treve, Williams' Bon Chrétien,

Clapps' Favourite, and Forelle. The variety Pit-maston Duchess was grown, but discarded, the flavour not being liked. Many of our trees carried from eighty to a hundred fruits, and these not small ones. The flavour was most excellent. *T. Henry.*

HOW TO IMPROVE CHRYSANTHEMUM EXHIBITIONS.—The excellent article under the above heading (*Gardeners' Chronicle*, November 11, 1893, p. 584), from the pen of Mr. Douglas, calls for the earnest consideration of all Chrysanthemum societies, as well as for my grateful acknowledgment. That Mr. Douglas is not alone in his admiration of the prevailing style of exhibiting, is proved by the crowds that, at the Royal Aquarium, pressed round the magnificent table arranged by Mr. Jones, of Lewisham, which was undoubtedly the feature of the show. Of course all gardeners have not the means of rivaling such a table as this; but if societies would only offer prizes for blooms arranged with foliage plants, or cut foliage of any kind, leaving the mode of staging entirely with the exhibitor, our shows would gain in attractiveness, the artistic tastes of gardeners would be cultivated, and complaints of the sameness of Chrysanthemum shows would not so often be heard. Will not the National Society make the experiment for one year at the Aquarium? Let them offer liberal prizes for a small table arranged with foliage plants and Chrysanthemum blooms, without any restrictions whatever, and I fancy the result will be such that the class will afterwards find a permanent place in their schedule. I have often pictured in my mind a stand with an edging of Panicum or Selaginella, behind which is a bank of Ferns, crowned with a Palm, and a few plants of Cyperus, while rising from the Fern are good blooms, with plenty of their own leaves, of all the sections of the Chrysanthemum, the larger flowers below, the singles and Pompons above. Some years ago I proposed a class, somewhat similar to this, in a society to which I belonged. I at first met with great opposition from the party, who are against all "new fangled" notions; but at last it was carried, with some modifications, and it has ever since found a place in its show. Last week I put up a small stand on these lines, at the Finchley exhibition, to which a certificate of merit, in addition to a first prize, was awarded. This stand has been photographed, and if it comes out well I shall be happy to send you a copy. *D. Hoyle, Hendon.*

SOCIETIES.

ROYAL HORTICULTURAL

Scientific Committee.

NOVEMBER 14.—Present: Dr. M. T. Masters, F.R.S. (in the chair); Mr. McLachlan, F.R.S., Dr. Bonavia, R.v. W. Wilks, Prof. Church, F.R.S., Mr. Veitch, Prof. Muller, F.R.S., Prof. Green, Mr. Michael, and R.v. G. Henslow, Hon. Sec.

Onions Diseased.—Mr. Massee reported as follows upon the samples brought to the last meeting:—"The Onions are attacked by a Botrytis, the same species as the one described by Prof. Marshall H. Ward in 'A Lily Disease' (*Ann. of Bot.*, vol. ii.). The bulbs cannot possibly be saved now, the fungus having spent its active period on the leaves; while the hyphæ are now passing into the bulb to form sclerotia. If the foliage had been sprayed with a fungicide the mischief would have been kept within bounds. The diseased Onions should be burnt, and not thrown on to the manure heap."

Daffodil Bulb Diseased.—He also reported upon the specimen brought by Mr. Wilks, that a saprophytic fungus was now present, which had followed a disease induced by some other unascertainable cause.

Pears Diseased.—Mr. Massee sent the following additional remarks upon the fruit reported upon at the last meeting:—"The fungus attacking the Pears first appears upon the leaves, and from thence it passes on to the fruit. The tree should have been sprayed with a fungicide previous to the appearance of bloom, and once or twice after the fruit had set. Bordeaux Mixture has been proved effective." A unanimous vote of thanks was given to Mr. Massee for his interesting and valuable reports.

Job's Tears (Coix lachryma, L.).—Mr. McLachlan exhibited a specimen of this Grass, grown in Devonshire in the open air. It is remarkable for the stony involucre, often used as beads. Prof. Church drew attention to another species, *C. gigantea*, Roxb., which is cultivated in the Khasia hills, and elsewhere in Bengal. *C. lachryma* is not cultivated, though

the grain of wild plants is eaten. Prof. Church's analysis of the grain of *C. gigantea* shows that it contains 16.8 albuminoids, and 59.9 starch, &c., so that its "nutrient value" is very high, being 90 per cent. (*Kew Bul.*, 1888, p. 267).

Sphaeria Robertsii.—Mr. James Veitch exhibited specimens of this well-known parasitic fungus of New Zealand issuing from the neck of a large caterpillar (*Hepialis virescens*). It is called aweto or "vegetable caterpillar." The latter frequents particularly, if not quite exclusively, the Rata tree (*Metrosideros robusta*), and when the pupa burrows into the ground at the foot of the tree, the spores of the fungus attack it, the mycelium ramifying through the body, while the stem bearing the sporiferous asci issues erect from between the folds in the neck of the caterpillar.

Planorbis Shells Split.—Mr. Wilson sent specimens split transversely, with the following observations:—"The shells are deposited in large numbers on the bent-down Rushes at the water's edge of one of our ponds at Oakwood, Wisley. There are no signs of rats near. I much wish to know what cuts them, whether beast or bird." It was suggested by Mr. Michael that if the shell lay half in water a severe frost might possibly have effected it; but they appeared to be quite fresh shells. Mr. McLachlan suggested herons as having perhaps done it. The cause of the peculiarity, however, was recognised generally as obscure.

Winter Moth.—Mr. Wilson sent the following observations on this insect:—"On the 3rd of this month there were fifty-four females on the greased bands on our fruit trees at Oakwood. They do not usually appear so early with us. Great quantities of both females and males have been caught since the above date. Perhaps the wood and ponds are attractive to them. We have so few at Weybridge that it is not worth while to band the trees."

Cilioria Ternata, peloric.—Dr. Bonavia showed photographs and a coloured drawing (by a native) of this plant from India, illustrating transitions from the normal "Pea-like" blossom to the regular or peloric condition, much resembling a Periwinkle. The colour is a bright blue. It appears to be not uncommon in this species.

Casuarina dimorphic.—Dr. Masters exhibited a specimen received from Baron von Müller, in which a portion had developed sharp-pointed leaves exactly similar to the pointed-leaved form of Juniperus, which is often dimorphic in the same way. Mr. Henslow mentioned that these changes are paralleled by the Thuya-leaved forms of Veronica, which grow at great altitudes in New Zealand, and observed that analogies seemed to suggest varying degrees of drought or moisture as likely to be the direct cause of the different kinds respectively.

Wheat-eared Sweet William.—Dr. Masters also showed a specimen of this well-known malformation, in which, while the flowers are suppressed, the small bracts at the base become multiplied excessively. Mr. Veitch observed that it is very common, and difficult to eradicate. No cause could be suggested for its occurrence.

Canna, Madame Crozy.—Dr. Masters observed that it has been stated that this variety of Canna was really a very old form, having been figured in Loddige's *Cabinet*, No. 449; but, as he pointed out, though the colours were similar, the petals having a yellow rim, the size was very different, the modern form very probably having originated from that older variety.

Germinating Cocosnut.—Dr. Masters showed a drawing of the globular cotyledon developed within the cavity and applied against the edible endosperm. With reference to its power of secreting a ferment to digest the food, Professor Green remarked that he had not succeeded in isolating the ferment; but the epidermis of the cotyledon was quite of the character suggesting the presence of one. He noticed a fatty acid present, apparently indicating reactions produced by some ferment.

GREAT YARMOUTH CHRYSANTHEMUM.

NOVEMBER 14.—This Society held its sixth annual exhibition on the above date, and quite maintained its character as a pleasant and effective one, the spacious Town Hall in which it was held being well filled.

The Plants.—These were placed on the floor round the Hall, and the best six of Japanese varieties coming from Mr. W. Page, gr. to H. J. Foulgham, Esq., Yarmouth; Mr. W. Turner, gr. to Dr. T. Browne, Yarmouth, was 2nd; they were good, freely-

grown specimens, carrying nice heads of bloom as a rule. Mr. E. Daniels, gr. to S. V. Spelman, Esq., Yarmouth, was 1st with three good specimens. Pyramid-trained and standard-trained plants were also highly creditable to these cultivators, and the same can be said of the specimens of incurved, in all cases freely grown; and the reflexed and the Pompon varieties were also good. The best single specimen was an excellent plant of *La Triomphante*, from Mr. J. Eastwood, gr. to James Sutton, Esq., Yarmouth; and a capital plant of *Chevalier Damage* was also staged in this class.

Blooms were the leading feature, and especially the Japanese varieties. In the class for thirty-six varieties, in addition to the money-prize, a Silver Cup was given by the Corporation of Yarmouth, and this was won by Mr. W. Allan, gr. to Lord Sutfield, Gunton Park, Norwich, with a very fine stand, his leading blooms being John Dyer, Mrs. C. H. Payne, Stanstead White, Boule d'Or, Violet Rose, Stanstead Surprise, W. F. Coles, F. Davis, Coronet, Vivian Morel, Mrs. F. Jamieson, &c. Several other stands were staged, and the 2nd prize collection contained such fine novelties as Silver King, Lord Brooke, Charles Davis, Miss Anna Hartshorn, G. W. Childs, Wm. Seward, John Shrimpton, and Hick's Annette.

Twelve, three, and six blooms, were also well shown, and the whole of the classes covered a good space of tabling.

Incurved blooms were somewhat weak, but that is a general characteristic of the season. Mr. W. Turner was the only exhibitor of twenty-four distinct varieties, having blooms in good form.

Twelve, six, and three blooms, were also shown. Very fair blooms of reflexed were staged by several exhibitors, the 1st prize going to Mr. W. Turner.

A class for twelve bunches of Pompons, six of them Anemone-flowered, brought some charming stands, and they and the class for six bunches of single were much admired, the fine and striking Japanese varieties being staged in the single class, and attracted considerable attention; Mr. W. Turner took the 1st prizes in both classes.

There were also classes for epergnes of Chrysanthemums and other flowers, bouquets, &c., all being well filled.

Groups of decorative plants filled the orchestra; the best came from Mr. H. Newman, florist, Gorleston. Other plant-classes comprised Orchids, Chinese Primroses, zonal Pelargoniums, table-plants, Cyclamens, &c., all being creditably shown.

A large and imposing group of plants, not for competition, staged by Messrs. Isaac Branning & Co., nurserymen, Yarmouth, nearly filled one end of the Hall.

The Bronze Medals of the National Chrysanthemum Society were awarded to Mr. Allan for his fine stand of Japanese, to Mr. W. Page for his six specimen plants in Class I, and the Certificates of the Society to Mr. Turner for his fine stand of Japanese singles, and to Mr. J. Eastwood for his single specimen.

Fruit.—In the way of fruit, some excellent black Grapes were shown by Mr. Allan and Mr. Musk, gr. to Lord de Ramsey, Haverland Hall, the former having Gros Maroc, the latter Alicante. Mr. Musk had the best three bunches of white, staging excellent Muscats; Mr. R. H. Clarke, Yarmouth, was 2nd. Mr. Allan was particularly fortunate in the other fruit classes, taking the 1st prizes for three dishes of dessert Pears, the same for dessert Apples, and of culinary Apples. There were also classes for single dishes of Apples and Pears, the competition being good in all cases.

ULSTER HORTICULTURAL.

NOVEMBER 14, 15.—The grand annual Chrysanthemum, fruit, flower and vegetable exhibition of the Ulster Horticultural Society, held on the above dates in St. George's Market Hall, Belfast, was opened with great enthusiasm. The opening ceremony being of a brilliant character, many of the local nobility and gentry being present, and the Hon. Lady O'Neil performed the ceremony of opening the exhibition. There was an excellent display of flowers (Chrysanthemums predominating), fruits, and vegetables was made in the spacious building, the plants being dispersed through the hall, giving it the appearance of a huge conservatory. On entering the hall attention was arrested by a group of Chrysanthemum plants, which seem to indicate what might be expected throughout the show; we do not remember observing a finer group, the flowers being large, the plants dwarf, and the foliage healthy. This group obtained the 1st prize in that class, the exhibitor being W. Robertson, Esq. In the matter of

awards, the employer's name was prominently brought to the front, and the gardener's suppressed on the show-cards, which appears to us to be wrong, the award being for culture, not for possession. There were two other large groups in competition in this class, and both of much excellence, and to these 2nd and 3rd prizes were awarded to Mr. Walkington and Robert Tennant, Esq., respectively. In other fine groups, the prizes were awarded to Messrs. Walkington, Milligen, and Lord Deremore, in the order placed.

The classes for twelve, eight, and four specimens were well represented, the same exhibitors mostly appearing as prize-takers. Dividing off these brilliant circles of plants were groups of foliage and other plants, conspicuous amongst these being the large Palms, Cycads, and Ferns, from Mr. H. Dickson, interspersed with Chrysanthemums, Ericas, and other flowering plants, with a pretty band of plants of *Echeveria secunda glauca*, set in moss running round the group. Some Palms placed singly between the groups had a good effect, and were a bold kind of relief to those on the other side of the hall. The arrangements of plants were equally pleasing, but distinct in themselves. At one end a large space was devoted to some rockwork, which was executed in good taste. Mr. McKimm, Curator of the Botanic Garden, Belfast, had this work left to himself, and wisely too, as that gentleman seems far ahead of ordinary practitioners in this kind of work.

The plants on the rockery were chiefly Palms, Ferns, Dracenas, drooping shrubs and creepers. Close to this was another group of Mr. Dickson's hardy shrubs, chiefly Conifers of small growth, berry-bearing plants, and those with variegated foliage; a line of *Retinospora plumosa aurea* formed a bright yellow edging, and the whole was finished with a band of turf. This was a lesson which might afford hints to others who may wish to make decorative groups of hardy shrubs. W. C. Mitchell, Esq., Marmount, and R. Tennant, Esq., Rushpark, contributed fine groups of foliage plants intermixed with Chrysanthemums. A splendid exhibit from J. T. Walkington, Esq., was close to the end of the line of exhibits of plants in pots, which created much comment, and deservedly had 1st prize; it consisted of twelve Chrysanthemums in 6 inch pots, and it was not easy to conceive how such small pots could support such a number of stems, foliage healthy and green to the surface of the pots, and large flowers. Tables of cut flowers were extensive, and the lines of dwarf plants which backed the exhibits removed all formality, and enhanced the beauty of the flowers.

Cut Blooms.—In the class for forty-eight cut blooms, J. H. Torrens, Esq., was 1st, with fine flowers, among which E. Molyneux, Madame J. Laing, Vivian Morel, Etoile de Lyon, and Avalanche were conspicuous for fine form. In most cases, incurved varieties were more remarkable for fine form than extra size of flowers, but there were many fine exhibits of them. J. Watson, Esq., had larger flowers in his exhibit, which was placed 2nd, but they were not equal in form to the 1st prize lot.

In the class for thirty-six blooms, H. Torrens, Esq., Edengrove, was in fine form, and he secured the 1st place. His finest were Wm. Tricker, Avalanche, Vivian Morel, Edwin Molyneux, and Sunflower; Mr. Tennant was a good 2nd.

For twenty-four blooms, 1st, Jno. Rogers, Esq., his Sunflower, Vivian Morel, Colonel B. Smith, P. J. Kingston, Blond Beauty, Jeanne d'Arc, and Robert Cannell, were of extra merit. Thos. Gallaher, Esq., Ballagoland, and Mrs. Walkington, showed well in this class, and were placed 2nd and 3rd respectively.

For twelve incurved blooms, J. H. Torrens, Esq., was placed 1st, his Violet Tomlin, Mr. Bunn, John Salter, and Jeanne d'Arc, very fine. For twelve Japanese, Mr. Torrens 1st prize lot contained flowers of Mr. H. Lincoln, Boule d'Or, of extra merit. This gentleman showed well in most of the other classes. In the class for Japanese and incurved excluded, he had Delaware, Thorp, jun., Mrs. Judge Benedict, Margaret de Villagoise, very perfect in form and of good size.

The classes for trusses were not of special merit, but the effect of such being less formal, enlivened the tables. Bouquets of Chrysanthemums and other flowers were numerous, and all fairly good.

Fruit, especially Apples, was excellent, and the large exhibits, contested so keenly, showed that there were enthusiastic cultivators of fruit in the Green Isle.

The Grapes were not an extensive exhibition, and mostly represented by Gros Colmar, Lady Downes, and Alicante, the latter beautifully coloured; and the best of the prizes in the exhibits were awarded

to Lord Downshire and Lord O'Neil. The collection of fruits (ten dishes) were keenly contested; Lord Downshire's exhibit, however, was far ahead of the others. An immense bunch of Gros Guillaume Grapes, perfect in colour; another of Gros Colmar, with large Apples of brilliant colour, and Beurré Gage Pears, were conspicuous for excellence.

The contest for the best twenty-four dishes of Apples was keen, the 1st prize going to Rev. H. Pakenham, for a very excellent high-coloured lot of fruit; a very close 2nd was H. Nicolson, Esq.; and 3rd to Baroness Von Stieglitz. The twelve dishes had many keen competitors, so had all the smaller exhibits. An attractive exhibit was placed by Mr. John Moors in the class for cottagers and farmers. The Pear classes represented in many cases large fruit, but not otherwise of special merit.

Vegetables were good, especially Leeks, Cauliflowers, and Celery, the latter rather under-blanching. We measured some of the Leeks, which were over 9 inches in girth. The 1st prize collection belonged to Lord Downshire, in which were fine French Beans, Seakale (not good), Asparagus, new Potatoes, White Plum Celery, and Tomatoes.

There were numerous exhibits of utensils, insecticides, manures, &c. Messrs. Cross had a wonderful collection of immense Pears, said to be the result of the use of their manures. *M. Temple, Carron, N.B.*

CARDIFF CHRYSANTHEMUM.

NOVEMBER 14, 15.—The seventh annual exhibition of this society took place on the above dates in the Park Hall, Cardiff. The number of exhibits this year was somewhat less than on former occasions, possibly owing to the early season, but the quality, especially of the Chrysanthemums, was highly satisfactory. As usual, the competition was keenest in the cut-bloom section, there being a number of exhibitors from various parts of England and Wales, whereas in the groups the competition was purely local. With one or two exceptions, the specimen plants shown were poor, as, unfortunately, is frequently the case at the Chrysanthemum shows of recent years.

The finest group of Chrysanthemums arranged for effect in an area of 60 square feet was shown by Mr. G. W. Drake, Cathays Nurseries, Cardiff, for which he obtained a 1st prize and the National Chrysanthemum Society's Certificate of Merit for the highest cultural skill displayed in the show. The striking feature of this group, which contained all the newest and best varieties grown, was the dwarfness of the plants composing it, no plant being much over 3 feet in height. Mr. W. Treseder, Cardiff, came next with a fine group, little inferior in quality of bloom, but the plants were much taller.

In the amateur division Dr. Wallace, Cardiff, took the 1st prize for a group covering a space of 50 square feet; and Mr. Maggs, Cardiff, was as successful with a group occupying 30 square feet.

W. Stuckey, Esq., Langport, Somerset, was placed 1st for a collection of forty-eight cut blooms, half incurved and half Japanese, not less than thirty-six named varieties; Charles Davis, Etoile de Lyon, Robert Owen, and Louis Bohmer were prominent in this collection. R. W. D. Harley, Esq., Brampton Bryan, Herefordshire, was placed 2nd in this class, and was awarded the National Chrysanthemum Society's Certificate of Merit for a bloom of Vivian Morel contained in his collection, and judged the best bloom in the show.

For a stand of twenty-four blooms of Japanese and incurved Chrysanthemums, R. A. Bowring, Esq., of Penarth, obtained 1st place, some of his best blooms being Princess of Wales, Mrs. S. Coleman, and John Doughty.

R. W. D. Harley, Esq., carried off the Challenge Cup and 1st prize for a collection of twenty-four cut blooms, distinct varieties. This Cup, which becomes the property of the person winning it twice, was offered last year for the first time, and was then won by Sir C. Phillips. Owing to a fatal driving accident befalling his daughter recently, Sir Charles Phillips has not exhibited at all this year.

E. P. Martin, Esq., Dowlais, was successful in carrying off 1st prizes for a collection of six Japanese blooms and a single Japanese bloom, in both instances the variety was Vivian Morel.

For twelve blooms, Japanese, not fewer than six varieties, R. A. Bowring, Esq., took 1st place, two of the finest blooms being Duke of York and Princess May.

A collection of twelve incurved blooms, six varieties, shown by Mr. S. Horton, Cardiff, was placed 1st, Barbara, Mrs. Chibran, and Empress of India being some of the best blooms.

The fruit exhibited, with the exception of Apples, was not generally of a high quality, the judges in several instances withholding 1st prizes and only awarding 2ads. The principal prize-takers in this section were Col. Page, Sir E. S. Hill, General Lee, Evan Lewis, Esq., and Marcus Gunn, Esq., all local gentlemen.

PLYMOUTH CHRYSANTHEMUM SHOW.

NOVEMBER 14, 15.—The second show of the West of England Chrysanthemum Society was held at the Plymouth Guildhall on the above dates, and was in every respect a very fine affair; and in some respects it was superior to that held at the Royal Aquarium and Kingston-on-Thames. The competition in the champion class lay between two exhibitors from the same locality (Fareham), and their stands of forty-eight blooms were triumphs of cultural skill. Mr. Molyneux was adjudged the winner of the highest prize, Messrs. Drover taking the 2nd place; the first-mentioned had the finest Japanese, but he could not approach Messrs. Drover's incurves.

The local exhibitors in this class made a creditable show. Mr. Hammond-Spencer, Admiral Parker, and Sir J. Jenkins were amongst the most successful. The groups of plants in pots were arranged round the hall with good effect. Dr. Square was a very successful exhibitor with some good and modern varieties; and Messrs. Serpell, Norrington, and T. F. Upsher were also well to the front. Mr. Upsher's three incurved plants were remarkably good. The Cyclamen and Primulas were an interesting but by no means extraordinary exhibition, but the Orchids, though not so numerous, were good. Mr. E. Coppin, was here 1st, with Mr. Dyke a good 2nd. The banks of plants and flowers are arranged in the centre of the building most admirably. They reflect the greatest credit upon the exhibitors, particularly Messrs. Groombridge, Tot-hill Nurseries, and C. Watts, of the Globe Hotel, Plymouth. Mr. Watts was most successful with his display of vegetables, taking two 1st prizes with collections which have rarely been equalled in Plymouth.

The fruit was as unusually good as the recent favourable season would have led one to expect. Apples were the feature, and of these some extraordinary and beautiful specimens were shown. Among others who had displays, also not for competition, was Mr. Phillips, of Buckland Abbey, whose show of Chrysanthemums was both large and beautiful. Mr. Phillips was awarded the Certificate of the National Chrysanthemum Society. Mr. Smale, of Torquay, showed a fine display of cut blooms of the newest variety, and Mr. Godfrey, of Exmouth, with his Belle of Exmouth as his strong point, was also well to the front.

The fruit displays of Messrs. Veitch and Mr. Sclater, of Exeter, well deserved the honour conferred upon them in the award of the Certificate of the West of England Society, which was also given to Mr. Charles Watts for his collection of vegetables, to Mr. John Arnold, of Stoke, and to Messrs. Jarman, of Chard. Those whose energetic labours ensured the success of the show are:—President, Mr. G. Soltau-Symons, Chaddlewood, Plympton; vice-presidents, Mr. G. H. E. Rundle, Captain Castle, R.N., Mr. R. Burnard; the members of the committee, and secretaries Messrs. Charles Wilson and W. Damerell. The show was opened by the Mayor of Plymouth.

MANCHESTER.

NOVEMBER 14, 15.—The annual Chrysanthemum show, held under the auspices of the Manchester Botanical and Horticultural Society, took place in the Town Hall on the above dates. The exhibition in general was better in quality than many of its predecessors, and the display, upon entering the room, was equal to anything seen in Manchester before. The classes were not numerous, but they were well contested, and the entries were fairly numerous. Miscellaneous exhibits were present in exceptional quantity, and the quality of these, together with their arrangement, had a very great share in producing the show obtained. These included an unusual quantity of Orchids from Messrs. Charlesworth, Shuttleworth & Co., Bradford; Messrs. Heath & Son, Cheltenham; and W. K. Lee, Esq., of Audenshaw; Cyclamens from Messrs. Dickson, Brown & Tait, and Messrs. Dickson and Robinson; and a great many other contributions from various amateurs and nurserymen.

YORK CHRYSANTHEMUM SHOW.

NOVEMBER 15.—The exhibition of Chrysanthemums and other flowers and plants, as well as fruit and vegetables, which is annually held under the auspices of the Ancient Society of York Florists, was opened on the above date in the buildings of the Fine Art Institution. The Society this year offered about £200 in prizes, including handsome Challenge Cups presented by the ex-Lord Mayor (Mr. Alderman J. Close) and "the citizens." Numerous special prizes were offered by the nursery trade and residents in the neighbourhood.

The groups of Chrysanthemums formed a magnificent show, and this was especially the case in class 1, which consisted of groups occupying a space of 120 square feet. The 1st prize was a Silver Cup, given by Mr. Alderman Close, ex-Lord Mayor, which he won himself last year. There were five groups exhibited, and Mr. Alderman Close secured premier honours, with a splendid lot of plants, the blooms being especially well grown. Quality was, however, best represented in the group exhibited by Dr. Pierce, but the arrangement was deficient; and Mr. Hingston was placed 2nd. The same standard of excellence was conspicuous in the smaller groups, in which Mrs. Gutch showed a group which, for size and perfection of blooms, variety in colour, and all-round excellence, stood well to the front. The exhibition of groups open to amateurs not employing a gardener was one of the most encouraging sections of the show. There were fair groups shown, and for merit of culture and perfection of bloom they would run the larger groups a close race. In the other classes there was a very excellent show of incurves, Japanese reflexed, Anemone-flowered, and Pompon Chrysanthemums. The reputation of the show, as regards the classes devoted to cut flowers, was more than maintained.

The feature was, of course, the open class for the best collection of thirty-six blooms—eighteen incurved, and eighteen Japanese—the 1st prize for which went to the South of England. It must be conceded that the collection staged by Dr. Frankland, of Reigate, thoroughly deserved the Citizen's Challenge Prize, the incurved varieties, including a very fine Jeanne d'Arc, Mrs. Robinson King, and others, being by virtue of their excellence a preponderating influence in favour of the winner.

Mr. W. H. Tate, of Woolton, Liverpool, the 2nd prize-taker, had a fine collection, Sir James Walker, Bart., Sand Hutton Hall, and the Earl of Harrington, following in order of merit. In the next class, for twenty-four blooms, twelve incurved, and twelve Japanese, Mr. A. Milnthorpe, of Cattal, secured premier honours, and the remaining classes for professional exhibits brought out a first-class assortment of the Japanese, incurved, reflexed, and Anemone-flowered varieties. Bouquets and baskets were well shown, but there were only two epergnes.

A magnificent exhibit of eighteen cut blooms, shown by Mr. W. B. Richardson, of Elm Bank, secured the Citizens' Challenge Prize, in the class open to gentlemen's gardeners or amateurs residing within 5 miles of the city. Of the six incurved, Miss Violet Tomlin was noticeable; and the dozen of Japanese included a very fine Stanstead White and Avalanche, Florence Davies, Vivian Morel, and others; Miss Gutch was a good 2nd, and the collection shown included a grand Louis Behmer, Japonaise, &c. The amateur classes for six incurved, Japanese, and Anemone-flowered, were well filled.

The show of Grapes, as far as quality was concerned, was quite on a par with former exhibitions, but there appeared several blanks on the staging which would have been better filled in.

In the class for two bunches of black Grapes, the competition was also very keen, the bunches being wonderfully well coloured, and heavily bloomed; but in the class for two bunches of white Grapes the exhibits were not so good, but of fair average quality. The show of Apples it would be impossible to surpass.

Messrs. James Backhouse & Son, of the York Nurseries, had a magnificent lot shown, not for competition.

The *Gardeners' Magazine* Medal was awarded to Mr. W. Dickenson, Acomb, for four incurved Chrysanthemums in pots, of cultural excellence.

LINCOLN CHRYSANTHEMUM.

NOVEMBER 15, 16.—The cultivators of Lincoln and the neighbourhood held an exhibition of Chrysanthemums, cut blooms, and plants, and miscellaneous objects on the above dates. The strongest feature of the display consisted of groups of mixed plants,

arranged with an idea of a pleasing effect, the best being that of Mr. C. Foster, gr. to R. Dawber, Lincoln; and one of Chrysanthemums, arranged by Mr. Wipf, gr. to N. C. Cockburn, Esq., Hartsolme. The last-named had also the finest specimen.

Mr. Thornton, gr. to C. E. Marfat, Esq., Lincoln, had the finest twenty-four Japanese and twenty-four incurves; and Mr. Wipf the next best, as he also staged the finest Anemone and reflexed blooms.

Specimens of single-flowered varieties were the best from Mr. Bugg.

HULL AND EAST RIDING CHRYSANTHEMUM.

NOVEMBER 15, 16.—This exhibition, one of the best held out of London, took place in the Artillery Barracks, Park Street, and proved, as usual, a success in every way. On entering the building, a spacious hall is reached, on either side of which were ranged the groups of Chrysanthemums, relieved by foliage plants arranged for effect, and in the centre were two fine groups of miscellaneous plants, also arranged with an eye to good effect. On the right hand a saloon was filled with the cut blooms; the incurved and Japanese amongst these were very fine, as well as numerous shown. On the left, another room with darkened windows, and lighted by gas, contained the table decorations and other floral effects, while at the end a spacious hall contained numerous specimen plants.

The best group of Chrysanthemums and other plants was shown by Mr. Coates, gr. to W. Wheatley, Esq., Hull; the 2nd prize going to Mr. Geo. Cottram, jun., nurseryman, Cottingham, Hull. The best group of miscellaneous plants came from Mr. Wilson, gr. to James Rickett, Esq., Swanland Manor, and was probably one of the most effective ever staged at Hull; Mr. G. Cottram was again 2nd.

Groups.—The best group of plants, Chrysanthemums and foliage plants combined, was staged by Mr. Geo. Coates, gr. to W. Wheatley, Esq., Milton Terrace, Anlaby Road; it was a tasteful arrangement, consisting of flowering plants, Eulalias, Crotons, and good Dracenas, and an edging of *Hydrangea hortensis* with variegated leaves, and a few light Palms. The 1st prize in this class was a Silver Challenge Cup of the value of 20 guineas. Mr. Gledhill Cottam, jun., Alma Gardens, Cottingham, was a good 2nd, with a group lightly arranged.

Mr. G. Wilson, gr. to Jas. Rickett, Esq., was an excellent 1st for a mixed group of flowers and foliage, one of the best seen at Hull; it consisted of high-coloured Crotons, Eulalia japonica, Palms, and some good Orchids—the shape an oblong.

A well-arranged group of foliage plants and Chrysanthemums was shown by the Corporation of Hull, but not for competition.

Plants.—Trained specimens and bushes were shown in large numbers and in first-rate condition, one conspicuous feature being the exhibits of the amateurs, several classes of these having as many as seven and eight entries. In the open classes, Mr. J. Hemming, gr. to Ed. Seetham, Esq., Beechholme, Newland, was 1st, with dwarf-trained plants, bearing very fine blooms, the Rundle family comprising the trio; the 2nd best were those of Mr. Geo. Coates, all Mrs. Rundle, very fresh. Mr. Hemming was also 1st for pyramids, freely grown, and not too formally trained. Mr. Hemming had the same position with three grand standards, each plant a perfect model, bearing fine flowers, and very fresh; these were also of the Rundle family.

For six bushes, Mr. W. Goodhill, Stanley Street, Hull, was 1st, with beautiful plants of the Japanese varieties Val d'Andorre and Vivian Morel, both extra fine. Mr. Goodhill was also 1st for three plants (bushes) equally as good.

For six plants (cut-backs), Mr. H. Taylor, Newland, was an admirable 1st, the plants bearing grand flowers, the best varieties, Vivian Morel, Sunflower, and Florence Davis.

In the amateur's classes (for single-handed gardeners), the best bush-grown plants were excellent examples, shown by Mr. F. Pape, Beverley; Mr. Geo. Coates being a good 2nd. The best trained plants in this division were those shown by Mr. Robert Thirsk, Grove Hill, Beverley, all Rundles.

In the exclusive amateur classes the best were the six bushes, freely-flowered, from Mr. F. Pape, chiefly old kinds; Mr. R. Petch, Prospect Street, Hull, being 2nd, having one fine plant of Sunflower. The best cut-backs were shown by Mr. A. W. Stanley, dwarf and good. For three bush-grown plants, Mr. R. Thirsk, Beverley, was 1st, Val d'Andorre being extra fine. The finest named plants

were shown by Mr. W. H. Clark, Somerscales Street, Hull.

One of the leading classes for cut blooms was that for twenty-four incurved varieties, in not less than eighteen varieties, and here Mr. W. H. Lees, gr. to F. A. Bevan, Esq., Trent Park, Barnet, a young grower, who has this season leaped into a very prominent position by showing blooms of surpassing excellence; his collection of incurved was the finest seen this season, and included large and symmetrical examples of Golden Empress, Lord Alcester, Hero of Stoke Newington (very fine), Princess of Wales, Princess Teck, Violet Tomlin, Mrs. Coleman, Lady Dorothy, Miss M. A. Haggas, Lord Wolseley, Prince Alfred, Nil Desperandum, Jeanne d'Arc, R. Cannell, John Lambert, John Salter, J. Doughty, &c. 2nd, Mr. H. Shoemith, gr. to M. Hodgson, Esq., Shirley, Croydon, his leading flowers being Miss M. A. Haggas, Lady Dorothy, Princess of Wales, Madame Darrier, Prince Alfred, J. Doughty, Alfred Salter, and Golden Empress.

With twelve incurved, the 1st prize was taken by Mr. Musk, gr. to Lord de Ramsay, Haviland Hall, Norwich, having capital blooms of well-known varieties; 2nd, Mr. Leadbetter, gr. to A. Wilson Esq., Tranby Croft, Hull, with good blooms.

An interesting class was for twelve blooms of the Rundle family, two bunches of three blooms of each of the three varieties, well-finished flowers being staged on long stems. The 1st prize was taken by Mr. W. Goodhill, Stanley Street, Hull. The best six blooms of incurved of one variety were shown by Mr. P. Blair, The Gardens, Trentham Park, he having Annie Salter in very fine condition; Mr. Musk being 2nd with Madame Darrier, in capital character. Messrs. E. P. Dixon & Sons, nurserymen, Hull, offered a Silver Cup for twelve incurved, which was won by the gardener to Sir I. Bennett, Westlands, Grimsby. In the succeeding class, for twelve incurved, Mr. Davidson, gr. to R. F. Jameson, Esq., Hessele, was 1st, the leading varieties shown being those already named. There were several other classes for incurved blooms, mainly by amateurs, and in all cases the blooms were of a decidedly creditable character.

Japanese blooms were numerous and very fine. The best twenty-four came from Mr. H. Shoemith, who had superb examples of Vivian Morel, Mdlle. M. Hoste, Edwin Molyneux, Mrs. Ed. Adams, Mrs. C. Harman Payne, Madame Calvat, Chas. Shrimpton, Etoile de Lyon, W. W. Coles, Golden Wedding, Ruth Cleveland, Col. W. B. Smith, Mrs. Wheeler, G. C. Schwabe, Mrs. Clarke, M. Bernard, Mdlle. Thérèse Rey, John Shrimpton, Lord Brooke, W. H. Atkinson, W. H. Lincoln, W. Seward, &c.; 2nd, Mr. Heany, gr. to H. G. Schwintz, Esq., Mosley House, Liverpool, his leading blooms, which were very fine, being Charles Davis (superb), Mrs. E. W. Clarke, Princess May, Mrs. C. H. Payne, G. C. Schwabe, Boule d'Or, Silver King, Violet Reae, Mr. E. D. Adams, Colonel W. B. Smith, Excelsior, Lord Brooke, &c.

There were several collections of twelve blooms, Mr. Lees being again 1st, with excellent examples of Etoile de Lyon, Edwin Molyneux, &c.; 2nd, Mr. Musk.

Another interesting class was one for twelve Japanese, large show blooms, set up with or without Chrysanthemum or other foliage, the object being to teach a lesson as to the use of specimen flowers for decorative purposes. Mr. Musk was 1st, with fine blooms, tastefully arranged with foliage and small decorative plants; Mr. Geo. Wilson, gr. to J. Beckett, Esq., Swanland Manor, Hull, was 2nd.

Mr. Shoemith was 1st, with six blooms of Japanese, any one variety, having Colonel W. B. Smith, very fine; Mr. Leadbetter taking 2nd prize, with Madame Baco. In other classes, Japanese varieties were numerous and, on the whole, finely shown.

The Anemone-flowered, from their peculiar formation, attracted much attention, and some very fine blooms were staged, both large-flowered and Japanese. Mr. A. Smith, Woodleigh, Hessele, took the 1st prize, with twelve of the former, and also with twelve Japanese. The reflexed varieties scarcely shaped so well, but they were bright and effective, Mr. Davidson winning the 1st prize for the chairman of the committee.

A class for blooms of "hairy" Chrysanthemum brought such sorts as L. Boeber, White Plume, W. A. Manda, H. Ballantine, &c., Mr. G. E. Smith, Floral Cottage, Pavell, taking the 1st prize.

It may be added, that in all the minor classes, and they were many, the competition was brisk. The premier incurved Chrysanthemum was a very fine Lord Alcester, shown by Mr. Lees. The premier Japanese was a superb flower of Charles Davis, shown

by Mr. Musk. In the amateur's division, the premier incurved was Jeanne d'Arc; and the Japanese, Stanstead White.

Table Decoration, Bouquets, &c.—For a fully-laid table for six persons, Mrs. Douglas Joy was a good 1st, the arrangement free, light, and finished, bronze-coloured flowers, dark foliage of Mahonias and Asparagus plumosus, the chief features. The best bouquet of Chrysanthemums was shown by Mrs. H. Taylor, Newland, a beautiful shown arrangement of Sunflower (Japanese), and Smilax. For a table illustrating the decorative value of the Chrysanthemum, the 1st prize was awarded to Mr. H. Taylor, Newland, with an excellent exhibit of well-arranged floral articles.

AYLESBURY CHRYSANTHEMUM.

NOVEMBER 15, 16.—A very fine show was made in the Corn Exchange on the above days, the plants throughout being good, and the cut flowers in many cases of such even quality as to give the judges some trouble in awarding the prizes. The event of the day was the competition for the Silver Cup, value 10 guineas, given in addition to the 1st prize, for a group of Chrysanthemums, and this was secured by Mrs. Bartlett, Peverel Court, Aylesbury (gr., Mr. Turnham), with finely-grown and well-bloomed plants, well set up. Mr. R. Hopkins was 1st for nine large-flowered Chrysanthemums; Col. Lee 2nd, Miss Smith-Dorrien (gr., Mr. Tipler) was 1st for six, with a grand lot, the Vivian Morel in which also receiving the award for the best plant in the show. For six Pompons, Col. Lee was 1st. In the class for Anemone-flowered or Japanese, Miss Smith-Dorrien was 1st for six, and Mr. T. Gurney for three plants.

For forty-eight cut blooms, Mrs. Bartlett was 1st; Lady Rothschild securing 1st in both the classes for thirty-six and twenty-four blooms. Mr. Giles, Mr. Mackrill, Mr. Pigott, and others, also showed well.

In the prizes for fruit, Mr. Robins, gr. to Col. Lee, secured the 1st for three dishes.

A most important adjunct to the flower show was a cottagers' show, held beside it in the Meat Market, a most extraordinary, excellent, and varied lot of exhibits being staged by a large number of cottagers, the vast building being quite filled by the 521 entries. The whole show was a great success, and much of it, as in former years, must be attributed to the untiring zeal of Mr. W. Crasler, the Secretary.

BIRMINGHAM CHRYSANTHEMUM.

NOVEMBER 15, 16.—The thirty-third exhibition took place on the above dates, and was in every way a marked success. Good quality ruled strongly throughout. The specimen plants were, as is usual at Birmingham, exceedingly well grown, and more natural methods in training are now adopted. Mr. W. H. Dyer, gr. to Mrs. Marigold, Edgbaston, was 1st for nine large-flowering incurved varieties, for six large-flowering, for three Japanese, and for twenty-four single specimens in two classes. Mr. J. Maldrum, gr. to G. Cadbury, Esq., Selly Oak, was 2nd in all these classes.

Seven very fine large groups were exhibited in the open class, and Mr. Earp, gr. to the Right Hon. Joseph Chamberlain, M.P., was 1st, with a superb group, carrying large blooms of fine quality, and also well arranged. Mr. Dyer was a good 2nd, and five other prizes were awarded. In the class for smaller groups, there were seven exhibits, Mr. Maldrum taking the 1st prize, four other prizes being awarded.

Cut Blooms.—There was a very extensive display of cut blooms, and the competition heavy and keen in every class. In the class for twenty-four incurved, there were twelve exhibits, 1st, Mr. Neve, Radlett, Herts, with a fine lot; 2nd, Mr. A. Haggart, gr. to J. J. Foster, Esq., Moor Park, Ludlow.

A superb lot of Japanese blooms was staged, nineteen exhibits, and Mr. R. Parker, Impney Gardens, Droitwich, was well 1st, with a grand lot of blooms; 2nd, Mr. Haggart; 3rd, Mr. Earp, Highbury.

In the classes for eighteen incurved, eighteen Japanese, twelve incurved, twelve Japanese, and twelve Anemone-flowered, there was excellent competition, Mr. Walter Showell, Mr. Haggart, and Mr. Crook taking the 1st prizes in these classes in the order named.

The classes for the local growers within 4 miles of the Post Office were also well contested, Mr. Earp scoring 1st for six incurved and six Japanese in one

class; and for twelve incurved and twelve Japanese in another class, Mr. Maldrum coming 2nd in both classes.

There was a very extensive display of Chinese Primulas, as is usual at Birmingham, and many of these were more than usually fine. In the open classes, where the nurserymen exhibit, Mr. F. Denning, florist, was 1st respectively for twelve singles, six singles, and six doubles; Messrs. Thomson & Co. 2nd, in each class; and Messrs. Pope & Sons 3rd in each.

For six Fern-leaved varieties, Messrs. Pope & Sons were 1st; and Messrs. Thomson & Co. 2nd. Some admirable specimens of Cyclamen were staged, especially a twelve and a six, from the Right Hon. J. Chamberlain, which were awarded the 1st prizes.

In the gentlemen's gardeners' classes for Primulas, there was keen competition and numerous exhibits. For twelve plants, Mr. F. Jenkins, Olton, won easily with twelve fine specimens; Mr. Caldecott, gr. to Mr. Wm. Mathews, an old successful grower, securing 2nd. Mr. Palmer, gr. to William Bown, Esq., had a fine collection of Orchids, a strong exhibitor, who on this occasion had the field to himself, with excellent plants. His six plants consisted of Cypripedium Leeanum, an excellent variety; a fine specimen of C. speciosum, a fine one of Dendrobium Phalaenopsis Schillerianum, Oncidium crispum, Cattleya labiata, and a fine C. gigas. In a group, not for competition, were good examples of Odontoglossum Inseleyi var. splendens, O. Andersoni, a very fine variety; a good variety of Cattleya labiata, and a monster specimen of Lælia Perrini, with nearly 50 fine blooms on it, and supposed to be one of the finest plants in the country. A special Cultural Certificate was awarded to it.

Fruit.—In this division Grapes were a great feature, over 100 bunches being staged, and many of these of excellent quality. For six bunches, not less than three varieties, 1st, Mr. Goodacre, gr., Elvaston, with Gros Maroc, Gros Colmar, and Muscats; 2nd, Mr. Bannerman, gr. to Lord Bagot.

For three bunches of Black Grapes, there were eight exhibits; 1st, Mr. John Bates, gr. to T. J. Harris, Esq., Stone, with three bunches of Gros Colmar, weighing 14 lb., and well-finished off and fine; 2nd, Mr. S. Bremell, with very large bunches of Alicante, with smaller berries.

For three bunches of white Muscats: 1st, Right Hon. J. Chamberlain, M.P., with excellent bunches; 2nd, Mr. Goodacre. The other classes for Grapes were also well filled.

Apples and Pears, always well represented here, on this occasion were very numerous, and good in size and colour. For six dishes of culinary Apples, Mr. Goodacre was 1st, with a very fine lot; 2nd, Mr. W. Fisher, Bath.

For six dishes of dessert Apples—1st, Mr. Bannister, Westbury-on-Trym; 2nd, Mr. Goodacre.

For eight dishes of Pears, Mr. Austin was well 1st with a grand lot; enormous Beurré Diel, Glou Morcean, Zephyrine Gregoire, Durondeau, Bergamot d'Espere, Marie Louise, Easter Beurré, and Beurré Rance; 2nd, Mr. Bannister, with a fine lot.

Miscellaneous.—For Messrs. Thomson & Co.'s and Messrs. Pope & Sons special prizes for Primulas, some very fine plants were staged, and Mr. Jenkins carried off the 1st prizes in both cases with superb plants. Special prizes were offered for collections of vegetables by Messrs. Webb & Son, and there were a good number of exhibits. Messrs. Thomson & Co.'s special prizes for a collection of vegetables brought out sixteen exhibits, and they were generally fine. Mr. Robert Sydenham offered forty-eight prizes in different classes, and about 100 exhibits, the Leeds being especially noticeable, and the St. Valery Intermediate Carrots were very fine, clean, and well-shaped.

The Honorary Exhibits were of excellent quality generally, and Messrs. Perkins & Sons, Coventry, set up one of their pretty exhibits of decorative floral work. Messrs. Cutbush & Son, Highgate Nurseries, had a good display of Apples and Pears; Mr. Hy. Berwick, Sidmouth, Devon, a fine display of Apples and Pears; Mr. R. Owen, Maidenhead, several new Chrysanthemums.

Messrs. Hewett & Co. had some pretty shower bouquets, Mrs. Hodgkins of Manchester one of her pretty displays of botanical anatomy; and a Certificate of Merit was also awarded to Mr. C. H. Herbert, Manager of the Sparkhill Nurseries, for blooms of his Improved Marguerite Carnationa from seed sown in February last.

Two very fine honorary exhibits of vegetables were staged, both of them extensive and of first-class quality; one by Messrs. Thomson & Co., seedmen

Birmingham. The other by Mr. John Hughes, seedsman, Harborne, Birmingham, in which were very fine Lyons Leek and Onions of sorts.

The *Gardeners' Magazine* Silver Medal was unanimously awarded to F. Jenkins, Esq., Olton, near Birmingham, for his very fine Primulas, which took the 1st prizes.

SCOTTISH HORTICULTURAL ASSOCIATION.

NOVEMBER 16.—The Chrysanthemum and fruit exhibition of the Scottish Horticultural Association was opened on the above date in the Waverley Market, Edinburgh. The President stated at the opening proceedings that 30,000 people attended last year's show. There were 880 entries this year, against 855 last year, and 168 exhibitors against 153. The market seemed less furnished than usual, by the absence of several of the larger tables and other arrangements of plants on the floor. There were, nevertheless, some handsome exhibits, new in style and elegant in arrangement.

At the west end of the hall, Mr. Campbell of High Blantyre had a table of beautiful Carnations, forming a dense mass of flowers.

Conifers of the choicest species came from the nurseries of Messrs. Laird, and James Dickson & Sons, forming a broad sweeping lane at one end of the hall, and were artistically arranged with a front band of dwarf fine-foliaged shrubs. Close to these exhibits was a handsome table of well-grown foliage plants, interspersed with Heaths and other plants in flower; they were tabled by Messrs. Laird. The table of Mr. John Downie was of the most elaborate and novel description; wreaths, bouquets, and designs, in great variety of form, were an immense attraction. Great quantities of Violets, Roses, Roman Hyacinths, Cypripediums, Callas, Bonvardias, and Chrysanthemums were used in the arrangements, and dwarf foliaged plants dotted through the group prevented any appearance of stiffness. Close to this table was a remarkable display of dessert fruits, in which were some of the finest Pears in the show, the largest Gros Colmar Grapes, and two immense clusters of Musa Cavendishii; they were from Mr. Brown, Princes Street, and had 1st prize. The 2nd prize was awarded to Mr. D. Smith, Forest Road, for a splendid display of dwarf Palms, amongst which Asparagus was largely used for effect.

Mr. D. Fletcher's extensive stand of wire-trainers of every conceivable form, covered with Ivy and other climbers, were of great interest to many.

Messrs. Todd & Co., Edinburgh, had an extensive floral display of cut flowers and plants, including bouquets in many forms, made up of Orchids, Roses, Violets, Chrysanthemums, &c. Mr. Todd had a quantity of plants in pots for sale, the profits of which are to be handed over to the Gardeners' Orphan Fund.

An arrangement by Mr. Phillips of Golden Acres Nursery, of Vines, Araucarias, and Roses, appeared to advantage among the great breadths of gaudy flowers.

The Chrysanthemum plants in pots, for competition, were, as usual, arranged along the north and south sides of the hall. Mr. Cavanagh, gr. at Murrayfield, took the leading prizes easily; though his plants were tall they were well laden with finely-developed flowers. Some of the plants staged in this class were decidedly bad.

The large circular groups on the floor were arranged all along one side of the hall, with specimen Palms between each circle. These groups were very formal, but from their large size, and the abundance of flowers, they created a great show. Mr. Petrie, Westerlee; Mr. D. Holmes, Winton Castle; and Mr. Geo. Wood, Oswald Road, took leading prizes in these classes.

By the tables devoted to the classes for cut flowers the crowding was most inconvenient, and there were many criticisms of the judges' awards.

The chief trophy of the show was won by Mr. James Beisant, gr. at Castle Huntley. This was an elegant Silver Bowl, set on an ebony stand, and is the gift of the Corporation of Edinburgh, for the best forty-eight blooms of Japanese Chrysanthemums. All of the six stands in competition were of exceptional merit, Mrs. H. Cannell, Colonel Smith, Marie Hoste, Stanstead White, R. C. Kingston, Sunflower, W. H. Atkinson, and C. S. Shrimpton were noticeable. The 2nd prize was awarded to Mr. J. Machar, Broughty Ferry. He had in his exhibit Etoile de Lyon, Avalanche, Boule d'Or, Vivian Morel, and Stanstead White in extra

fine form. The 3rd prize went to Mr. William Rushton, Duntochar House, whose stand contained one of the best blooms in the show—F. S. Dibbens.

In the competition for the Scottish Challenge Cup the 1st prize was awarded to Mr. D. Nicol, Rossie Gardens, Forgandenny, who far out-distanced his opponents with one of the best exhibits. All his flowers were first-rate, Vicomtesse Hambleton, Stanstead White, Sunflower, W. Tricker, Louis Boehmer, J. S. Dibbens, F. A. Spaulding, M. Bernard, Mrs. W. E. Clarke, and Etoile de Lyon were remarkable. The 2nd prize went to Mr. J. Kyles, Gogar, who had flowers of fine form, but not so large as those of Mr. Nicol.

In the class for twenty-four Japanese, the 1st prize went to Mr. W. Rushton, his Mrs. E. W. Clarke and W. H. Lincoln were first-rate flowers; Mr. G. Price, Sunderland Hall, was 2nd for a capital exhibit.

In the nurserymen's classes the leading prizes were taken by Mr. H. J. Jones, Lewisham.

In the other twenty classes were some remarkably fine flowers, but some exhibits were weakened by irregularity in the size of blooms. Bouquets of Chrysanthemums were largely represented. Mr. Beisant, Castle Huntley, took the lead.

There were numerous exhibits of Cyclamens, Primulas, Cinerarias, Roman Hyacinths, table plants, &c., dividing the lines of Chrysanthemum stands, which relieved much of the monotonous appearance of the tables.

Messrs. T. Methven & Sons had a very telling table of choice cut blooms, set in pots of Ferns with excellent effect. Mr. Cavanagh had the Silver Medal for the finest pot-plant in the show; and the Bronze Medal for best incurred bloom went to Mr. Clarke. A Bronze Medal for the finest Japanese bloom went to Mr. Jones. The *Gardeners' Magazine* Medal was awarded to Mr. Cavanagh for the highest cultural skill.

Fruit.—Grapes were in some classes of high quality. Four bunches of Grapes from Mr. Leslie, Pitcullen Gardens, Perth, were awarded 1st prize, his Muscat of Alexandria was very fine; Gros Colmar, Lady Downes, and Alicante were also good in size and of excellent finish. Mr. Murray, Parkhall, made a capital 2nd; his Gros Colmar and Lady Downes were of beautiful colour.

Muscats were remarkable in the 1st prize exhibits for fine forms and size of berry, and excellent colour, and Mr. McNeil was the winner. Mr. J. Leslie, Pitcullen House, Perth, was 2nd. Black Alicante were first-rate, the best coming from Mr. Leslie. Mr. Murray was 1st for very fine Gros Colmar; Mr. Patterson, Avondale, 2nd; and Mr. Jeffrey, Harewood, Leeds, 3rd. The 1st prize for Lady Downes went to Mr. Murray; and the 2nd and 3rd to Mr. Leslie and Mr. Caldwell, in the order named. These were inferior to what we often see at Edinburgh. Mr. D. Kidd, Carbery Towers, showed Bowood Muscat, as any other Grape not mentioned in the schedule, but very unlike what we have often seen that variety. Mr. Rameay was placed 1st for two remarkably fine Cayenne Pines. Mr. McIntyre, The Glen, had a pair of good-sized fruits, very handsome in form, and was 2nd. The latter exhibitor brought twelve exhibits to the exhibition, and had prizes for each; he had a Vaada corulea with two spikes carrying 12 and 18 flowers respectively. The same exhibitor was 1st for a collection of thirteen dishes of fruit. Mr. Murray, Culzean Castle, was 2nd. For eighteen dishes, Mr. John Campbell, Singleton, South Wales, was 1st. Mère de Méoage, Alexander, Alfriston, Hawthornden, and Blenheim Orange, were of much excellence, clean and finely coloured. Mr. Day, Galloway House, showed well in this class for eighteen dishes of Apples and six of Pears. Mr. Wilson, Auchencruine, Ayr, made a capital display, Cellini, Stirling Castle, and King of Pippins were extra fine. His Pears were very good, Marie Louise, first-rate. Mr. Day had a good 2nd. Competition in all the classes was keen. Over 700 dishes of Apples and Pears were tabled, and no inferior fruits were exhibited.

Vegetables were never seen finer in Edinburgh at any season, and in all the classes the competition keen, Mr. Pender and Mr. McBean, Craighends Castle, Johnstone, were the principal competitors. Mr. Fender was the victor. There were some other fine collections in this class. For six sorts, Mr. Harper, Perth, was a capital 1st, and Mr. Waddie, Dollor, 2nd.

There were grand dishes of Tomatos, Leeks, roots of all sorts, Cauliflowers of great size, and in large numbers. Brussels Sprouts very fine (but exhibited in deep baskets, where there might be "toppers," giving much trouble to the judges), Cabbage, Curled Kale, Savoys, and Celery, covered long and wide tables.

STIRLING.

NOVEMBER 16.—The annual exhibition of the Stirling Chrysanthemum Association was opened in the public Hall on the above date. The show this year has been by far the finest exhibition the Society has ever held. The blooms were in first-rate condition, but the plants were indifferent. A group of plants, arranged for effect, shown by Mr. G. Virtue, was awarded 1st prize.

Mr. D. Ardrie, gardener, Larbert House, was 1st for thirty-six cut blooms, and received the Silver Cup. This exhibitor narrowly lost this prize last year.

For twelve blooms (Japanese), and twelve, ditto, incurred, the Gold Medal was won by Mr. A. Watt, Skellmorlie.

Mr. Ritchie, Polmaise, tabled fine Primulas; Mr. Lunt, Keir, Roman Hyacinths, Cyclamens, and six ornamental foliage-plants, &c.

In the classes for fruit, Mr. Lunt brought from Keir Gardens fine Grapes, black and white, taking the leading prizes in the various classes. Mr. Ritchie of Polmaise Gardens, took 1st honours with eighteen dishes of Apples, very fine for the Valley of the Forth.

Mr. Low, Viewforth, had 1st for the collection of vegetables. Amateurs put in a strong appearance in all the classes set apart for them.

WIMBLEDON.

NOVEMBER 14, 15.—A very bright show held on a wretchedly dull damp day, we found the spacious Drill Hall well-filled with fine groups, and the platform effectively decorated with foliage and flowering plants by that excellent local firm of florists, Messrs. D. S. Thompson, who had a large group of Chrysanthemums, zonal Pelargoniums, Roman Hyacinths, &c., attractively arranged. Of purely miscellaneous groups there were but two in competition. Mr. Chandler, gr. to Canon Haygarth, having the best, and the other came from H. S. Dean, Esq., The Priory. Both, however, suffered in face of the nine strong groups of Chrysanthemums that were staged, seven of these covering an area of 40 superficial feet, each being in the same competition. Here Mr. A. Newell, gr. to Sir E. Saunders, who had not so unduly packed his plants together as some others had, was 1st, although many of his front row plants needed some covering. Mrs. Falconer Jameson, Vivian Morel, Louis Boehmer, Etoile d'Yvon, M. Bernard, Avalanche, &c., comprised some of the best flowers. Mr. S. Mynett, Ashburton House Gardens, Putney, was 2nd with a very massive and close-packed group, overdone with white and yellow, and wearing a very formal aspect. Mr. Chandler was 3rd. In the smaller group class Mr. Hunt, gr. to R. C. Payne, Esq., was 1st, and Mr. Coleman, gr. to C. T. Giles, Esq., 2nd. Trained plants are not much encouraged here, single specimens only being invited. Mr. Thornton, gr. to J. E. Crocker, Esq., had in the Japanese Source d'Or, the best large-flowered, and Mr. Hunt the best Pompon in Sœur Melanie. Half a dozen grand double Primulas from Mr. Mease, gr. to A. Tate, Esq., Downside, Leatherhead, were an easy 1st; and the best single Primulas came from Mr. Newell. Mr. French, gr. to Mrs. Barclay, had the best berried plants in very finely grown and fruited giant yellow Capsicums. Others relying chiefly on the small-berried Solanums. Mr. Portbury, Rotherhampton, had the best six table plants.

Cut blooms were generally good, the leading class being for good money prizes, requiring twenty-four Japanese and twenty-four incurred; there were five competitors in this case, all good growers, and the first place fell to Mr. W. Higgs, gr. to J. B. Hanbury, Esq., Fetcham Park, who made such a striking figure last week at the Aquarium, Kingston, and elsewhere; and Mr. Mease was 2nd. The next class was for twelve blooms in each section, and here Mr. Mease was a good 1st with some fine blooms of chiefly new varieties; Mr. Carpenter was 2nd. With twelve incurred Mr. Jinks, gr. to W. M. Grant, Esq., Cobham, was 1st; Mr. F. Hopkins, gr. to Mrs. Woodderspon was next. Mr. Alderman was 1st, however, with the twelve Japanese, having capital clean flowers; Mr. A. Skeggs, gr. to Mrs. Bam, Wimbledon, being next. The latter had the best six incurred blooms; Mr. Wright, gr. to H. A. Tuffnell, Esq., having the best twelve bunches of Pompons; and Mr. Jinks the best six Anemones; whilst Mr. Mease had the best reflexed

Obituary.

ALEXANDER STEPHEN WILSON.—Readers of this journal will learn with regret of the death of Mr. A. S. Wilson, of North Kinmundy, Aberdeenshire, which took place in Aberdeen, on Thursday, 16th inst. The deceased gentleman, who combined in quite a remarkable manner, a zeal for botanical and agricultural experiments, was in the 67th year of his age. Trained to the profession of a civil engineer, Mr. Wilson took a prominent part in the construction of railways in the North of Scotland. On his marriage, however, with Miss Stephen, the proprietrix of North Kinmundy, deceased mainly directed his attention to botanical research. A recognised authority on botany and cryptogams, Mr. Wilson conducted a series of experiments with regard to ergot in grasses, and on one occasion he ate quantities of ergot to demonstrate that the ordinary notion that it was poisonous was fallacious. He also conducted a series of very valuable experiments with regard to the singling of Turnips, with a view to determine the most advantageous distribution of plants, so as to produce the greatest yield per acre. Mr. Wilson was an occasional contributor to this journal, and the author of several scientific and philosophical works, among these being *The Botany of Three Periods: Pharaoh's Dream, The Sower, and The King's Measure* (published in 1878); *The Unity of Matter*, and *Creation, the work of To-day*. His most eminent work, however, was *A Bushel of Corn*, which appeared in 1883. The preparation of this work—the conducting of the experiments on which the author's conclusions were based, the collection and marshalling of a marvellous array of facts and phenomena, and the compilation of very ingenious tables—occupied sixteen years; and the work was considered so thorough and valuable, that the Highland and Agricultural Society of Scotland presented its author with their Gold Medal. He was also possessed of a distinct poetical temperament. He published a volume of *Songs and Poems* in 1884, which embraced a series of very clever botanical poems, "The Ballad of Ocularian Zoophore," "Fungus-Hunting," and "A Mycological Serenade." A man of remarkable abilities in many ways, Mr. Wilson was peculiarly shy and reserved, and perhaps on that account his diversified work did not attain the popularity and recognition which its merits deserved. Full of kindly thoughts and feelings, and generous to a fault, Mr. Wilson made many friends.

MARKETS.

COVENT GARDEN, November 23.

[We cannot accept any editorial responsibility for the subsequent reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. ED.]

PRICES rule as last week.

POTATOS.

Trade and prices continue about the same as last reported, J. B. Thomas.

SEEDS.

LONDON: Nov. 21.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report to-day's market dull and uninteresting. Cables from America describe Red Clover seed as steady. For perennial Rye-grasses the tendency is downwards. No attention is given to Italian Rye-grass. Winter Vetches and Rye show no change. Kunzinger Tares are substantially dearer. Canary seed keeps strong; the demand is rapidly overtaking the supply. The new Hempseed now arriving being good and cheap, continues in favour. Wrinkled Seed Peas meet a brisk enquiry. Canadian Linseed is firm. For Peas and Haricots the sale is meagre.

FRUITS AND VEGETABLES.

BOROUGH: November 21.—Quotations:—Cabbages, 2s. 6d. to 4s.; Cauliflowers, 5s. to 6s.; Savoys, 3s. to 5s. per tally; Turnips, 1s. to 1s. 6d.; Carrots, 2s. to 3s.; Parsley, 2s. to 2s. 6d. per dozen bunches; Onions, 5s. to 6s. per bag; Apples, 1s. 3d. to 6s. per bushel.

SPITALFIELDS: November 21.—Quotations:—Cabbages, 2s. 6d. to 4s.; Savoys, 3s. to 5s.; Cauliflowers, 5s. to 7s. per tally; Turnips, 1s. to 1s. 6d.; Carrots, 2s. to 3s.; Parsley, 2s. to 2s. 6d. per dozen bunches; Onions, 5s. to 6s. per bag; do., English, 5s. 6d. to 6s. per cwt.; Apples, 1s. 3d. to 6s. per bushel.

STRATFORD: Nov. 21.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade has been done at the undermentioned prices:—Cabbages, 2s. to 3s. per tally; Savoys, 2s. to 4s. per tally; Greens, 1s. to 1s. 3d. per bag; Cauliflowers, 6d. to 1s. 3d. per dozen; do., 2s. 6d. to 6s. per tally; Turnips, 1s. 3d. to 1s. 6d. per dozen bunches; do, 2s. to 3s. per tou; Carrots, household, 40s. to 5 s. per ton; do., cattle-feeding, 28s. to 37s. 6d. per tou; Parsnips, 6d. to 1s. per score; Mangels, 2s. to 28s. per ton; Swedes, 20s. to 27s. 6d. per ton; Onions, English, 16s. to 170s. do.; do., Dutch, 5s. 9d. to 6s. 6d. per bag; do., Valencia, 6s. to 6s. 6d. per case; Apples, English, 2s. to 5s. per bushel; Brussels Sprouts, 1s. 3d. to 1s. 6d. per half-sieve; do., 2s. 3d. to 2s. 6d. per flat; Celery, 6d. to 10d. per roll; Horseradish, 1s. to 1s. 6d. per bundle.

FARRINGTON: Nov. 23.—Quotations: Cabbages, 6d. to 9d. per dozen; Cauliflowers, 1s. 6d. per dozen; Celery, 8d. to 9d. per roll; Sprouts, 1s. 3d. to 1s. 6d. per half-bushel; Onions, 6s. 6d. to 7s. per cwt.; Apples, Wellingtons, 3s. 6d. per bushel; Blenheim, 5s. per bushel; English Grapes, 1s. to 1s. 3d. per lb.; Sweetwater, 4d. to 6d. per lb.; Pears, Catillac, 2s. 6d. per basket.

POTATOS.

BOROUGH AND SPITALFIELDS: November 21.—Quotations ranged from 40s. to 110s. per ton.

STRATFORD: Nov. 21.—Quotations:—Magnums, dark-land, 35s. to 45s.; do., light-land, 45s. to 80s.; Imperators, 35s. to 55s.; Sutton's Abundance, 65s. to 70s. per ton.

FARRINGTON: Nov. 23.—Quotations:—Hebrons, 80s. to 10 s.; Regents, 50s. to 70s.; Snowdrops, 60s. to 80s.; Ma n Crop, 70s. to 90s.; Magnums, 40s. to 80s. per ton.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending November 18, and for the corresponding period last year:—1893: Wheat, 27s. 4d.; Barley, 29s. 2d.; Oats, 18s. 2d. 1892: Wheat, 27s. 11d.; Barley, 29s. 7d.; Oats, 18s.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 140s. to 155s.; new, do, 126s. to 145s.; inferior, do., 100s. to 120s.; Hay, best, 145s. to 170s.; inferior, do., 90s. to 100s.; new Mixture, 115s. to 130s.; and Straw, 35s. to 58s. per load.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr., for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

- 0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S.; Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending November 18, is furnished from the Meteorological Office:—

"The weather was fair at the commencement of the week, but soon became very unsettled, with heavy rain in the South of England on the 14th. The latter half of the period was exceedingly rough, severe gales being experienced in all districts, with heavy falls of rain in the west and north, and with snow in most parts of Great Britain as well as at some of the Irish stations.

"The temperature was below the mean in all districts excepting 'England, N.E.' the deficit being slight in most places, but amounting to as much as 4° in 'Scotland, N.' The highest readings were observed, as a rule, either on the 16th or 17th, when the thermometer exceeded 55° in most of the English districts, as well as in 'Ireland, S.' In 'England, E.' (at Cambridge), the maximum on the 17th was as high as 59°. The lowest readings occurred on the 14th or 15th, when sharp frost was reported in all districts excepting the 'Channel Islands.' In the 'Midland Counties,' and 'Ireland, N.,' the thermometer fell as low as 21°.

"The rainfall was in excess of the mean in all the wheat-producing districts, as well as in 'England, S.W.' and 'Ireland, N.' In 'Ireland, S.' and the 'Channel Islands,' however, the amount was about equal to the normal, while in 'Scotland, W.' and 'England, N.W.' there was a rather large deficiency.

"The bright sunshine was slightly in excess of the mean in the central and eastern parts of England, and also in Ireland and the 'Channel Islands.'

Elsewhere the amount was less than the normal, the deficiency being large in 'Scotland, E.' and 'England, S.W.' The percentage of possible duration ranged from 29 in 'England, E., and 26 in 'Ireland,' and the 'Channel Islands,' to only 8 in 'Scotland, N. and E.'

TRADE NOTICE.

THE Publisher will be glad to be placed in communication with anyone who has sent orders or remittances in response to an Advertisement "Bulbs for Sale," which appeared in our issue of October 14, 1893, from John Page, 25, Liverpool Street, King's Cross, W.C.

BRIAR ROSE SEED: *E. J. H.* The seed will not vegetate under two years; but instead of sowing it in beds and thus, perhaps, occupying valuable space for a long time, it would be better to mix the seed in a heap of sandy loam and let it remain till there are signs of germination, and then sow broadcast in beds and cover it about $\frac{1}{4}$ inch with sifted soil from the alleys.

CARNATION FUNGUS: *C. A.* Helminthosporium echinulatum, often figured and described in our columns. Burn all the affected plants

CARNATIONS: *J. S.* Ear-worms in the leaves. Burn all the affected plants.

CUTTINGS OF CHRYSANTHEMUMS: *Fond of Mums.* See an article by Mr. Douglas in our next issue.

ECHARIS: *A. C.* The additional number of parts is due to the union of two flowers in an early state. It is not uncommon, but of no advantage horticulturally.

GRUBS: *T. Kitley.* The grubs are those of the common "Swit" moth, *Heptalus humuli*. They will feed on the roots of almost any herbaceous plant. You might try a top-dressing of gas-lime, or some other insecticide. But a more effectual method, if it can be done without injury, would be to lift the plants, clear the roots and carefully hand-pick the grubs, and replant in fresh mould. The grubs are now about full grown, and will soon be passing into the pupa stage; some may have already done so. If the plants are in the open a few starlings would do more good in a morning than any insecticide. *R. McL.*

INSECTS: *W. M.* The grubs are those of a weevil, and are very destructive. Trap them with slices of Carrot or Potato.

LILY OF PALESTINE: *G. H.* We do not find the name in any list that we have been able to consult.

MANAGEMENT OF OUTDOOR NURSERY STOCK: *R. L. dings.* There is no book that will afford you just the kind of information you desire.

NAMES OF FRUIT: *W. Rowlands.* Mère de Ménage. — *W. S. A.* Blenheim Orange Pippin. — *W. Rolfe.* 1, King of Pippins; 2, Clissold Seedling; 3, Cornish Aromatic; 4, Cackle. — *J. Stubbs.* 1, Rymer; 2, Lucombe's Pine; 3, London Pippin; 4, Cackle Pippin; 5, Colonel Vaughan. — *Mr. Parker.* *Pitchcombe Vane.* 1, Beurré Diel; 2, overripe; 3, P. Colman; 4, Chaumontel; 5, Espérance; 6, unknown. — *R. Duthie.* 1, Unknown; 2, King of Pippins; 3, Scarlet Nonpareil; 4, Wiltshire Defiance; 5, Dumelow's Seedling; 6, Braddick's Nonpareil; 7, Golden Noble; 8, King of Pippins. — *C. E. M.* 1, Golden Noble; 2, Cox's Pomona; 3, Blenheim; 4, King of Pippins, very large; 5, King of Pippins, probably, but stalk wanting; 6, King of Pippins, true. — *Rev. T. W. S.* 1, Rymer Pippin; 4, Gloria Mundi; 6, Beauty of Kent; 7, Claygate Peamain; 8, Dutch Mignonne, others not known. — *G. T. C.* Apple Mank's Codlin. — *A. Morrison.* 1, Sturmer Pippin; 2, Cox's Pomona. — *O. Harvey.* 3, Hambledon Deux ans; 4, Fern's Pippin; 6, King of the Pippins, others unknown. — *John Tuck.* Your Pear is Vicar of Winkfield.

NAMES OF PLANTS: *H. F.* *Reineckia carnea.* — *C. J. D.* 1, *Croton variegatus*; 2, *C. cornutus.* — *A. J. Z.* (*in*

a Tin Box). 1, *Adiantum Mariessii*; 2, *Tradescantia variegata*; 3, *Bougainvillea glabra*; 4, *Cypripedium insigne*; 5, *Hibiscus rosa sinensis flore-pleno*; 6, next week; 7, *Selaginella Wildenovii*; 8, *Panicum variegatum*; 9, *Pentas carnea.* — *P. Read.* 1, *Begonia nitens*; 2, *B. nitida*; 3, *Begonia maculata hybrida*; 4, *B. Ingrami*; 5, *Laetrea opaca*; 6, *L. spinulosa*; 7, *Pteris hastata*; 8, *Aspidium vestitum*; 9, *A. aculeatum.* — *W. Robinson.* *Bulbophyllum hirtum.* — *J. R.* 1, *Cattleya labiata*; 2, *Odontoglossum crispum*, nothing extraordinary; 3, *Oncidium praeextum*; 4, *Calanthe Veitchii superba*; 5, probably a form of *Cypripedium barbatum.* — *T. W. Z., Leeds.* Your variety of *Cattleya Bowringiana* is an uncommon one. Light forms are not as a rule valued like the dark-tinted ones, but yours having a very brightly-coloured lip is certainly very attractive.

NEPENTHES: *Hortus.*—You may take the old plants out of the baskets in which they are growing, and cut away a portion of the lower part. Then prepare clean baskets with sphagnum moss, quite clean crocks, and some pieces of charcoal of the size of Walnuts, and a few knobs of fibry peat, letting all be well mixed together. Stick a plant, of course without any roots at the base, in the middle of the basket, and fill in around it with the compost, making the plant steady in some way. Afford a good watering, and hang the basket not far from the roof, in a moist hot-house. The young plants may be detached, and treated in the same manner, or they may be stuck into small perforated Orchid-pots. The warmer of your houses, that is the one with a night temperature of 65° at this season, would be the best. You may be rewarded by fertile seeds, we cannot say with certainty. *Nepenthes* are shy seeders, even when care has been taken to fertilise the flowers.

SWANLEY: *Critic.* The reports are furnished to us as an item of gardening news. We are not ourselves in a position to offer any opinion upon them.

PEAT OR MOSS LITTER USED IN STABLES AS A MULCH: *R. M.* Quite safe as a mulch, if laid on the soil 2 or 3 inches thick, but not so effective as a protection against frost as straw-litter, which has the advantage that it does not become compacted readily, and can be placed amongst the branches of dwarf Roses. On heavy land moss-litter forms, when dug in, a lightener of the staple, and as it has absorbed the ammonia from the urine, and contains the voidings of the horses, it is a rich manure. If the manure be not placed in large quantities together, there need be no fear that it will breed fungus when dug into the land.

TABLE DECORATIONS. We do not know of the book you name.

COMMUNICATIONS RECEIVED.—*R. C. B.*—*M. T.*—*B. W.*—*J. H.*—*T. H. Walker.*—*F. Q. C.*—*R. L.*—*W. C.*—*R. D.*—*H. M.*—*P. W.*—*A. Y.*—*Shirburn.*—*E. E.*—*J. H.*—*W. A. C.*—*A. S.*—*H. C. F.*—*W. DIED.—*Mr. James Bell,* gardener to His Grace the Duke of Wellington, at Strathfieldsaye, for twenty-eight years, died at Mortimer on Nov. 9, at the age of seventy-one years, and was buried on Monday, the 13th inst. at Strathfieldsaye. The deceased was an excellent gardener, and much respected by all who knew him.

— On the 21st inst., *JOHN WATERER* of Bagshot, Surrey, age 67. Funeral to take place at Bagshot, on Saturday, the 25th inst., at 3 o'clock.

CONTINUED INCREASE in the CIRCULATION of the "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

Increased to the extent of 75 per cent.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, and ALL CLASSES of GARDENERS and GARDEN-LOVERS at home, that it has a specially large FOREIGN and COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

WARE and SONS' ARE THE FLOWER POTS BEST.

FIXED.

THE IMPROVED GARDEN GULLY (VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are:—

8-in., 2s.; 10-in., 3s.; 12-in., 6s. 6d.

(The larger sizes are very strong for carriage drives.) Full Particulars and Testimonials on application.

VINCE & VINE,

58, Chester Road, Upper Holloway, London, N.

Laundries, Annexes, and Additional Accommodation to existing Dwelling Houses carried out.

Testimonial from HERBERT GREG, Esq.:—"September 13, 1893. I am pleased to say the work was done very well, and have no doubt it will be very comfortable when finished."

BOULTON & PAUL,
NORWICH.

CHARLES P. KINNELL & CO.,

IRONFOUNDERS, ENGINEERS, and BOILER-MAKERS.

ROCHFORD HORIZONTAL TUBULAR BOILER,

BOLTING TOGETHER WITH INDIA-RUBBER RING-JOINT, MANUFACTURED WITH FLOW AND RETURN SOCKETS IN ANY POSITION.

This Boiler has special advantages over any other of this type manufacture; the configuration of the centre casting divides the top connecting-pipe into two sections, gives increased waterway, and is removable without taking off back casting. No other Boiler has this advantage.

TERMINAL END AND CHAMBERED SADDLE BOILER.

VERY HIGHLY RECOMMENDED.

This Boiler is of the IMPROVED SADDLE FORM, is manufactured in Wrought Iron, welded; the back waterway, against which full force of the fire strikes, and the centre flue, make this one of the most economical Boilers extant. Made in all sizes, from 24 to 72 in. long.

CAST-IRON SADDLE BOILER,
 WITH WATER-WAY END and SIDE-FLUE OPENINGS.

The above is the best of all Boilers of the plain Saddle type. Made in all sizes, from 24 to 66 inches long.

SILVER MEDAL HORSE-SHOE BOILER,

The Best and Most Economical Amateurs' Boiler Manufactured.

Section of Boiler and Pipes, showing action of Hot Blast and Automatic Regulator. Awarded the SILVER MEDAL (FIRST PRIZE) by the Royal Horticultural Society in 1883; still stands without rival for—

Power, Efficiency, and Economy.

Patents 10,398.
 " 10,674.

NEW ILLUSTRATED LIST Now Ready.

IMPORTANT.

I RESPECTFULLY beg to inform all readers of this Paper that the first edition (100,000 copies) of my Revised PRICE LIST, consisting of 400 Pages and about 1200 Illustrations, bound in cloth, is Now Ready. I shall have much pleasure in forwarding, in due course, to every person who has applied for a Price List up to Oct. 23 of this year, on post-free; and to all persons until Nov. 26 sending Three Stamps for postage, after which the price will be One Shilling each, Post-free. This List is the most Complete in the trade, and has cost several thousand pounds to produce.

P.S.—Persons who have applied for a List at any time during the year, need not write again, as I have names and addresses, and one shall be sent in due course.

CONTENTS OF SECTIONS.

SECTION.	PAGES.
I. CONSERVATORIES GREENHOUSES, VINERIES, ORCHID HOUSES PLANT AND FORCING HOUSES, FRAMES, PITTS, HAND-LIGHTS, &c.	17-64
II. POULTRY, KENNEL, RABBIT, AND PIGEON APPLIANCES, &c.	65-98
III. RUSTIC WORK	99-134
IV. IRON BUILDINGS AND ROOFING, CHURCH FURNITURE, &c.	135-178
V. HEATING APPARATUS, COOKING STOVES, &c.	179-228
VI. HORTICULTURAL MANURES, FERTILIZERS, INSECTICIDES, WORM AND WEED DESTROYERS, SUNSHADES, SOILS, &c.	229-246
VII. LAWN MOWERS AND EDGE CUTTERS, TENNIS MARKERS, GARDEN ROLLERS, &c.	247-268
VIII. HORTICULTURAL TIMBER	269-280
IX. HORTICULTURAL SUNDRIES, WIREWORK, FOUNTAINS, VASES, STATUARY, &c.	281-342
X. VEGETABLE AND FLOWER SEEDS, PLANTS, LUTCH BULBS, &c.	343-383

WHY CAN W. COOPER SELL HIS GREENHOUSES, &c., CHEAPER THAN OTHER MAKERS?

I. Because he imports Timber in large quantities, and with the aid of special constructed machinery converts it into various shapes and sizes required for horticultural work himself on the premises, which no other horticultural builder is in a position to do. Can any timber merchant supply you with timber at anything near his prices? If any doubt, get estimates.

II. Because he imports Glass in large quantities, and has an agent who does nothing else but call on the manufacturers and buys up all parcels, large or small, at reasonable prices. Can any glass merchant supply you on better terms than him? If any doubt, get estimates.

III. Because he has an Iron Foundry in the iron district and casts nothing else but his own boilers and pipes all the year round, and by this means can sell cheaper than any other firms who go in for all kinds of castings. Can you buy a boiler or complete heating apparatus at anything near the price he quotes? If any doubt, get estimates.

You will see by the above that everything is bought direct in the cheapest market, thus saving middleman's profits, and not having to go to the timber merchant for the timber, the glass merchant for the glass, and the foundry for heating apparatus, like other horticultural builders. Buy of the Original Inventor of Cheap Greenhouses. Do not pay 5 or 6 profits, but one only.

AMATEUR GREENHOUSES. SPAN-ROOF.

Deduct 10 per cent. if required for brickwork.

THESE GREENHOUSES ARE MADE especially for Amateurs at a nominal figure, thereby coming within the reach of those who require a strong but inexpensive structure, and being constructed in complete sections, can be readily erected by any handy man or gardener in a few hours. The framework is substantially constructed of red deal, the lower part being filled in with good, sound, well-seasoned, tongued and grooved matchboards. The houses are fitted with door complete, with rim lock and brass furniture, painted or coat of good oil colour, supplied with all necessary iron-work and stages for each side, and good 16oz. glass throughout. All parts securely packed, and put on rail; or delivered, erected, and glazed complete, within twenty miles of London Bridge, at the prices mentioned on each side.

ILLUSTRATED LIST POST-FREE.

 All Timber consigned at the Cheap Timber Rate to all parts of the country. Send for TIMBER LIST.

"INVINCIBLE" HOT-WATER APPARATUS.

MOST EFFICIENT AND CHEAPEST IN EXISTENCE.
 Made in six sizes: No. 1, to drive 75ft., £1 15s.; No. 2, 10 ft., £1; No. 3, 200ft., £5 10s.; No. 4, 275ft., £7 10s.; No. 5, 375ft., £8 10s.; No. 6, 500ft., £10; of 4in. pipes.

Requires no sunk stovehole and no brick setting. Will last all night without attention. Will burn house-cinders, therefore costs next to nothing for fuel. Anyone can fix it. A child can stoke it. Success guaranteed. Cost of complete Apparatus for Greenhouses, with 4-inch pipes, flow and return along one side cut and fitted; so that if the internal measurement of the Greenhouse is given, the Apparatus will be sent completely ready for fixing, an advantage which will be appreciated by all. Securely and carefully packed on rail at the following respective prices:—7ft. by 5ft., £2 15s.; 9ft. by 6ft., £3; 10ft. by 7ft., £3 12ft. by 8ft., £3 5s.; 15ft. by 10ft., £1 5s.; 20ft. by 10ft., £5 5s.; 25ft. by 10ft., £6 5s.

MANURES, PEAT, SAND, FERTILIZERS, &c.

All sacks and bags free. Send for List, post-free.

THOMAS GREEN & SON, LTD.,

LEEDS and LONDON,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered

HOT-WATER BOILERS,

Others with TUBES, SHELVES, & HOLLOW or ORDINARY CAST-IRON GRATE BARS.

SADDLE BOILERS, With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant.

The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the FIRST and HIGHEST PRIZE—a SILVER MEDAL—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

MUNICIPAL PATTERN BOILER, THE BEST EXTANT.

The longitudinal section gives a view of the fire-box, water space, flues, &c. The cross section gives a view of the fire-box, water space and V-shaped back. The front elevation shows it set in brickwork, which is necessary for this class of boiler.

PAINTER and GLAZIER.—J. GREEN, who is just finishing the Vineries at Addington Park, will be glad to hear from any previous employer, or any Nurseryman or Gentleman's Gardener, who requires work done, or houses made sound for the winter. Any district. Own tools. Reasonable terms, or Low Estimate.—7, Beulah Grove, West Croydon.

WONDERS WILL NEVER CEASE, we are told; but it cannot be denied that Holloway's Pills are the greatest wonder of modern times. They correct bile, prevent flatulency, cleanse the liver, and purify the system, strengthen the stomach, increase the appetite, invigorate the nerves, promote health, and reanimate the weak to an ardour of feeling never before experienced. The sale of these Pills throughout the globe astonishes everybody, convincing the most sceptical that there is no medicine equal to Holloway's Pills for removing the complaints incidental to the human race. They are indeed a blessing to the afflicted, and a boon to those who suffer from disorders, internal or external. Thousands of persons have testified that by their use alone they have been restored to health after other remedies had proved unsuccessful.

TWO GRAND NEW PEAS

OFFERED FOR THE FIRST TIME BY

COOPER, TABER & CO., LMTD.,

90, SOUTHWARK STREET, LONDON, S.E.; AND WITHAM, ESSEX.

TABER'S "DUKE OF YORK."

This is the most distinct and valuable Pea that has been introduced for many years, as it combines earliness with good appearance and fine flavour; is of the most useful height both for market and private gardens, and in robustness of habit, size of pod, and productiveness will satisfy the most exacting. It may best be described as an earlier and dwarfer form of the "Duke of Albany," possessing all the good qualities of that standard variety, but maturing two or three weeks earlier, and producing an equally large crop on a plant growing to a height of only 3½ feet.

We submitted this Pea to the Royal Horticultural Society in 1892, and have much pleasure in stating that it was the only variety to which a *First-class Certificate* was awarded by the Fruit Committee in that year. The following is the Official Report:—"Royal Horticultural Society (Fruit Committee), July 7, 1892, W. WARREN, Esq., in the chair, and nine Members present. Award recommended. First-class Certificate to Pea 'Duke of York' (vote unanimous), from Messrs. COOPER, TABER & Co. An early selection of 'Duke of Albany.'"

The following notice of the same meeting appeared in the *Gardening World*, July 16, 1892:—"The Peas of the season." "Amongst the more pleasant of the functions which some few times in the course of the summer the working committees of the Royal Horticultural Society are called upon to undertake are the gatherings at the Chiswick Gardens, when flowers, fruit, and vegetables, old and new, are examined and awarded marks according to merit. Just recently the Fruit and Vegetable Committee met at Chiswick, to go over the Trial of Peas which is annually instituted there, with the unusual result that *only one new variety received an Award of Merit*. Taking 'Duke of Albany' as a standard of merit, the committee found it very difficult indeed to discover in other varieties qualities that excelled it. *The only one* was a dwarf form, if it may be so termed, of 'Duke of Albany,' as it is about 3½ feet in height, and is earlier than the taller form. This was, on the ground, not unfitly named 'Duke of York,' and we may add that it was sent for trial by Messrs. COOPER, TABER & Co., of Southwark Street, S.E."

Price, in Sealed Pints, 2s. 6d.; Half Pints, 1s. 6d.

TRADE PRICES ON APPLICATION.

COOPER'S "GOLIATH."

In the year 1886, we observed in a row of "Telegraph" Peas, growing in our trial grounds, one plant superior in every way to the others. The seed, when saved, was found to be unusually large and quite distinct. Since that time we have submitted it to repeated trials, and always with the same satisfactory results, added to which it has been uniformly true to character.

The height is about the same as that of the parent variety, but the plant is very much more robust, the pods are larger and more numerous, and the flavour equal to that of the finest wrinkled varieties.

We have therefore much pleasure in offering it, feeling assured that where Peas of fine quality are grown in large quantities for market, no better variety can possibly be found.

Price, in Sealed Pints, 2s. 6d.; in Half Pints, 1s. 6d.

TRADE PRICES ON APPLICATION.

THE ABOVE CAN BE OBTAINED FROM NURSERYMEN AND SEEDSMEN THROUGHOUT THE KINGDOM.

For other NOVELTIES and SPECIALTIES offered by us please see our NEW LIST, which will be forwarded, to the Trade only, post free, on application.

SMITH, London Fern Nurseries, Loughborough Junction, London, S.W.

SALE OF A LARGE and SPLENDID PRIVATE COLLECTION of ORCHIDS

BY THE

LIVERPOOL HORTICULTURAL COMPANY
(JOHN COWAN), LIMITED.

A LIVERPOOL GENTLEMAN has just purchased and placed in the hands of the Company, for Sale on commission, the entire well-known large and splendid Collection of Orchids, formed by E. G. Wrigley, Esq., of Victoria House, Dukinfield, near Manchester.

Mr. Wrigley's Collection is well known as one of the finest in this part of the country. The collection of DENDROBIUMS is certainly surpassed by few, if any, either in point of cultivation or variety. All the plants are in splendid health, and many of the finest varieties in cultivation are included, as well as some of the finest unflowered hybrids yet obtained.

The CATTLEYAS and LÆLIAS are also a grand lot, including many splendid specimens, and many rare and fine varieties. The CATTLEYA MOSSLE are a specially large and splendid lot; there are hundreds of fine specimens of this Cattleya alone, and all are clean, healthy, and vigorous.

The CYPRIPEDIUMS are a large and fine lot also, in splendid health, and include many of the finest hybrids, named and unnamed.

The ODONTOGLOSSUMS are also a fine lot, as are the ONCIDIUMS, CYMBIDIUMS, COELOGYNES, &c. In fact, the collection includes all the species and varieties usually found in first-rate collections.

Mr. Wrigley has given a great amount of personal attention to his Orchids, and has taken special care of the names and descriptions, which may with confidence be relied upon, and, in addition, they will be guaranteed by the gentleman for whom the Company is selling.

All the plants are models of good culture and cleanliness. Mr. Wrigley stated when the purchase was made, that not a single insect pest of any kind could be found on any Orchid in his Collection, and there is every reason to believe that his statement is correct.

Priced and Descriptive Catalogues are being prepared, and they will be posted to all the Company's patrons (and to any one who may send their name and address for the purpose), on Friday, December 8. All will be posted on the same day, and no purchaser will be permitted to see a Catalogue, or have prices quoted to him otherwise before that day; nor will any order be accepted for any plant or plants from the Collection. But from Monday, December 4, the Collection will be on view, and intending purchasers are invited to come or send to see it, and orders will be received from the date of sending out the Catalogues.

CATALOGUES, and any further information, may be obtained from the Company.

THE VINEYARD & NURSERIES,
GARSTON, NEAR LIVERPOOL.

The Royal Gardeners' Orphan Fund.

THE SIXTH ELECTION OF FIVE CHILDREN to the benefit of this Fund, consisting of an allowance of 5s. per week (subject to the conditions stated in Rule XIII.) will take place on FRIDAY, February 9 next, at the Cannon Street Hotel, London, E.C. All applications must be made on a proper printed form, copies of which may be had gratis of the Hon. Secretary, or any of the Local Secretaries. Such form must be correctly filled up, duly signed, and returned to this office not later than WEDNESDAY, December 27.

A. F. BARRON, Hon. Sec. Royal Horticultural Society's Gardens, Chiswick, S.W.

LAURELS and Variegated HOLLY CUTTINGS, best sorts. Price per 1000. No offer refused. HERBERT SHAW, Great Ayton, R.S.O.

It is issued in Royal Quarto, and the Text comprises English Botanical Description of the Plants figured, Notes on their Cultivation, and such general observations concerning them as may be likely to prove of interest or utility to Orchid growers. Price 5s. per part, or 60s. per Volume (12 parts), post free.

Vols. I. to IX. can be supplied, bound complete, with gilt edges, price £3 6s. each.

PUBLISHED BY B. S. WILLIAMS & SON, VICTORIA AND PARADISE NURSERIES, UPPER HOLLOWAY, LONDON, N.

NEW AND MAGNIFICENT

CYPRIPEDIUM CHARLESWORTHII

(ROLFE, N. SP.)

Exhibited and unanimously awarded a First-class Certificate by the Orchid Committee of the Royal Horticultural Society, and pronounced by every one to be the most beautiful and charming Cypripedium introduced, causing quite a sensation at the Drill Hall, on Tuesday, September 26, 1893.

The special feature of this novelty is the dorsal sepal, which is quite distinct in appearance and colour to any other known Cypripedium, which will render it exceptionally valuable to the hybridist.

The Gardeners' Chronicle says:—"There was a more than usually interesting show of Orchids, but by far the most novel and beautiful exhibit was a plant of Cypripedium Charlesworthii, Rolfe, n. sp., First-class Certificate, an entirely new species, imported by Messrs. Charlesworth, Shuttleworth & Co., Heaton, Bradford, and exhibited by them for the first time, the exhibit coming in for a great amount of attention and admiration. The plant in growth somewhat resembles C. Spicerianum, and the flowers, which are borne on scapes about 3 inches in height, are unlike any other known species. The beautiful flat, upper sepal is 2 1/2 inches wide, broadly orbicular, white, tinged, and veined over its surface with light rosy-purple; the apex alone showing a white marbling. The lower sepals are about 1 inch broad, greenish-white. The petals, which resemble those of C. insigne, are plain-edged, over 1 1/2 inch long, yellowish, tinged with brown; the lip also somewhat resembles that of the Sylhet form of C. insigne, and is similar in colour to the petals. The staminode is very singular, resembling pure white porcelain, the protuberance in the centre being conical in form, and not a single spur, as in C. insigne. It is an extraordinary and beautiful species."

be compared with any that we can call to mind. The plant is of dwarf habit, the flowers each having a remarkably fine dorsal sepal, extra large, measuring about 2 1/2 inches each way; the colour a pale pink, suffused with purple, and having a lighter network towards the extremities; the petals are shaded with greenish-brown, so also is the pouch, which is rather small. A greater novelty amongst the species of the Slipper family has not been seen for a long time. From Messrs. Charlesworth, Shuttleworth & Co., Heaton, Bradford.

The Journal of Horticulture says:—"A very remarkable introduction from the East Indies; it is a distinct and beautiful species, very dwarf, with long narrow leaves. The flower stem is only 3 to 4 inches long; the lip is short, green, heavily suffused with bronzy-brown, and the dorsal sepal is very noteworthy—it is broad and rounded, and the colouring is a beautiful soft rose, delicately veined; the staminode is pure white. A feature of the leafage are the rows of dots on the reverse side. The species is a great acquisition (First-class Certificate)."

The Gardening World says:—"An interesting collection of Orchids was exhibited by Messrs. Charlesworth, Shuttleworth & Co., Heaton, Bradford, including a handsome new species, named Cypripedium Charlesworthii, from the East Indies."

The Garden says:—"A First-class Certificate awarded to Cypripedium Charlesworthii, Rolfe, a distinct and decidedly novel species, which cannot be offering this great novelty, we beg to state that we are the sole importers of this plant. We shall be very pleased to quote size, price, and full particulars. Inspection cordially invited.

CHARLESWORTH, SHUTTLEWORTH & CO., Wilmer Road, HEATON, BRADFORD.

THE COLORADO BLUE SPRUCE.

ABIES PUNGENS GLAUCA and ARGENTEA.

ALL AFTER OUR SEEDS.

ALL AFTER OUR SEEDS.

THE HIGHEST HONOUR A GARDENER CAN ATTAIN.

H. CANNELL & SONS offer to Gentle-

men's Gardeners a valuable MONEY PRIZE, together with a brilliant STAR OF HONOUR, for the best collection of Vegetables, Fruit, and Flowers, to be competed for during the coming season. This Order of Decoration will be worn as an incentive to the best productions and accomplished gardening, and will be valued and appreciated as an heirloom.

H. CANNELL & SONS' CHAMPION SASH

TO AMATEUR & COTTAGE GARDENERS' SOCIETIES.

We also offer a valuable MONEY PRIZE, together with a splendid GOLD-LETTERED SASH, for the Best Collection of Twelve Dishes of Vegetables, Fruits, and Flowers.

In neither offer do we bind those competing to purchase of us, but simply mention as a fact the superiority of our own grown Kentish Seeds brought us last year 2000 more orders than the previous one. New customers find them more productive, better crops, and require less quantity than those they have been accustomed to. We rely on our friends and our

TRADE

MARK.

and those showing preference for our firm. See Illustrations and full particulars in SEED CATALOGUE, which will be issued shortly.

Societies wishing to take up our offers, should communicate with us at once.

THOMAS GREEN & SON, LTD.,
LEEDS and LONDON,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered

HOT-WATER BOILERS,

Others with TUBES, SHELVES, & HOLLOW or ORDINARY CAST-IRON GRATE BARS.

SADDLE BOILERS, With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant.

The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the **FIRST and HIGHEST PRIZE—a SILVER MEDAL**—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

MUNICIPAL PATTERN BOILER, THE BEST EXTANT.

The longitudinal section gives a view of the fire-box, water space, flues, &c. The cross section gives a view of the fire-box, water space and V-shaped back. The front elevation shows it set in brickwork, which is necessary for this class of boiler.

SIZES AND PRICES.

M B 1	3 ft. 2 in. long by 2 ft. 0 in. wide by 2 ft. 0 in. deep	} Calculated to heat 1-in. piping as follows:—	1000 ft.	Price £15 0 0

The Guernsey Set of Japanese Chrysanthemums

The finest ever offered in one set, three of the varieties being Certificated this autumn by the National Chrysanthemum Society. All leading growers who have seen them, confirm the Chrysanthemum specialist's opinion (Mr. E. Beckett, Aldenham House (Gardens, Elstree) that they are without doubt the most superb Exhibition varieties ever produced. They were raised in Guernsey, and grown and exhibited by Mr. E. Beckett.

VIOLETTA (First-class Certificate National Chrysanthemum Society, October 24, 1893).—A very fine deeply-built flower, deep drooping petals, very distinct form, colour soft rosy-violet; a most attractive flower upon the exhibition board; it also shows up remarkably well in a collection of plants. Price 5/- each.
For further particulars, see the *Gardeners' Chronicle*, October 28, 1893, p. 537; *The Garden*, Oct. 28, 1893, p. 405; *The Journal of Horticulture*, Nov. 2, 1893, p. 402.

COLONEL CHASE (First-class Certificate National Chrysanthemum Society, November 8, 1893).—A wonderful-sized Japanese variety, most distinct in form, a perfect flower, long drooping florets, colour pale blush, with centre shaded yellow. Price 5/- each.
For further particulars, see *The Journal of Horticulture*, November 16, 1893, p. 415; *The Garden*, November 11, 1893, p. 450.

CECIL WRAY (awarded First-class Certificate at the Floral Meeting of the National Chrysanthemum Society, on November 22, 1893).—It is the very finest yellow Japanese that has ever been exhibited. A pure canary-yellow, of an exceedingly fine form, very strong, and very free habit; retains its foliage to the pot. Price 5/- each.

UNDINE.—A fine creamy-white, of excellent form; very strong grower, and a most refined flower. Price 3/6 each.

EDELWEISS.—A charming pure white, of exquisite form; broad petals, good substance. A glorious exhibition flower. Price 3/6 each.

ENID DOBREE.—A bright fiery red, with yellow reverse; fine bold flower, perfectly formed, and very distinct. Price 2/6 each.

The Set of Six Varieties, 24/-. As the Stock is limited, Orders should be sent at once.

SPECIAL PRIZES will be offered for Flowers of this Set, at various Exhibitions in the Autumn. Particulars will be published shortly.

For all other NOVELTIES of CHRYSANTHEMUMS, see CATALOGUE, which may be had post-free upon application.

FRANCIS RAVENS CROFT, Manager.

CHARLES P. KINNELL & CO.,

IRONFOUNDERS, ENGINEERS, and BOILER-MAKERS.

ROCHFORD HORIZONTAL TUBULAR BOILER,

BOLTING TOGETHER WITH INDIA-RUBBER RING-JOINT,
MANUFACTURED WITH FLOW AND RETURN
SOCKETS IN ANY POSITION.

This Boiler has special advantages over any other of this type manufacture; the configuration of the centre casting divides the top connecting-pipe into two sections, gives increased waterway, and is removable without taking off back casting. No other Boiler has this a vantage.

TERMINAL END AND CHAMBERED SADDLE BOILER. VERY HIGHLY RECOMMENDED.

This Boiler is of the IMPROVED SADDLE FORM, is manufactured in Wrought Iron, welded; the back waterway, against which full force of the fire strikes, and the centre flue, make this one of the most economical Boilers extant. Made in all sizes, from 24 to 72 in. long.

CAST-IRON SADDLE BOILER, WITH WATER-WAY END and SIDE-FLUE OPENINGS.

The above is the best of all Boilers of the plain Saddle type. Made in all sizes, from 24 to 66 inches long.

SILVER MEDAL HORSE-SHOE BOILER,

The Best and Most Economical Amateurs' Boiler Manufactured.

Section of Boiler and Pipes, showing action of Hot Blast and Automatic Regulator. Awarded the SILVER MEDAL (FIRST PRIZE) by the Royal Horticultural Society in 1892; still stands without rival for—

Power, Efficiency, and Economy.

Patents 10,598.

10,674.

Holding one of the largest stocks of H. W. Boilers, Pipes, and Fittings, in the Kingdom, we are able to execute Orders of any magnitude from London War-houses, or to despatch direct from Works without delay. To meet the requirements of our increasing business, we have recently added No. 65, Southwark Street to our London premises, and have now the largest and finest Show-rooms in our Trade in the Kingdom. Price List illustrating all types of Boilers, Valves, Pipes, Ventilating Gear, and all classes of Horticultural Appliances free on application.

65 and 65a, SOUTHWARK STREET, LONDON, S.E.; also Branches at GUERNSEY and JERSEY, for CHANNEL ISLANDS.

GARLIES MITCHELL, Nurseryman, Stranraer.

NEW BORDER CARNATIONS.

MADAME DE FALBE.—Clear yellow, full flower, and perfect pod; stands well in the open border, the flowers remaining in good condition during weather that quite destroys the beauty of Germanias. I was awarded 2nd Prize in Mr. Martin Smith's competition, at the National Show, Chiswick, although, owing to the very early season, the finest flowers had all been cut.

SOLENT QUEEN.—A seedling from Mrs. Reynolds Hole, possessing all the good qualities of that variety, with a perfect pod; colour deep yellow, flaked and striped with bright rose. This variety, unnamed, was in my 1st Prize Collection, at Earl's Court, 1892.

Very strong plants, 1s. 3d. each; 12s. per doz. Post-free, cash.

CARNATION CATALOGUE on application.

EDWARD C. GORLE, F.R.H.S., M.N.C.S., Walcot Nursery, R/de, Isle of Wight.

A STERLING NOVELTY FOR 1894. NEW LOBELIA.

ELECTROS 3/6 EACH.

LOBELIA, BARNARD'S PERPETUAL.

This splendid novelty (of which Mr. Wm. Bull has bought the entire stock), is, without doubt, the finest Lobelia yet raised. The flowers are of the most brilliant ultramarine blue, strikingly ornamented with a pure white marking at the base of each of the two lower petals. It is of compact habit, and alike useful for bedding or growing in pots, while the bright and effective colouring of its flowers, combined with its perpetual-blooming character, make it extremely effective either for beds or ribbon borders.

Price, 1s. 6d. per packet.

- .. GOLDEN WEEPING } fine heads.

Knap Hill Nursery, Woking, Surrey.

fine, but white in colour, being a cultivated variety; they have not at all reverted to the parent wild form, either in colour or size; a few only were just beginning to ripen."

Drimys Winteri (Winter's Bark Tree) and *Libertia formosa* were seen in flower, and *Myrtles* were seen, as also the curious shrub or tree-like Composite, *Dendroseris*, sp., with long, straggling branches, and Dandelion-like foliage, exuding a milky juice when ont or broken. A solitary Palm—*Juania australis*—was sacrificed for its young-growing point, or "Cabbage," which is white in colour, being naturally blanched, and delicate in flavour, "somewhat like a fresh Filbert." So much for the botany of Juan Fernandez, but the description of the *Gunnera* is in one or two respects worth re-examination, for while the illustration might represent either *G. manicata* or *G. scabra* fairly well, the name, and also the description, implies a species quite distinct from either the one or the other. Thus, "the huge circular leaves" . . . "catch and hold a large quantity of rain-water," shows clearly that there is no sinus in the leaf-base, but that the leaves are really peltate, forming natural water-bowls or leafy tazzas, that Selkirk may have found useful in dry seasons! Be this as it may, *Gunnera peltata* is evidently a plant to be desired in our gardens, if it could be introduced by means of seed or otherwise. But the same is true of many other botanical rarities mentioned in these pithy volumes, such as the Kergulen Cabbage for example (*Pringlea antiscorbatica*), of which fine photographic plates are also given. Two other species of *Gunnera* are noted as being found on Selkirk's Island, viz., *G. bracteata* and *G. insularis*, but we are not told of their size or character.

A common species of *Gunnera* in Chili is *G. chilensis*, Lamarck, found chiefly on sandstone cliffs, and sides of ravines and valleys, from Caracas to Patagonia. Of this species, according to Baron Von Mueller (*Select Extra-Tropical Plants*, edition 1881, p. 154), Darwin measured leaves 8 feet in diameter, and 24 feet in circumference. The young acidulous leaf-stalks serve as a vegetable, like Rhubarb, and the thick roots are used for tanning and dyeing. *G. scabra* is known as "Panque," or "Panke," in Chili. *G. macrophylla*, of Blume, grows in Java and Sumatra on mountains as high as an altitude of 6000 feet.

To return to the *Gunneras*, it would be interesting to know more about them all, and especially of this remarkable *G. peltata* of the *Challenger* record, of which preserved specimens were doubtless obtained. It may possibly be quite distinct from the plant Darwin saw in Chili, as also from the giant species of Patagonia. It has always seemed to me a great oversight, that a good gardener or horticultural collector was not included on the staff of the *Challenger* survey, since from his exertions a good harvest of living plants and seeds might, doubtless, have been obtained. Private enterprise in collecting yields very excellent results in its way, but only plants popular and saleable at home, are, as a rule, sought for or obtained. This is especially true if we search the annals of nurserymen who have employed collectors abroad. At one epoch, it is Ferns or succulent plants, then Cape Heaths and Pelargoniums, or Indian Rhododendra, that claim attention; or again Hardwooded plants of Australia, and the Conifera of America, but for the past quarter of a century Orchids have practically absorbed all attention. Hardy plants generally are now becoming so popular, however, that we may soon

look to their being sought after in all temperate and cool regions with more assiduity and pecuniary success. Who can guess what treasures still exist in Siberia or in northern China, or in the Caucasus, or alongside the great Russian highway to Herat? Then there are the mountains of Siam, Cochin China, and Thibet, the very "roof of the world," as it has been called, still awaiting the collector of hardy and half-hardy vegetation. Even in such easily-traversed countries as Chili and Peru, there yet linger many remarkable half-hardy plants of known beauty, that are still unknown to our gardens here at home, and the same is true of extensive districts in Japan, and gigantic chains of the Himalayas, with their unknown treasures of *Lilium*, or of *Rhododendron* and *Magnolia*.

We now live in an epoch of very remarkable liberality of feeling and thought, and one, moreover, of the broadest phases of culture. There is a welcome and a purchasing public awaiting new or rare plants of whatever kind in England and America to-day. We find people paying two or three guineas for a *Narcissus*, or a choice Lily bulb, as readily as for an Orchid, and so widely diffused and deeply-rooted is the love of all hardy flowers, that the wonder is the professional collectors of them for trade purposes are so few and far between. *F. W. Burbidge*.

NEW OR NOTEWORTHY PLANTS.

CYPRIPEDIUM × HERMIONE, *n. gard. hybr.*
(*Spicerianum* ♀, *barbatum* Warneri ♂).

ALTHOUGH belonging to a section tolerably well-defined, this is a distinct variety, its general appearance, and especially its low stature, placing it nearer *C. × Maynardi* (*Spicerianum* × *purpuratum*), than to any of the other hybrids in which *Spicerianum* has been crossed with varieties of *C. barbatum*. The leaves are very pale green with a light tracery of dark green; the flower-stems about 6 inches in height. The beautiful pure white upper sepal of the flower is nearly 2½ inches broad by 1½ inch long; and it has a bright green base, a purple line up the centre, and shaded rose-purple veining extending over the basal half. The horizontally extended petals are greenish-white with a rose-coloured tinge and some lines of chocolate dots at their bases. The lip greenish-white tinged on the face with reddish-brown; the lower sepal whitish with green lines. It flowered with Reginald Young, Esq., Fringilla, Linnet Lane, Sefton Park, Liverpool. *James O'Brien*.

ACIDANTHERA EQUINOCTIALIS.

Plants of this interesting Irid are now flowering in one of the stoves at Kew. They are from corms sent to Kew by Mr. Scott Elliott last March, for whom they had been collected in Sierra Leone by Captain H. M. Donovan, who wrote:—"I have forwarded to you a bundle of bulbs of the *Iris* (?) you found at the top of Sugar Loaf at Sierra Leone. You seemed interested in them, and when up there I brought down a lot. I dried them in the sun as well as I could, and hope some will grow." Mr. Scott Elliott notes that he found this plant growing "in crevices of bare gneiss rocks in open spaces in the bush almost at the summit of the Sugar Loaf, 3000 feet alt." Previous to this our only knowledge of this *Acidantha*, according to Mr. Baker, was from an unpublished figure by Dean Herbert in the Lindley library. It is possible that Herbert had the plant in cultivation. The Kew plants are like *Gladolus Gandavensis* in corm, stem, and foliage, the stem measuring 4 feet in height, and the leaves 20 inches by 1½ inch. The dried specimens collected by Captain Donovan were 3½ feet high. The flowers are borne in a loose spike, six being the highest number shown so far. The spathe-valves are green, 3 inches long, folded over the flower-tube, which is slender, curved, and

6 inches long; the limb is composed of six equal lanceolate segments, forming a regular stellate expansion, 3 inches across when fully open, snow-white, with a broad streak of crimson at the base of each segment; the three stamens and three-branched style stand erect in the centre of the flower. In a cool-house this plant was not so happy as it has been since it received tropical treatment. It is placed next to *A. bicolor* by Mr. Baker, which is a native of the mountains of Abyssinia, and is the only species hitherto known as a garden-plant. It has stems 2 feet high, with white flowers nearly as large as those of *A. equinoctialis*. This species is a favourite garden-plant in New York, where it is grown in tubs out-of-doors in summer. There are seventeen species of *Acidantha*, all of them African. *W. W.*

KEW NOTES.

DIOSPYROS KAKI.—This, the Japanese Persimmon or Date Plum, does not often fruit in English gardens, so that the plant in the succulent-house (No. 5) at Kew, which has this year borne five fine fruits, has been something of a novelty. One of the fruits is still on the plant, although they were all ripe and of the richest orange colour six weeks ago. They are about the same size and shape as an ordinary Orange or large Peach. The plant is a grafted one, obtained from a French nursery three years ago, is now 6 feet high, and not unlike a healthy Bush-Apple. It gets the same treatment as an ordinary fruit-tree, i.e., pruning, manuring, watering, &c., the only difference being in the shelter afforded by the glass. I see no reason why it should not be grown and fruited annually in a sunny greenhouse. It must have plenty of sun. In the south of France and Italy it is not an uncommon tree, and when in fruit it has all the attractiveness of a well-cropped Apple of the Baldwin stamp. In Japan it is largely cultivated, and there are about fifty named varieties of it, the fruit varying considerably in size and form, and in colour from pale yellow to blood-red. The Japan Agricultural Society, Tokio, issues a descriptive Catalogue of forty-two varieties, and a coloured sheet representing forty-five varieties, with cultural directions. This is a fruit which might be introduced into many parts of India and the colonies. It would be quite at home along with Peaches, and probably would stand almost tropical treatment. *W. W.* [The plant has, on more than one occasion, been figured in our columns, from English-grown specimens. Ed.]

CYDONIAS.

THE Japanese Quinces are among the most showy and continuous-flowering shrubs. The species I wish to draw attention to is the *Cydonia japonica* and its varieties, frequently spoken of as *Pyrus japonica*. It was introduced to this country in 1815, and soon became an immense favourite. This fact is proved by the frequency with which it is met in old gardens, either large or small. Producing a grand display of blossoms early in the spring, and continuing more or less in bloom throughout the summer, this species of Quince well deserves its popularity. It seems almost equally at home in any soil or position, but is generally seen in what I venture to say is one of the least suitable places it could occupy; i.e., on low walls. To see the full beauty of this shrub it should be allowed to grow at will, and the finest examples I have seen were on a lawn. This type has brilliant scarlet flowers, many of which are produced before the foliage becomes general, and are continued until the whole plant is in full leaf. Very few shrubs are more striking early in the spring than this *Cydonia*. The varieties are of cream, blush, and rose colour; there also are double and scarlet forms. As a hedge plant, where somewhat loose growth can be allowed, few subjects are more suitable, while its stiff growth and formidable thorns make it almost as impregnable as the best-kept hedges. *A. P.* [On the

Continent, *Pyrus japonica* is frequently observed clipped to a spreading cushion-like mass of from 2 to 5 feet in diameter and 1 to 3 feet high, and in this form it is a most striking object when in bloom, scarcely a leaf being seen, only its scarlet blossoms. As a clipped hedge it is also good. The pruning or shearing is done after blooming. ED.]

THE SPECIES OF PHŒNIX.

NOTWITHSTANDING the now numerous works which treat on the natural order of Palms, and the many pamphlets on the different genera, there still appears to be as great a diversity of opinion as ever, and, furthermore, there appears to be no uniformity in the matters of nomenclature amongst the present works. Up to the present date the genus *Phoenix* has proved one of the greatest problems to botanists; nor can it be wondered at when, both under cultivation and in the wild state, when growing in close proximity to other species, they are almost sure to fertilise one with the other, and in this way an endless number of varieties has been produced which deviate more or less from the parent plants, and in some cases assume characters so distinct as almost to entitle them to specific names.

In plants grown under glass the variation is not so evident as when growing in the open air in their native habitat, or as we have them in the Riviera gardens, flowering and fruiting in abundance, and assuming all the various forms which so puzzle the connoisseurs when they visit our gardens, and from whom there is no definition to be obtained with regard to their nomenclature. It seems a pity that now most of the *Phœnix* in the Riviera gardens have attained maturity; or at least, are in every way characteristic, that they are not resorted to for scientific purposes, but *au contraire*, very little is known of them, and the flowers and fruits which they produce annually are wasted, at least from a botanical point of view.

Taking the *P. reclinata* section as an example, I find that the varieties of this species, if it is a species, are more confusing even than the Date Palm, and it is a difficult matter to distinguish the true one amongst the many varieties which exist. At the Villa Valetta garden at Cannes there is a very fine group of this section all massed together, and amongst them there are not two which answer to the same description, and some of them are very distinct in character. For my part, I consider *Phoenix reclinata* a mere variety of *P. spinosa*, and it is evident that some system will have to be followed in this way before they can be classified. I myself have, after consulting most of the chief authors, concluded that the following is the safest plan to adopt, and from which the many varieties may be classified:—

- Phoenix spinosa* (typica), the ordinary plant with yellow petioles.
 „ „ var. *reclinata*, much recurved, and short thick spines.
 „ „ „ *cycadæfolia*.
 „ „ „ *paradisia*.
 „ „ „ *argentea*, &c.

There are also many other varieties, as *P. pumila*, *P. zanzibarensis*, &c., which belong to this section. As to *P. spinosa* there are one or two points which seem quite clear. The plant is known from Abyssinia to Durban, and on the other coast from the Cape to Senegambia, and is to be occasionally met with inland, such as at the great lakes. Owing to its great geographical distribution the plant shows great variations, in the habit, foliage, colour of the petioles and spines, the white and brown covering of the young fronds, and in various other ways.

It appears to have been originally named by Jacquin as *P. reclinata* in 1807, two years later it was named *P. spinosa* by Thonning, and a little later again was named *P. leonensis* by Loddigea after Leone, one of the early collectors at the Cape.

Sir John Kirk in one of his pamphlets on East Tropical Africa writes:—“*Phoenix spinosa*, common over the central region of the continent and on the sea-coast, sometimes as a bush, is a tree with a

flexuose stem 20 feet in height. The green bunches of fruit immersed in water for twelve hours suddenly assume a scarlet hue, and the astringent pulp becomes sweet.” The latter remark I have satisfactorily proved to be the case.

Again in *P. dactylifera* there is an endless number of varieties, and we find that in Egypt there are over a hundred varieties in cultivation. It has been said that the Arabs, to perpetuate their stock for fruiting purposes, take only the offsets, as they cannot be relied upon from seed! In any case it is a practical method, as offsets grow fruit much more freely than plants raised from seed.

P. sylvestris I should certainly class as belonging to the *P. dactylifera* section, and it is moreover probably the wild species of the date.

P. canariensis appears to be of hybrid origin, and the two progenitors of all the Riviera plants are said to be the two magnificent specimens in Baron Vigier's garden at Nice. If this be the case, it is not to be wondered at that there is difficulty amongst the *Phœnix*, considering the many varieties of this species which may be seen in the Riviera gardens.

P. paludosa probably exists in the Riviera gardens, but I have not yet met with the true one. I was informed by a gardener awhile ago that he had the true one, but on examining the fruit, I discovered that it was possibly a hybrid between that and another species, as the embryo of the seed was inclined to one end, whilst *P. paludosa* appears to be the only one which has the embryo at the base of the seed.

Amongst the *P. humilis* there is to be found an endless variety, some of them being very distinct.

Beccari in “*Malesia*” treats on the genus *Phoenix* at some length, but I cannot entirely agree with him with regard to the last-named species, and it seems evident that he, like most others, finds this genus a very confusing one to deal with. The hybrid *Phoenix* mentioned by Mr. Naudin (p. 299), is probably an acquisition as a fruit, but there is also an hybrid between *P. canariensis* and *P. dactylifera*, which exists in gardens here, and which ripens its fruits regularly, and is of a delicious flavour. *Riviera*.

CHILIAN STRAWBERRIES.

THE mention in the narrative of the *Voyage of the Challenger*, of “most excellent Strawberries,” as “growing wild,” is interesting, but if they have really been introduced as is later on implied, when we are told that they are “white in colour, being a cultivated variety,” then surely they are simply “naturalised,” rather than really “wild.” Possibly there may be good evidence of the white Strawberries of Juan Fernandez having been introduced from the mainland of Chili; *F. chiliensis*, with whitish or rose-coloured fruits, being abundant there, and well known as the source from which our old race of “Chilian” Strawberries were derived, the typical species having been introduced to Franca in 1727 and largely grown in the neighbourhood of Brest as lately as 1837. This old white or pale rosy semi-dioecious Strawberry was largely grown in America before the advent of newer seedling varieties, and is still cultivated at the Strawberry-beds near the *Phoenix Park*, Dublin, as noted by Barnett, in *Trans. Hort. Soc.*, vol. vi., p. 194, as long ago as the year 1826. *F. W. B.*

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT CHELTENHAM.

IN Mr. Cypher's nursery, the varieties of *Dendrobium Phalaenopsis Schroderianum*, though now on the wane, are almost as beautiful as ever. Two very distinct types have appeared in several specimens, viz., the type with white sepals, and dark crimson petals and lip, and the type denominated “delicatum,” in which the flowers are white, tinged with bright rose over the outer halves of the segments.

D. P. Statterianum, *D. bigibbum*, and *D. superbiens*, all belonging to a class which thrive admirably, are also making a good show.

Varieties of *Cypripedium* × *Leeanum*, *C. × Sedeni*, *C. Spicerianum*, and the numerous forms of *C. insigne*, are also good. Two extra-fine forms of *Masdevallia balla* and *M. Chimæra*, numerous light scarlet *Sophrontis*, several of the fragrant *Trichosma suavis*, and other good things, are in bloom, and the plants in every instance in excellent health.

PHALAENOPSIS APHRODITE VAR. OLORIOSA.

The form of the plant known in gardens as *P. amabilis*, imported by Messrs. Hugh Low & Co. in 1888, and named by Professor Reichenbach *P. gloriosa*, preserves its distinct character, but evidently only as a variety of *P. Aphrodite*, the variety of which species, named *Dayana*, it rather closely approaches. It has very clear white flowers, with bright crimson markings at the base of the lip. It is finely in flower with R. Brooman-White Esq., at Ardarrloch, Garelochhead, N.B.

CYPRIPEDIUM (SELENIPEDIUM) × SCHRODERIA.

A fine plant of the best variety of this stately hybrid, obtained by crossing *C. caudatum* and *C. × Sedeni*, is now in bloom in the gardens belonging to F. C. Jacob, Esq., at Cheam Park, Cheam. Its flowers are almost entirely of a rich dark magenta-crimson, the unfolded side-lobes of the pouch being blush-white, with crimson spots. It is certainly one of the handsomest varieties of the now numerous hybrids of the *C. × Sedeni* class.

CYPRIPEDIUM × TENNYSON (G. NANTHUM SUPERBUM ♀, DAYANUM ♂).

As is often the case in flowering a batch of hybrid *Cypripedium*, the first to flower and be described in this case was very inferior to the varieties which flowered subsequently. The best which has yet appeared is now in flower in McArthur's Nursery, Maida Vale, from whence the plant is being distributed. Its flat, perfectly circular upper sepal, displays a fine clear white margin, and the whole flower is more brightly tinted than the original.

ORCHIDS AT WALTON GRANGE.

The proprietor of Walton Grange, W. Thompson, Esq., is a well-known Orchid amateur, of nearly a quarter of a century standing, who has devoted much of his spare time to the cultivation of cool-house Orchids, principally *Odontoglossums*, and with him originated the unique *O. crispum* Thompsonii, which is in its way as magnificent a variety as *O. c. Rothchildianum*, *O. c. apiatum*, or *O. c. Mundyanum*, these three being probably the gems of the first water in the Alexandræ section of *Odontoglossums*. In addition to this, there are many other fine things in the way of *Odontoglossums*; for instance, *O. Stevensii*, named after Mr. Thompson's able gardener; *O. fastuosum*, a perfect gem, entirely covered with round spots of a deep rosy hue, and named by the late Professor Reichenbach; as well as many other interesting species and varieties of *Odontoglossums*. Mr. Stevens is the envied possessor of many chatty letters from that distinguished Orchid luminary, which make interesting reading for those who ever happened to meet him, or read his numerous descriptions in past years in these columns.

It would be hard to find a collection of *Odontoglossums* where almost every procurable species or variety is so well represented and cultivated as in this one, for in it are to be found the grandest varieties, down to the meekest and lowliest spidery forms. Although Mr. Stevens has been a very successful cultivator in years past, he has recently been fired with an ambition to excel his former achievements; this is owing to a visit which he paid in the spring to some of the Belgian establishments, where he studied closely the methods and practices of Orchid growers, and bore away much useful information. It is a matter of fact, that nearly, if not all, the *Odontoglossums* have been turned out of their former compost, and material similar to that in vogue in Belgium has taken its place, with the result that

Mr. Stevens is gradually reaching that goal for which he has been striving. The collection does not, however, comprise cool Orchids only, as, during the last year or two, attention has been given to Cattleyas, Lælias, Dendrobiums; and a few weeks ago, when I saw the collection, there was a fine display of flowers. Principal among these must be mentioned a superb strain of the indispensable Cattleya labiata vera, the range of variety being marvellous, some being almost of uniform colour, while others have pale sepals and petals, with very dark labellums; a few have the appearance of Cattleyas gigas, with a prominent white eye on either side of the throat. When I noticed these plants 100 or more flowers were expanded, and about 100 plants had still to unfold their flower-buds. Grouped with this lovely species were about a dozen very fine plants of Dendrobium Phalaenopsis Schroderianum, one plant in particular bearing five magnificent spikes of almost pure white flowers. This variety, called Walton Grange variety, is of great value; another distinct form, in which pure white and dark crimson are combined, is named Miss Katie Thompson. Lælia tenebrosa, Walton Grange variety, recently Certificated, and figured in these columns, August 19, fig. 42, is another gem of this collection, and will shortly be in flower again. Here may be seen many nice plants of rare varieties, such as Cattleya intermedia alba, C. Wagnerii, Lælia Perrinii alba, the latter one of the most chaste white Orchids known, and existing only in its true form in two other collections in this country—that of Baron Schroder, and Mr. Measures of Streatham. *Viator*.

ORCHIDS AT SELWOOD, ROIMEHAM.

Selwood is the residence of G. D. Owen, Esq., who is an enthusiastic Orchid amateur, as may be judged when it is stated that five or six years ago he scarcely possessed a plant, and now he has seven or eight houses filled with some of the choicest varieties and best types in each section of this popular family. On the occasion of a recent visit, and had I seen nothing but the Cattleya labiata alba (true) and C. Hardyana, Selwood variety, I should have been amply repaid and gratified, as these are, without doubt, superb Orchids. They were exhibited at the Royal Horticultural Society's meeting on October 24 last, and deservedly received an Award of Merit. The following were also in flower at the time of my visit, eighteen plants of Cattleya labiata, all varying more or less in coloration and size of the flowers, and all of the best type: Cattleya Aclandiae, Linden's var.; C. aurea, some with very large and richly-coloured lips; C. gigas, very fine; C. Rex, also very good; and Lælia marginata. L. Perrinii was represented by some half-dozen plants, all of which are very good varieties; a plant of Cœlogyne Massangeana was carrying two spikes, with twenty-two flowers each, and two other spikes were showing for bloom; Dendrobium chrysanthum and D. Dearei were good, the latter especially being strong, healthy, and well-flowered; Lycaste Skinneri, L. plana, L. aromatica, Odontoglossum Roezlii album, Oncidium varicosum Rogersii, O. ornithorhynchum, O. Kramerianum, Sophronitis grandiflora. Amongst those not in flower, I noticed the following:—Cattleya exoniensis, C. Massiana, C. aurea, C. gigas Sanderiana, C. gigas imperialis, C. Schroderae, C. Backhouseiana, C. Reineckiana, C. Rex, C. Victoria Regina, &c. Amongst the Lælias are L. autumnalis alba, L. Gouldiana, L. anceps Sanderiana, L. præstans alba, L. purpurata Princess May, L. grandis tenebrosa, L. Schroderiana, L. Backhouseiana, &c. The collection of Dendrobiums contain some rare species. D. nobile Cooksoni, D. nobile nobilium, D. Phalaenopsis Schroderianum, D. Owenianum, which received a First-class Certificate from the Royal Horticultural Society, 1893; Venus, and many hybrids, &c. There are several good plants of Lycaste Skinneri alba, one of which had, I am told, eighteen flowers on it last year. Odontoglossum are in strong force, and are remarkably healthy; O. Edwardi, with flower-spike 5 feet long;

O. Cervantesii, O. Harryana, O. bastilabium, O. Phalaenopsis. O. crispum is in large numbers and best types, O. Wattianum, which received a First-class Certificate at the Manchester show last Whitsuntide; and many others are amongst them. Nearly the whole genus is represented, but time would not admit of my making note of them. Although the district is a smoky one, and heavy fogs very prevalent during the winter, every plant is in the best possible state of health, which does credit to the skilful management of Mr. Watts, the head gardener. *J. H.*

ORCHIDS AT FLANLEY LODGE.

The small town garden belonging to F. S. Moseley, Esq. (gardener, Mr. W. Jones), in the Avenue Road, Regent's Park, has an interesting collection of Orchids, which produce a fair amount of flowers at all seasons of the year. Among the species recently in bloom were a fine plant of Cypripedium × Swinburnei, with several large flowers; C. callosum, C. × Reginaldianum, C. × Pallas, C. Spicerianum, various forms of C. insigne, C. × Harrisianum, several good Oncidium Forbesii, and O. prætextum; Dendrobium Phalaenopsis Schroderianum and D. bigibbum, Cyperorchis elegans and C. Maerianii, a fine form of Odontoglossum Uro-Skinnerii, good pans of Pleione Wallichiana and P. maculata, various forms of Cattleya labiata, Cataeum macrocarpum, Maxillaria picta, Lælia anceps, L. autumnalis, Cœlogyne Massangeana, and different kinds of Calanthe. Also, among other interesting plants, Anthurium Andreanum and Aristolochia gigas Sturtevantii—a noteworthy display for a London garden in the end of November.

PHALAENOPSIS INTERMEDIA VAR. PORTEI.

This plant is a supposed natural hybrid between P. Aphrodite and P. rosea. Sepals pure white, petals much larger, pure white, with a few minute specks at the base. Lip three-lobed, lateral lobes violet, with a few crimson spots and dots; central lobe ovate, deep crimson, with the point separated into two short tendrils. Crest at the junction of the lobes of the lip nearly square, depressed in the middle, deep yellow, with crimson dots. *Reichenbachia*, t. 68 (2).

DIBDIN HOUSE COLLECTION OF ORCHIDS.

The pretty gardens of Fred. G. Tantz, Esq., at Ealing, if they cannot boast such a number of houses as that which contained his famed collection at Studley House, Shepherd's Bush, can at least demonstrate that the love of Orchids is as strong as ever in their owner, and the power to cultivate them as great in his gardener, Mr. J. C. Cowley, as it was when more space was devoted to these plants in the gardens at Studley House, on leaving which Mr. Tantz dispersed his collection, except a few favourites and the young hybrids which were retained to form the nucleus of what may some day be as important a collection of Orchids as that previously got together by Mr. Tantz. But few houses at Dibdin House, at present, contain Orchids, but these are one and all as full of bright and good flowers as anyone could wish, while among the hybrid Cypripediums there are a few really superb things in bloom. In the first division of a lean-to range containing many showy flowers of the varieties of Cattleya labiata, together with spikes of Vanda cœrulea, are some remarkably fine Lælia pumila præstans, well-bloomed Dendrobium formosum giganteum, &c. Among other Cypripediums a most beautiful new hybrid is in flower. The parentage has not been recorded, but there is little doubt that it was obtained by crossing one of the noble forms of C. insigne of the C. i. violaceo-punctatum section, for which the Tantz collection was famed, with their equally famous C. Boxalli, which had so much white in the upper sepal. The plant in question has rather broad green leaves, the stout scape is twin-flowered, the flower now open having a fine upper sepal in which the basal-half is bright green spotted with purple, the upper half pure white with some bright purple spots on the portion above the green base. The broad

petals are yellow with a purplish tinge; the lip yellow, with a shining dark red face; the lower sepal, which is as broad as and longer than the lip, is greenish-white with a few chocolate spots. The whole flower is fine in form and superb in colour. Another hybrid of unrecorded parentage is a fine thing, which may be C. superbiana × Curtisii. It has the large lip of C. Curtisii, and broad petals curved downward, and somewhat resembling those of C. × Morgania. Many hybrid Cypripediums which flower at Dibdin House, if they are not thought to be really good and distinct from anything else previously named, are simply put under the name of the nearest thing they resemble, with the addition of a × to imply that it was home-raised. But many among these would get distinguishing names in other places, and some of them would be worthy. One specially pretty flower marked C. Harrisianum ×, had flowers tinted over the greater part of their surface with that bright rose-crimson seen in C. × cœnanthum. Flourishing well are the two plants of that magnificent hybrid C. × Cowleyanum, and in bloom are a great variety of C. × Leeannum, C. Spicerianum, C. Hookera ×, C. insigne × callosum, very distinct, though not showy; C. callosum, C. niveum album, and many other species and hybrids. On the raised staging at the front of the house are thousands of seedling hybrid Cypripediums of all sizes, and as such rare things as C. Fairrieanum and all the best varieties of the species which vary, have been used to obtain them, some beautiful and unique things must result. In the next division there is a good show of Cattleya labiata, Vanda cœrulea, Epidendrum Godseffianum, Sophronitis grandiflora, Cypripediums, &c., and a cool house at the end of the range of vinerias is almost filled with varieties of Cypripedium insigne, chiefly small plants acquired out of recent importations. There is endless variety among them, and some of the plants are quite distinct from the old type. Among them are a few of the favourites brought from Studley House, and of these C. insigne Cowleyanum and C. i. Studleyense are the most beautiful and dissimilar. The former has flowers in which the yellow is very bright, and the light brown spotting in the upper sepal very evenly and closely arranged; while in the latter the spots are very large and comparatively few in number, both having a good expanse of pure white at the tip of the dorsal sepal. Orchids are in most of the other houses in more or less quantity. In the Peach-house there was a good show of Chrysanthemums. Outdoors a new Rose garden is in the course of making near the pretty rock garden, with its summerhouse on high ground, and rustic walk and bridge over the bog garden.

FRUIT REGISTER.

PEAR, WINTER NELIS.

This valuable Pear in use at this season has never, so far as I know, been of finer flavour nor so large. I have always thought highly of Winter Nelis as a dessert fruit at the end of the year. Our best specimens were taken from a tree growing on a west wall, and those from the east wall were not so good. Of late years the fruits of this variety has ripened prematurely and cracked, but this season none has cracked; and there is very little trace of rust. From this it may be inferred that a warm position is the most suitable for the trees. I have noticed that the blooms of Winter Nelis are more liable to injury from frost than some others; but when it escapes frost, the bloom sets so heavily that severe thinning becomes necessary. *W. A. Cook, Compton Bassett.*

CORNISH GILLIFLOWER APPLE.

This choice winter Apple should be in every garden, although many growers complain that it has been a shy bearer. It really is better for not being pruned, and the finest crop which I ever saw was on some trees which had never been pruned. *G. Maers, Marazion.*

PRIMULA FORBESII.

OUR illustration (fig. 106) shows the annual Primrose exhibited at a recent meeting of the Royal Horticultural Society by Mr. Bain, gr. to Sir Trevor Lawrence, Bart., the President. It was found in Yunnan, in the interior of China, by the Abbé Delavay, and was first described by M. Franchet, in 1886, in the *Bulletin de la Société Botanique de France*. It

FIG. 106.—PRIMULA FORBESII—ANNUAL PRIMROSE: FLOWERS LILAC.

HARD-WOOD GREENHOUSE PLANTS.

(Continued from p. 690.)

APHELEXIS AND PHENOCOMAS.—These two genera may be dealt with as one, although in some respect their cultivation differs, but being nearly related, and carrying similar everlasting flowers, it is found desirable to treat of their cultivation at the same

larly the case with *Aphelexis macrantha purpurea*, which is disposed to make longer growths than any other kind. To train such a plant with the shoots erect is to make it appear ridiculous in the eyes of a good plantsman. In such a case the training should be performed by entwining the shoots around the sticks so as to shorten the height. In doing this the central part of the plant should be left free of any entanglement, so as to give plenty of room for the young shoots to make good progress; these issue freely from the base of every healthy example, and as they progress the older and weakened ones which may possibly have attained to 3 or 4 feet in length, can be removed as may be found necessary. *Aphelexis macrantha rosea*, on the other hand, is a much dwarfer plant and more compact in habit. The best variety of this is comparatively scarce. It is the same as that known as Bruce's variety, which was shown before the Royal Horticultural Society, when known as the "London Horticultural Society," in 1843, and under the name of *A. sesamoides rosea*. This variety has the largest flowers of any, with shorter footstalks, being the nearest to self-supporting of any of the genus. A quarter of a century ago, or somewhat more, it used to be shown at southern shows by Mr. Thomas Gilbert of Hastings, and by Mr. Samuel Hudson, of Horsted Place. Mr. Baines also had it in his collection, and Mr. Chilman, another well-known old plantsman.

Of late years it has been but little seen. I noted it, however, as small plants in Messrs. Hugh Low & Sons' exhibit at the Temple Show two years back. It would be a great pity if it were lost to commerce, being, as it is, by far the most showy variety of any. There is another form which passes under the name of *A. macrantha rosea*, but it has smaller flowers, rather deeper in colour—perhaps the growth is not so compact. This, I consider, is identical with *A. humilis*. Another excellent variety is *A. purpurea grandiflora*, which has large flowers, being intermediate in this respect between *A. macrantha purpurea* (dark purple) and *A. macrantha rosea*; it has somewhat the long straggling growth of *A. m. purpurea*. I noted a fine plant this year at the Crystal Palace May-show in excellent form. There is also a white variety, but the three named are decidedly the best varieties. *A. ericoides*, the white variety, is of dwarfer growth than this one, with smaller flowers. Every collection of hard-wooded greenhouse plants should at least possess *A. macrantha rosea* and *A. purpurea grandiflora*.

Considering the showy character of these plants, it is in a measure surprising that they are not grown more extensively. They last a long time in fresh condition after the flowers are expanded, whilst for a month previous the buds as they develop make no mean show. It is also interesting to watch their progress from the time of first showing colour. It may be thought preposterous to recommend them for cutting purposes, but I do so without the slightest hesitation.

Each flower may be taken with a good length of stem, from 8 to 10 inches, or even more, without any injury. One fact in *Aphelexis* culture is not generally known, as it bears on the cutting of the flowers. When they are cut, more often than not the stems of the flowers are taken short with the idea of not robbing the plant of any of its wood, the popular place of incision being just where the leaf-growth ceases, and the scales which protected the flowers in their earliest stages first appear. This is done under the notion that a fresh shoot will start from this point, but this is not so; the portion of woody growth left will die back to the next shoot below it, that one being already in an advanced stage. To leave this part, therefore, is useless, for it will have to be removed eventually; the better plan is to take it off with the flower attached, each one will break out easily enough at the base of the growing shoot. I have seen specimens myself in which these pieces of dead wood had been left, all to a useless purpose, making the plants look shabby and stubby. When the flowers are specially required for drying purposes, than which there is nothing better in the whole range of "everlasting" flowers, they should

is mentioned in the *Report of the Primula Conference*, and was first exhibited in London in December, 1891, by MM. Vilmorin, Andrieux et Cie. The figure gives a good notion of the appearance of the plant. The pale lilac flowers are pretty, and arranged in whorls, the flowers in the lower whorls being expanded simultaneously with those in the upper. The habit is rather weedy, as is the case with so many annuals when cultivated. An annual Primrose is almost unique in the genus. A coloured figure is given in the *Bot. Mag.*, t. 7246.

time. *Aphelexis* is a genus of plants introduced from the Cape of Good Hope at various times between 1739 and the early part of this century. The species are, speaking generally, of a scandent growth rather than bushy. This is so much the case that they always need the support of sticks. This is probably the reason why they are not seen more frequently as small decorative plants; whilst in some gardens where tying has been followed, it has been but a poor attempt, an indication of what to avoid rather than what to practice. This is more particu-

be cut (or broken out), whilst the disc of each flower still possesses its rich golden colour. This colour will not, it is true, be fully retained, but its brightness, as compared with that of stale flowers when cut, will be decidedly advantageous. From the time the flowers begin to expand, every care must be taken not to wet them, nor should the plants then be kept in a moist atmosphere, otherwise their beauty will be quickly spoiled. A light house with no shade at all, save to prolong the freshness of the blooms when fully expanded, is the best place for them. The flowers do not open kindly during a dull or damp day, then of course no shading should be used. I have staged plants myself specimens in full flower, during a dull day, with the blooms only partially open, but after an hour's sunshine the effect would be quite different with each blossom fully expanded.

As to potting and soil, the treatment is very similar to that of hard-wooded Cape Heaths. The potting must be done in a firm substantial manner, exercising caution against excessive shifts. When arrived at specimen size, a plant, if potted well in good peat, will continue for several years in a healthy state, with the usual proviso of careful watering. The peat I prefer, is that in which the Heather thrives. This is usually thin, dark in colour, handling hard and wiry. A good addition thereto is charcoal, in pieces of the size of horse beans, or failing that, some crocks broken up fine, the object being to guard against injury to the roots by over-watering. The roots of an *Aphelexis* are delicate, more so even than those of the *Ericas*; hence this caution. Silver sand should be freely used, more so than in hard-wooded plants generally. The best time for potting is after flowering; when in warm and sunny situations the plants can stand out-of-doors or in pits, where the lights can be drawn over in case of rain. In watering, nothing beyond clear water should be used at any time.

Phœnocomma prolifera and its variety *Barnesii* are both fitting companions to the *Aphelexis*. The former flower is the earlier of the two, but the latter has the brighter-coloured blossoms. As to potting and soil, the same course should be followed, but the *Phœnocommas* will, on the whole, take more water, being of more dense and bushy growth. Starting with a young plant, pinching should be persisted in for a season or two to form a good base, and at any future time when a shoot is seen to be taking the lead. Thus a dense specimen can be formed which will be almost self-supporting. The flowers are not supported on such foot-stalks as the *Aphelexis*, fresh growths often pushing forth close up to the blooms. Sufficient wood should be taken when each flower is cut to keep the plants compact. The *Phœnocomma* forms an excellent succession to the *Aphelexis*, lasting well into August. Insects I have never known to be troublesome, but I can imagine that the mealy-bug on the *Phœnocomma* would be a nuisance. Of parasites the only probable source of harm is from mildew in damp weather during the dull season of the year. Propagation is from cuttings only, and should be proceeded with early in the spring, but as root-action in this case is rather slow some considerable care and patience is necessary to ensure a successful strike. The temperature of an ordinary greenhouse will suit both, but overcrowding should be studiously avoided, the plants being kept as near to the glass as possible. H.

VEGETABLES.

SEAKALE PLANTING.

Roots of Seakale will be lifted pretty generally in gardens during the present and next month, and thogs prepared for planting sets to be put out at once into well manured, trenched soil; or laid with the right end upwards in boxes or beds of loamy soil in the open and covered with a little litter to exclude frost, planting them in the spring. Seakale being usually grown in lines for forcing in Mushroom houses and other places, it needs little to be said about this method, beyond stating the distance

between the sets, which may be 9 inches to 1 foot in the rows, and 2 feet between the latter. Where Seakale is forced in the ground by means of pots and manure, beds and alleys each of 4 feet wide may be pegged out, and two lines of clumps planted on each bed. The clump should consist of three sets each, put in a triangle, having a side of 9 inches or 1 foot, the distance depending on the size of the pots that will be used to cover them. The clumps should be 2 feet apart each way. It is a plan that cannot be recommended for small gardens, or those which have not a large supply of leaves, stable manure, and a good staff of gardeners. O. O.

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By B. WADDS, Gardener, Birdsall Gardens, York.

SWEET-SCENTED CAPE PELARGONIUMS.—These plants, if they are to be kept in good condition for winter cutting, a purpose for which they have no equal, should have careful attention paid to the watering, or the leaves will assume a yellow colour, and drop. It is best, therefore, to keep them on the dry side, and to see that the drainage is in good order. Shift the position of the pots, and clean the plants often, affording abundance of air, with a small amount of fire-heat in dull or cold weather, and keep them in a clean condition by fumigation. A temperature of 45° by night, and 50° to 60° by day, suits them. The best varieties for cutting purposes are *Citriodorum crispum*, *Lady Scarborough*, and the large Oak-leaved varieties.

HERBACEOUS CALCEOLARIAS.—Seedlings raised in August and grown on in 60's should be ready for a shift into 5 or 6-inch pots, which had best be performed before the pots become full of roots, and before the plants are drawn in any way. The foliage at this stage ought to be strong, and of a good dark green colour. The best soil for them is a rich loam and well-rotted leaf-mould, used in about equal parts, and rotted dry cow or sheep-dung, with plenty of rough sand. The drainage should be ample, moss or dry cow-dung being placed on the crocks; the plants must not be dry when potted. Place them in a cool airy house, on a shelf or table where they can be shaded from bright sunshine; water them carefully, and keep green-fly from them, but avoid fumigating the plants in a very young state, as they are often injured by so doing, rather dipping them in, or syringing them with, *Quassia*-water. A temperature of about 40° by night and 45° to 50° by day will suit them, and they should be kept as near to the roof-glass as possible, affording plenty of space between the plants, and air abundantly.

GREENHOUSE, HARDWOODED, AND NEW HOLLAND PLANTS.—The present is a good time to train and clean the stock of *Azalea indica* plants, and any of the early-flowering varieties that may be well set with forward buds, such as *A. amena*, *A. Deutsche Perle*, *A. Reine des Roses*, and *A. Raphael* may be placed in the forcing or other warm house. Great care will be required in watering large specimens of *Azaleas* at this season, and before everything, see that the drainage of the pots is in order; and as a guide to watering try the weight of the pots at times, a rap with the knuckles not being always a good test of the state of the soil. When watering is done it should be thorough. Allow the yellow foliage to fall without pulling it, a gentle shaking when watering them may be given to bring down the leaves. If troubled with thrips, fumigation may be done now without injury. Air must be admitted during mild weather freely, the temperature of the house ranging from 40° to 45° by night, 50° by day. The collection of *Ericas* and *Epacris* should be well looked after, the drainage of the pots examined, and watering done with thoroughness when water is needed. At this season mildew is troublesome, and sulphur should be applied as it is noticed. The staking and training of such species and varieties that require it should be proceeded with, using deal sticks green painted. *Erica intermedia*, *E. hyemalis*, and *E. autumnalis*, are most useful plants for winter decorative purposes, and they can be easily brought into flower in a warm-house, lasting a long time in good condition in a cool-house. The temperature of the *Erica*-house should now range from 40° by night, to 45° or 50° by day. Ventilate well during fine weather, but avoid admitting cold, frosty air. Hard-wooded plants, such as *Acrophyllum venosum*, *Aphelexis macrantha*, *A. purpurea*, *Boronia*, *Darwinia*, *Acrophyllum gracile*, *Diosma*, *Monochætum ensiferum*, *Phœno-*

coma prolifera, *P. Barnesii*, *Pimeleas*, *Tremandra verticillata*, &c., should be thoroughly examined, and the shoots trained. These plants will require much care in watering at this season, and the best positions should be given to all the choice specimens, elevating them on pots above the surrounding plants, and as near to the roof-glass as may be. As regards air, it should be afforded almost as freely as to Heaths. The floors of hard-wooded plant- and *Erica*-houses should be kept dry, mopping up the water after each watering of the plants, which is an operation that should never be done after mid-day. The hot-water apparatus may be used on dull days, with much air on, and advantage taken of bright days to thoroughly air the house. The temperatures mentioned for *Azaleas* will suit these plants.

THE ORCHID HOUSES.

By W. HOLMES, Gardener, Pickering Lodge, Timperley.

SEASONABLE HINTS.—The weather during November having been trying to Orchids generally, and the occurrence this year of sharp frosts and cold rough weather have caused much artificial heat to be made use of, together with but a small amount of ventilation. Careful watching will therefore be especially necessary with *Odontoglossum crispum* and *O. vexillarium*, these being more or less subject to being infested with injurious insects. If the yellow thrips make their appearance, dip the plants in an insecticide, but do not fumigate them with tobacco, these soft-leaved plants suffering more from it than from the insects themselves. The best and safest substance, and one that I use generally, is a weak mixture of Fir-tree oil. The use of the thanatophore covers the leaves with dew, which, getting into the axils, and finding its way into the hiding-places of thrips, is very effective, doing no harm whatever to the plants, and is clean and safe in use. In dipping Orchids, the roots get wetted with the substance used and are killed, together with the sphagnum moss, and as sure as the latter decays so does the plant. The usual cleaning of the houses may now be carried out, cleanliness in Orchid culture being one of the chief points. The glass, woodwork stages, &c., should be washed with hot soap-suds, and the walls limewashed. After using soap-suds, rinsing with clean water is always necessary so far as the glass is concerned. The pots and pans should be made clean outside, and re-arranged. Follow this by sponging the leaves of the plants carefully, especially be careful with the *Cattleyas* which have newly-made sheaths that are easily injured or broken off, often preventing the flower-spike coming up, but not in all cases. Be sure to avoid stripping-off the outer sheathing of the pseudobulbs, which in my opinion causes the plants to look unsightly, and is doubtless injurious, although it must sometimes be done in a moderate degree to eradicate scale. *Angulba Clowesii*, *A. eburnea*, *A. Ruckeri*, *A. uniflora* that have been grown during the summer at the cool end of the stove or *Cattleya*-house should by this time be well matured, having had water gradually withheld from them. They need but little water for some time, and may be removed into a much cooler house. I rest these plants in the *Dendrobium*-house from this time until growth recommences. *Vanda teres* should now be kept on the dry side for a time, and given a light position; very little water will be needed after this, but the plants should not become so dry as to cause shrivelling. *Vanda Hookeriana* and *Renanthera coccinea* need the same kind of treatment, otherwise the flowers will be few. *Lycaete Skinneri* and *L. S. alba* are opening their first blossoms, and should not become dry at the roots, otherwise the flowers will be small and lacking in substance, besides exhausting the plants. Weak manure-water should be applied at alternate waterings to these plants if they are healthy and possess plenty of roots, otherwise afford clean water only.

THE HARDY FRUIT GARDEN.

By T. TURTON, Gardener, Maiden Erlegh, Reading.

LIQUID MANURE.—In the event of much rain falling, the manure-tank, if rain-water be conducted into it, should not be allowed to overflow and run to waste, when it is known that Strawberry plants (excepting where newly planted), Raspberry plantations, and Black Currant bushes, are much benefited by having liberal waterings of liquid-manure even during the winter when it is plentiful in most places. Old Pear and Plum trees planted against the walls of buildings, or solitary specimens on the lawn or in odd corners, and which may have

exhausted the ground of its fertility, also will be much benefited by liquid-manure of some kind, even the drainings from hot-beds, if it can be caught in tubs sunk below the level of the ground, are of service. Previous to applying manure in the liquid form, the soil if hard should be broken up, for unless the liquid reach the subsoil, in good quantity, little benefit will accrue to the trees. Where trees are growing on turf, the effects of a moderate quantity only will be noticeable by the earlier and heavier yield of grass. Yet this will not benefit the tree, and unless a large quantity is afforded, the labour entailed, so far as the tree is concerned, is wasted. Rainy weather, which usually stops pruning, &c., affords opportunities for carrying out this kind of work.

THE ORCHARD: TOP DRESSING.—That orchard trees are much benefited by being afforded suitable top-dressings, I have full proof in the orchard under my charge at this place. The soil of this orchard is of the poorest kind, light and gravelly. For several past years I have afforded the land a yearly top-dressing of very strong loam, almost approaching clay, and from these trees finer fruit is now obtained than from bushes of the same varieties planted in the kitchen garden. Top-dressings afforded early in the winter get pulverised by frost and rain, and the earth-worms carry some of the nutrimenta contained in it to the roots. Any kinds of strong loam or clay form a suitable top-dressing for light soils. Where the staple is strong loam or is clayey, top-dressings of burnt earth (ballast), or charred garden refuse will attract some of the roots to the surface, and therefore, into a more fertile medium benefiting growth and the fruit. Chalk, in districts where it is to be obtained, is a valuable dressing for cold heavy land. For orchards of large extent, where the top-dressings will have to be got on the land by horse labour, preparations should be made to begin the hauling directly the ground is frozen sufficiently hard to carry a horse and cart.

THE KITCHEN GARDEN.

By H. C. PRINSEP, Gardener, Buxted Park, Uckfield.

HINTS ON URGENT WORK.—December is usually a cold month, in which all growth outdoors is brought to a standstill; but it affords opportunity in open weather to prepare plots for sowing and planting, digging and trenching being pushed on with whenever the soil is not too wet or sticky. Doing this kind of work early in the winter makes the gardener independent of the state of the weather in mid and late winter. The manure that was spread on the beds of Asparagus should be stirred about and broken to pieces; the rougher parts being left to be raked off in the early spring. By acting in this manner the utmost amount of nutriment is extracted from the manure.

HORSERADISH deserves more attention than it usually obtains, and at this season the leaves having mostly died down, the roots may be lifted, getting out every bit by trenching the land. The long thin roots should be got out entire, these making the best sets. When all is lifted, the ground should be well manured and re-trenched, putting the manure into the bottom of the trenches. Having waited some weeks for the land to settle, holes should be made with a long dibber to a depth of 1½ foot or more if the land allows of it. The sets may be put in at 6 inches apart, or more if space is no object, letting them fall right end upwards to the actual bottom of the holes. The space between the rows may be 2 feet. If there are not enough long root-sets, the crowns may be taken off those reserved for use and planted, all the buds except the central one being removed. It is good practice to fill up the holes with some rich soil; and should the soil be too shallow to allow of perpendicular holes being made, make them in slanting fashion, filling in as before advised. Roots for use should be laid in a cool border facing north, and covered with litter.

CELERY.—The latest successions should be finally earthed up when the soil is not wet, and doing the work well, so as to exclude frost as far as possible from the stems. The ground whence early crops have been lifted should be trenched, and left rough till wanted.

SEAKALE.—“Thongs” large enough for furnishing sets for planting should be collected as the roots are lifted for forcing, cutting them into 4-inch lengths, and making a slanting cut at the lower end and a straight one at the top, so as to be able to distinguish the top from the bottom of the set. These may be planted at once, or left laid in soil till

the end of the winter. Seakale ground can scarcely be too rich, and it is always best if it have not been recently cropped with any of the Brassica family. Planting should be done as digging proceeds. The sets may be put in at 6 inches apart in the rows, or even closer, if sufficient ground be not available at present, transplanting each intermediate root in the spring; the rows, however, should not be nearer to each other than 2 feet, for it is much better to have a smaller number of good crowns than a lot of inferior ones.

FRUITS UNDER GLASS.

By M. TEMPLE, Gardener, Carron House, Falkirk, N.E.

VINES.—It is of importance to have the soil in which early Vines are being started in a healthily moist state, and to insure that this is the case, it should be afforded water at a temperature of 80° or 85° in sufficient quantity to wet it thoroughly; the water used for syringing purposes should be as warm or warmer. Protection should now be afforded the roots of mid-season Vines; and if the roots of any Vine are near the surface, they should be mulched, to preserve them from frost. When forcing is begun, the warmth of the Vine border should be not less than 60°. Ripe Grapes hanging on the Vines should be examined twice a week for decaying berries, and every leaf removed from the vine as soon as it falls. If plants must be placed in theinery, the Grapes should be cut and bottled, keeping them in a dry cool room. Grapes keep in better condition if before they are cut the leaves drop. An even temperature of 45° to 50° should be maintained.

THE PEACH HOUSE.—Those houses which have been already closed, should be kept at a very even temperature, affording air to the trees when the warmth has risen to 55° by sunheat. In sunless weather 45° to 50° may not be exceeded for the present. Keep the house moist, this is very essential, but do not allow the air either by day or night to become stagnant, let there be some motion in it, if ever so little. When water becomes necessary, let it be afforded in a pretty warm state of 80° to 85°, and the state of the border should be examined at short intervals of time with a probe-stake, for nothing is so certain to lead to fruit-bud dropping as dryness of the soil.

FIGS.—Trees in pots should be plunged in litter, kept in a shed where frost cannot harm till forcing time arrives. If the houses in which Fig trees are planted-out are used for salad plants, the roots of the Figs are liable to suffer from souring of the soil, and the upper portion should be removed before growth begins. All pruning of Figs should now be finished, and ought to consist of merely thinnings out of useless and misplaced shoots. Early Figs, if treated like Peaches, do well. If pot-Figs are plunged in tanners' bark, leaves, or even in a shallow bed of leaves over water-pipes, the heat should not exceed 80°, and at the first 70° is sufficiently high.

CUCUMBERS.—The young shoots must be regularly stopped at the points, and much of the young fruit cut off before the plants are weakened. Water carefully, and afford air whenever it can be done safely, and keep up a temperature of 65° to 70°.

THE FLOWER GARDEN.

By T. H. CRASP.

THE GLOBE FLOWER (TROLLIUS).—These showy plants are among the best and most distinct of spring-flowering hardy perennials, and very useful plants for planting in moist parts of borders, &c., where other plants would not flourish. The present is by far the best time of the year for increasing and replanting Trolliuses. The plants delight in a rich moist soil. The plant is very graceful and ornamental, and the flowers are nice for indoor decoration, lasting a long time after being cut. The long stems and graceful foliage make them capital flowers for putting in vases. The finest for garden decoration are *T. europæus*, *T. asiaticus*, *T. napellifolius*, *T. Govani* fl.-pl.

TREE PÆONIES.—These are most useful and beautiful plants, grown either as isolated specimens on the lawn, or mixed with other plants in the herbaceous border. The plants prefer an open situation, exposed to the afternoon sun, for the due ripening of the wood. They need protection from north and north-east winds, and from the early morning sun, which spoils their blooms on frosty mornings if it shine on them. Pæonies will grow in any fairly

good garden soil, if it be not shallow or very dry. The present is a good time to plant them; and as the varieties are numerous and beautiful, space does not serve for the mention of particular varieties.

CLIMBERS.—The pruning of some of the deciduous climbers on walls and trellises may be proceeded with; avoiding too much neatness and stiff training which are undesirable in climbers. The Clematis, Lonicera, Passiflora which flower on the young shoots, should be taken in hand first, namely, those of the lanuginosa type, of which there are many varieties, some flowering from June to September, and others from July to October. A few of the former are Alba magna, Blue Gem, Mrs. Moore, Princess of Wales; and of the latter lanuginosa and its several varieties, as candida, nivea, pallida, violacea, Adeline Patti, Fairy Queen, Forget-me-Not, Lady Caroline Neville, Modèle, and many more. Clematis Viticella varieties bloom also on the young wood, and may be pruned at this season. C. Jackmani is another, consisting of many fine varieties, which blooms on the summer shoots. Those Clematises which flower on old wood, and must therefore get their pruning after blooming is past, are those of the Florida section, including such varieties as J. Gould Veitch, Sieboldi, Snowflake, Unique, &c., and C. patens and its varieties, of which we name Mrs. Quilter, Marie, Maud, Maid of Kent, Charles Noble, atro-purpurea, and Calypso. Tea Roses should have their long shoots tied in, but the pruning part should be left till February. The long flowering-shoots of Banksia Roses and Chimonanthus fragrans should be tied in, but the pruning should not take place till after flowering.

THE APIARY.

By EXPERT.

WIDE METAL ENDS FOR SHALLOW FRAMES.—A wide metal end, specially made for use on shallow frames, will shortly be in the market. The advisability of spacing these frames in surplus chambers at a greater distance apart than when standard frames are used, namely, half an inch, has been suggested from time to time, and, indeed, already adopted by several of our leading bee-keepers. The subject was brought up for discussion at a recent meeting of the British Bee-keepers' Association, and a resolution to the following effect was put and carried almost unanimously:—“That in the opinion of the majority present at this meeting, it is advantageous to work for combs of 2 inches width in shallow frames.” The new metal ends, therefore, will have a shoulder projecting half an inch instead of a quarter, as made for the ordinary standard frame, thus allowing eight frames, spaced 1 inch apart, to take the place of ten with the old distance of half an inch between. It may be mentioned that the standard shallow frame is precisely similar to the ordinary standard in all respects, except that the depth is 5½ inches, instead of 8½ inches. The principal advantages claimed for them are, that the hive is cooled to the least possible extent when they are first put on, so that the bees are enabled to commence work earlier in the surplus chambers; that they are better filled, and more evenly sealed; consequently, the cappings can be more easily sliced off with the uncapping-knife. When spaced an inch apart, they are filled with honey with less labour to the bees, because less wax has to be provided than in the deeper frame. When in the extractor, there is no danger of a breakdown, as there is greater rigidity of the comb, and thinner sheets of foundation can be used at the start off. A shallow frame, worked as described with the wide-ends, will weigh over 6 lb. when full of honey, whereas an ordinary standard frame in a like condition will only weigh about 5 lb., with a much greater expenditure of wax. As the ends will be of the well-known W. B. C. pattern, it will be possible by shifting every other one back, to reduce to the ordinary space, should it be required to do so, on account of a diminishing honey-flow, or for any other reason.

DOUBLE NUCLEUS HIVES.—Nucleus hives made to hold two colonies will be found to be a great advantage when the time comes round again to use such things. They should be made to hold eight frames, which are divided in the centre with a thin division-board, perforated, if preferred, as on the Wells' system. The entrances should be at each end. Two nuclei in a hive of this description would no doubt winter perfectly, and spare queens could be thus kept till the following spring, at which time they are most valuable, and so difficult to obtain.

EDITORIAL NOTICES.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

THURSDAY, DEC. 7. { National Rose Society: Annual Dinner at the Hotel Windsor, at 6 P.M.

SHOW.

TUESDAY, DEC. 5. { National Chry-anthemum Society, Winter Exhibition, Royal Aquarium, Westminster (3 days).

SALES.

MONDAY, DEC. 4. { Dutch Bulbs, at Protheroe & Morris' Rooms.
Plants from Belgium, Ferns, Standard and Dwarf Roses, and Hardy Bulbs, at Protheroe & Morris' Rooms.
Dutch Bulbs, Liliams, &c., at Stevens' Rooms.

TUESDAY, DEC. 5. { Dutch Bulbs, at Protheroe & Morris' Rooms.
Special Sale of Hardy Bulbs, at Protheroe & Morris' Rooms.

WEDNESDAY, DEC. 6. { Dutch Bulbs, at Protheroe & Morris' Rooms.
Azaleas, Camellias, Palms, &c., from Ghent, Roses, Border Plants, and Dutch Bulbs, Liliams, &c., at Stevens' Rooms.

THURSDAY, DEC. 7. { Great Sale of Japanese Lilies, Begonias, Plants from Belgium, Standard and Dwarf Roses, and Dutch Bulbs, at Protheroe & Morris' Rooms.
Dutch Bulbs, Liliams, &c., at Stevens' Rooms.

FRIDAY, DEC. 8. { Imported and Established Orchids at Protheroe & Morris' Rooms.
Dutch Bulbs, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—41° 2.

There are few points in the Parish Councils Bill that are creating more interest in rural districts than the clause which relates to the provision of garden allotments. Almost wonderful is the growth of the allotment movement, and under the new county dispensation of technical education it is rapidly expanding, and will continue to expand for a long time. It is very obvious, that to furnish instruction in counties in horticulture is of very little value, unless effort be made to enable this instruction to be put to practical use, and that means to that end can, in a very large degree, be furnished through the agency of the parish councils, when established, there can be no doubt. Very much of the value of these councils' powers will hinge on the retention of the word "compulsorily" in the particular clause, though here subject to the sanction of the Local Government Board, it is obvious that unless some such compulsory power to "hire" (not purchase) land for allotments be granted to parish councils, they will, in their efforts to obtain suitable ground, be driven from pillar to post in the most annoying way. Whilst no duly elected public body would, under any circumstances, suggest confiscation, it is equally certain that the Local Government Board would always act the part of a just arbitrator. When, however, the question arises as to whether the needs, interests, and requirements of, perhaps fifty, perhaps a hundred, decent workers are to be of weight or not as against one person's antagonism, there should be little

doubt as to which side should kick the beam. We have already in existence several Allotment Acts. Still, the number of allotments that these have helped to furnish is relatively few; they have remained largely dead letters, through the lack of the needful compulsory powers, and also to some extent because the various local sanitary authorities working the Acts had generally little sympathy with allotments. By this time all broad-minded and honourable members of sanitary authorities, and especially of the County Councils, can hardly do otherwise than recognise the absolute need there is for this new force; and when it has been in operation a few years, even antagonists now will then admit that it is a wise and valuable force.

The same need has already been found in relation to the Small Holdings Bill of the late Government; but with that we have nothing special to do now. It is worth while saying, however, that where allotments have existed, and applicants under that Act for holdings have been steady industrious tenants, showing great capacity in cultivation and cropping, their demands not only merit but should receive the fullest and kindest consideration. Where no allotments exist, it is not too much to suggest that these should be first compulsorily provided by the new parish councils, and then they should have power to advance the best workers into larger holdings some three or five years later, if they so desire. We should in that way promote a means whereby the land would be held under greatly altered conditions, and in some way assist to realise that pastoral time "when every rood of ground sustained its man." Very naturally the worker class in rural parishes, those most desirous of securing allotments, are concerned as to the threatened antagonism of the clergy, as manifested in some directions. That form of objection is dying out as the Bill is better understood. As evidence of that, we may mention a short interview we had the other day with a most earnest working vicar of a rural parish in Surrey who was positively anxious that the word compulsory in the Bill should be retained, because he felt that without such power the clause might be valueless. He is one of those genial warm-hearted men who knows how to make friends with everybody, and has amongst his parochial helpers some working men who are opposed to him in politics. Such a man would be certain of election on to the Parish Council, and very probably would be its chairman. Why is he so anxious about allotments?—because those already in existence in his parish, and so much prized by the holders, hang as a rule on a thread. They may be taken from the workers almost at any moment, and their position is far from being the best. He is profoundly concerned for the welfare of the allotment-holders, hence his deep interest in the Parish Councils Bill. Are there not numbers of clergy in the kingdom who will be as ready to welcome the Act, and assist to work it in the interests of their poorer neighbours? We think so, just as there are thousands of workers who are anxiously looking for the passage of the Act and may find it in the matter of getting allotments a saving grace. Even yet we hear people, must we add very ignorant people, assert that unless the rent of allotments is nominal they cannot be made to pay. That objection is best answered by allotment-holders themselves. If it were so, however, why this incessant demand for allotments? But the rent value of allotments is a matter to be determined by local conditions, situation, soil, accessibility, &c.; for whilst some ground hardly possesses prairie

value, other land may be found of the very best. Now, 1s. per rod, 20s. per annum for plots of one-eighth of an acre, is esteemed a very high rent, and yet at such a place as Richmond, in Surrey, that sum is paid cheerfully. There the splendid area of 20 acres, comprising 196 plots of diverse dimensions, is entirely occupied. It is provided by the Richmond Corporation as the sanitary authority, the ground being hired from the Crown at a high rental. This land was for very many years under market garden cultivation; but whilst that seemed to comprise ample ploughings, liberal manurings, and frequent croppings, it was never worked more than 12 inches in depth. The subsoil remains to-day, where yet unbroken, as hard and virgin as it was 100 years ago. We saw these allotments cropped for the first time in the summer; they were in every case well done, though owing to the shallowness of the soil suffering somewhat, as elsewhere, from the drought. We saw them again a short time since, when without exception they were as full as could be of growing, indeed, first-rate winter crops of all descriptions. Probably each 20 rods had upon it 40s. worth of winter crops, and that is perhaps a low estimate. Better could hardly have been found in any garden. Every effort was being made to store manure for use as the ground was cleared, and where there was space trenching and manuring had already begun. The workers are strangely enough nearly all engaged in some form of town occupation, knew little or nothing of gardening beforehand, some had hardly ever handled a spade, and yet their first year's results were worthy of high commendation. All honour to the Richmond Corporation. May hundreds of similar authorities be induced to go and do likewise.

STANHOPEA LOWII.—Our illustration (fig. 107, p. 689) gives a representation of this beautiful new plant, which first flowered with the importers of the species, Messrs. Hugh Low of Clapton, in December, 1892. It was shown in flower quite recently, at the Royal Horticultural Society's meeting on Nov. 14, when it received an Award of Merit. As will be seen in the figure, it differs from the usual forms of *Stanhopea* as seen in gardens, in being hornless, in that respect somewhat approaching *S. ecornuta* and *S. eburnea*, which has inconspicuous horns at the base of the lip, and in being identical in form only with *S. Amesiana*, a species also imported by Messrs. Hugh Low & Co, and which may perhaps be regarded as a white form of the species under notice. The flowers of *S. Lowii* have sepals and petals of a whitish-huff colour; the petals obscurely marked with small reddish dots. The labellum is of ivory-whiteness, with some purple lines or blotches in the interior of the hypochile. *Stanhopeas* are not in fashion just now, or this would have been an introduction to have caused a great stir among Orchid-growers. Years ago the fine collections of Orchids staged at the famed Chiswick shows of the Royal Horticultural Society, did not disdain to include a large specimen of *S. tigrina*, *S. Devoniana*, or *S. oculata*, and whenever exhibited the *Stanhopeas* came in for a fair share of admiration. Even now when seen in flower in our Orchid-houses a *Stanhopea* arrests attention more than many costly species which have not so singular a form, consequently they are tolerated in many places, rather than cultivated in the manner which their extraordinary showy and fragrant, though rather fugacious flowers, would warrant. *S. Lowii* is a New Granadan species, and like all the other *Stanhopeas* should be grown in a basket, in order that its descending flowers may be protruded without hindrance. It was described by ROSE in *The Kew Bulletin*, 1893, p. 63, and in *The Orchid Review*, i, p. 177, fig. 12.

LINNEAN SOCIETY. — At the meeting on Thursday, November 16, Prof. STEWART, President, in the chair, Messrs. R. ASSHETON, H. N. BERNARD, and W. H. WILKINSON were admitted Fellows. Mr. J. H. VEITCH exhibited a large and interesting collection of economic and other vegetable products of Japan, recently brought by him from that

ably large specimen of the Giant Puff-ball, *Lycoperdon giganteum*, which he had gathered at Catford Bridge, and which, in the opinion of botanists present, was above the usual size. On behalf of the Rev. Prebendary GORDON, M.A., the Secretary exhibited a plant of *Veronica salicifolia* of New Zealand, found growing in Langland's Bay, Mumbles, Swan-

ever to the primary cause of any modification of structure (*Animals and Plants, &c.*, vol. ii., p. 272); 2, that modifications of structure are due to the direct action of the environment (*vide* DARWIN, WEISMANN, SPENCER, &c.); this always results in "definite variations," by which Mr. DARWIN signifies 3, that all or nearly all the individuals become

FIG. 107.—STANHOPEA LOWII: FLOWERS IVORY-WHITE. (SEE P. 658.)

country, and described the various uses to which different kinds of wood, fibre, grass, &c., were applied for domestic purposes; as also the way in which various Seaweeds were collected and prepared for food. As the vegetable product was in every case labelled with the scientific name of the plant from which it was prepared, the series was a most instructive one, and a hearty vote of thanks was accorded to the exhibitor. Mr. A. G. RENSHAW exhibited a remark-

sea, the seeds, perhaps, having been introduced in ballast from some homeward-bound ship. A paper was then read by the Rev. G. HENSLOW, M.A., on "The Origin of Plant Structures by Self-adaptation to the Environment, exemplified by Desert and Xerophilous Plants." The purport of this paper was to prove by a direct appeal to facts the probably universal application of Mr. DARWIN'S assertions, viz, 1, that natural selection has no relation what-

modified in the same way (*Origin of Species*, 6th ed., p. 106), and consequently, 4, that "a new variety would be produced without the aid of natural selection" (*Animals and Plants*, ii., 271; *Origin of Species*, pp. 72—175). Mr. HENSLOW showed, 1, that all the species constituting the peculiar *facies* of a desert flora are the direct result of their climatic conditions; 2, that these peculiarities are in nearly all cases of the utmost benefit to the plants, such as the hardening

of the tissues, the reduction of parenchyma, the minute size of the leaves, the dense clothing of hair, a thick cuticle, the presence of wax, storage of water tissues, &c.; but, 3, these features are just those which systematists utilise as descriptive characters of varieties and species. Mr. HENSLow observed that by DARWIN'S assuming that "indefinite variations" which are characteristic of cultivation were equally so in nature, he reasonably required natural selection to correspond with artificial selection; but that assumption he believed to be erroneous. For experiments proved that by sowing seeds in a very different medium, all the seedlings vary in the same direction, viz., that of adaptation to the new environment, verifying Mr. HERBERT SPENCER'S statement that "under new conditions the organism immediately begins to undergo certain changes in structure fitting it for its new conditions." The conclusion is thus arrived at which is expressed in the title of this paper. The functions of natural selection therefore become limited as follows: 1, the survival of the constitutionally strongest amongst seedlings; 2, delimitation of species, by the non-reproduction of intermediate forms; 3, the geographical distribution of plants by self-adaptation. An interesting discussion followed, in which Professor REYNOLDS GREEN, the Rev. Dr. KLEIN, Mr. PERRY COSTE, and others took part.

— An evening meeting will be held on December 7, 1893, at 8 P.M., when the following papers will be read:—I. "Catalogue of the described Neuroptera odonata (Dragon Flies) of Ceylon, with description of new species," by W. F. KIRBY, F.L.S., &c. II. "On the cause of the fall of the Corolla in *Verbascum*," by Signor U. MARTELLI.

DUTCH HORTICULTURAL AND BOTANICAL SOCIETY: Floral Committee, November 11.—The committee awarded First-class Certificates to Messrs. E. H. KRELAG & SON of Haarlem, for *Lilium nepalense*, D. Don (insufficiently-known plant); *Richardia Rehmanni* (new plant); to the Botanical Garden of Amsterdam, for *Peperomia metallica*, Lind. et Rod. (new plant). Second-class Certificates to Messrs. E. H. KRELAG & SON of Haarlem, for *Eucharis Lowi*, Bkr. (new plant); to the Botanical Garden of Amsterdam, for *Tropæolum Lobbianum*, Spitzfire fol. var. (new plant); to *Abutilon hybridum Souvenir de Bonn* (new plant).

TECOMA SMITHII.—In the account we gave of this beautiful plant in our last issue, we inadvertently omitted to state that it was introduced from South Australia by Mr. W. BULL in 1889, and finds a place in his catalogue for 1889.

CHRYSANTHEMUM SHOW AT BECCLES.—The fourth annual show of the Beccles and district Chrysanthemum Society was held in the Town Hall on Wednesday, November 22, and following day. The exhibition was an excellent one in every way, entries being numerous, and plants and cut blooms of great merit.

PEARS ON WARM WALLS.—In the generality of seasons there are certain varieties of the Pear which, even when planted on walls having warm aspects, seldom produce fruits that can be called "nice eating." Such are all of the Crassane race, *Beurré Rance*, *Jean de Witte*, *Alexandre Lambre*, a Pear of Van Mons' raising, and said to be good in Belgium; *Bergamotte d'Automne*, an October and November Pear, but not usually attaining perfection in this country; *Bergamotte d'Espéren*, a very late variety, of fine quality in good years; *Bezi Mai*, another of Van Mons'; *Beurré Bosc*, B. de Jonghe, an excellent Pear in good seasons, and by some liked better than *Marie Louise*; and *Beurré Langlier*. The above are considered good varieties, but they do not always succeed in these islands, and it would be of interest to our readers if correspondents would give their experience of 1893.

NICARAGUA.—In the spring of the present year our valued correspondent, Mr. J. H. HAAR, of Trinidad, visited Nicaragua for the purpose of inspecting

the Cocoa plantations, the Sugar factories, and Coffee estates. Mr. HAAR tells us that he had little opportunity for collecting, but that the flora of the country is almost identical with that of the West Indies.

GUNNERAS.—Of the curious genus *Gunnera*, concerning which Mr. BURRIDGE has an interesting article on p. 681, there are about twenty species. Not all have such gigantic leaves as those of the plants to which he alludes—on the contrary, *G. cordifolia*, from Tasmania, has spatulate Daisy-like leaves; *G. prorepens*, from New Zealand, has small leaves raised on very long stalks; *G. magellanica*, from the Falkland Isles, has leaves like those of the Marsh Marigold (*Caltha*); *G. lobata*, of Cape Horn, reminds one, in the shape of the leaf of *Geranium rotundifolium*. Another interesting point is the singular geographical distribution of the species. There are none in Europe, northern Asia, or North America; one is recorded from the Cape of Good Hope, one from Java and the Philippine Islands, one from Tasmania, five from New Zealand, one from the Sandwich Islands, eleven from South America, including one from Brazil, one from New Granada, five from Chili, two from Juan Fernandez, two from Magellan, including the Falkland Islands. It would therefore seem to be an essentially southern genus, having its headquarters in Chili, but creeping up to New Granada and Brazil, and extending laterally to the Cape of Good Hope, New Zealand, and Tasmania. There is some evidence to show that the genus is represented in Abyssinia (*G. perpensa*) and perhaps in Mexico. Another feature which gives rise to speculation is the marked representation in islands, as will be seen from what has been previously stated. Its presence in Java and in the Sandwich Islands is mysterious. A valuable note on the genus from the pen of Mr. J. G. BAKER will be found in our columns, July 3, 1886.

THE ORCHIDÉENNE.—A Diploma of Honour, à l'unanimité, was awarded to M. Alfred Bleu, of Paris, for a new acquisition, *Lælia juvenilia*, a hybrid between *Perrinii* and *Pinelli*; the divisions of the flower were a beautiful lilacy-rose. Diplomas of Honour were allotted for *Cattleya parthenia autumnalis aurea*, the flower pale creamy-white, very distinct-looking; *Lælia-Cattleya amœna superba*, hybrid between *Cattleya Loddigesii* and *Lælia Perrinii*, the divisions of the flower lilac, the lip creamy-white, bordered with purple—both these fine novelties were also from M. Bleu. M. Van Imshoort staged a new *Cattleya*, *C. Imshoortiana*, L. Lind. et Cogn., exceedingly curious, and described in the last number of the *Journal des Orchidées*. A fine *Cattleya labiata* from M. Linden obtained a First-class Certificate of Merit; the divisions of the flower were large, and of an exquisite rosy tint. M. Treyeran won the same distinction *par acclamation*, with a *Lælia præstans* of surprising beauty; the divisions of the flower were of unusual size, velvety, and of an exceedingly lovely colour. M. Linden showed a fine lot of *Cypripedium insignis montanum*, a remarkable *Cochlioda Noetzi*, with large and beautiful flowers of a charming colour; *Acridea angustianum*, with two clusters of great beauty; *Oncidium tigrinum*, with unusually dark blooms, the divisions of the flower deeply coloured, the lip of large sulphur-yellow, very distinctive. M. Madon staged a capital *Cypripedium insignis montanum*; M. de Lansberghe, a plant of *Cypripedium philippinense*, with six blooms; M. Van Imshoort, a fine well-flowered example of *Cymbidium affine*; and M. Linden, a delightful variety of *Cirrihopetalum Amesianum*.

"THE SILVA OF NORTH AMERICA."—The fifth volume of this superb work is now published (Boston and New York: HORTON, MITCHELL & Co.). It is dedicated to M. F. L. OLMSTED, and comprises a full description, with illustrations of the trees belonging to twelve orders, so far as they are represented in the United States, thus bringing the work up to the Sapotaceæ. We shall take an early opportunity of alluding to the work in detail, but in the mean-

time we may congratulate Professor SARGENT, not only on the excellence of his work, but upon the regularity of its publication.

DEVON AND EXETER GARDENERS' ASSOCIATION.—At the meeting of this Association at the Guildhall on Wednesday evening, November 22. Mr. HILL, of Pinhoe, presiding, Mr. GEORGE LANSDALE opened a discussion on "The Recent Shows." He remarked, that in his opinion the recent Chrysanthemum show in Exeter was second to none in the West of England. Schedules of the forthcoming private show of Hyacinths, Tulips, Anemones, Primulas, Primroses, Auriculas, and other spring-flowering plants, which has been fixed for Wednesday, March 21, were distributed.

THE ROYAL GARDENERS' ORPHAN FUND.—A well-attended meeting of the committee took place at the Horticultural Club, on the 24th ult., WILLIAM MARSHALL, Esq., presiding. The following special receipts were announced: proceeds of a concert by the Kingston Gardeners' Society, per W. Furze, Esq., £21 13s. 6d., at the opening of the gardens at Ketton Hall, Stamford, to the public, per Mr. W. H. Divers, £2 6s. 5d. Sales of fruit at a fruit show, Reading and District Gardeners' Society, per Mr. J. Pound, secretary, £5 15s.; Mr. G. W. Cummings, gardener, The Grange, Carshalton, the sum of £3 14s. paid by the public for admission to see the Chrysanthemums; Midland Carnation and Picotee Society, per Mr. R. Sydenham, £5; Mr. W. Bates, box at Twickenham flower show, £1 16s.; Mr. J. Wright, 171, Fleet Street, donation, £1 1s. Boxes: Mr. A. D. Christie, Ragley Gardens, Alcester, 8s. 9d.; Mr. W. H. Divers, Ketton Hall Gardens, Stamford, 11s. 3d.; Mr. G. T. Call, Charters, 11s.; Romford Chrysanthemum show, 5s.; Miss McDonald, Chichester, 10s. 6d.; Miss E. J. Holmes, Frampton Park Nursery, Hackney, card collection, £6 4s.; Mr. W. G. Head, box at the Crystal Palace, £2 0s. 6d. The hon. secretary brought up a financial statement of the year, and after due consideration it was resolved that five children should be placed upon the Fund. Mr. C. Osman, Commercial Street, E., was elected to the vacancy on the committee, caused by the lamented death of Mr. Hugh Low. Mr. D. Sheahan, Hartfield Road, Wimbledon, was appointed local secretary for Wimbledon and district. A vote of thanks was passed to the chairman for presiding.

— Interest in this deserving institution is not lacking in Cheshire. The Altrincham Gardeners' Improvement Society, by means of a concert held last year, were enabled to raise £20, and we are now informed by the secretary, Mr. WM. PLANT, The Gardens, Woodbegg Hall, Ashton-on-Mersey, that they will hold another of these entertainments under the patronage of Lord EGERTON, on Wednesday, December 6, in the Literary Institute, Altrincham, when they hope to be even more successful. The entertainment will consist of a "Limelight exhibition of picturesque bits near home, and glimpses of Mona's Isle and Bonnie Scotland, varied at intervals by vocal and instrumental music." We wish the committee every success.

THE ROYAL HORTICULTURAL AND THE IMPERIAL INSTITUTE.—We believe that the proposal, alluded to in our last issue, and which gave rise to so much anxiety has not been entertained, a strong feeling existing that it is better to let well alone.

HENRY CANNELL, nurseryman, of Swanley, has been awarded by the Council of the Academy (Industrial) of Science and Arts, Brussels, the diploma of that Institution, and the free membership of the same, the honour having been conferred for useful invention, commerce, and for the common good.

MR. DUNCAN WALSH.—We hear from Dublin with much regret, of the death of this gentleman, who had but recently retired from the service of the Earl of PEMROKE, Mount Merrion, Dublin. Mr. WALSH was a leading man in horticultural circles in Dublin.

HOME CORRESPONDENCE.

THE HOME v. THE FOREIGN GARDENER.—Mr. Watson, in his very able reply to M. Lucien Linden, does not mention one of the greatest factors in the cultivation of plants, viz., the perfectly-adapted plant structure. He mentions Masdevallias as being particularly well done at Brussels, but were they not done as well, if not better, in the palmy days of Trentham, in the model house erected by the late Zadok Stevens? This British gardener was also an excellent cultivator of *Odontoglossum crispum*. Where houses have been designed by such thoroughly practical men as the above, success has invariably followed. Unfortunately, in this country, gardeners and nursery foremen are often expected to grow plants to perfection in structures entirely unsuitable to their requirements. Where will you find such marvellous results and such splendid culture as is shown by the average home market gardener? And why? It is primarily the perfect plant structure, designed, and often built with his own hands. The magnificent plants seen in the London markets could not be grown so well if it were not for the perfectly-suitable houses, as only ordinary labourers are employed in potting, watering, &c. In private gardens, and often in large trade establishments, structures are put up by the owner's desire, which, owing to their lack of cultural knowledge, are oftentimes not at all suitable, whilst the owner thinks that if the plants do not flourish, it must be the gardener's fault. Thought is given only to the beauty of the building, its tiled paths, cement and iron stages, &c., and in which the air is rendered like that of a bake-house. When our gardeners have suitable houses in which to grow their plants, we shall not have the spectacle of the foreigner telling us his culture is superior to ours. *W. H. Young.*

THE WEATHER REPORTS.—In your weather reports for the last two weeks, it is stated that in every district except the Channel Islands there was frost, and "sharp frosts," on the 5th, 6th, and 7th, Mr. Elliot, of the Falmouth Observatory, tells me that their minimums on those days were 50°, 37°, 7, and 35°, and that up to the 22nd their lowest minimum for November was on the 1st, when 33° 6 was registered. Are no reports sent in from this specially-favoured locality, where Oranges have lived out-of-doors for a generation, and Bananas stood through last winter with slight protection? Information from other correspondents would be of interest. *Richd. Binns.*

IRISH GARDENERS.—I apologise to Mr. Barbidge and our friends the Irish gardeners for having appeared to overlook their claims to be regarded as equal to Englishmen (including Welshmen), and Scotchmen as cultivators. I am acquainted with a good many Irish gardeners of first-rate ability, both in Ireland and in this country. My mistake was in thinking that the term English would stand for all natives of the British Isles. I added Scotchmen to please a Scotch friend here who always corrects me if I do not give his countrymen a turn. Once upon a time to be called English was not objectionable to any native of the United Kingdom. Anyhow, whether it is to be Ireland a Nation, Separation, or what, we are united in our love of horticulture; and there is no difference between us, so far as I know, in gardening skill. *W. W.*

EARLY BLOOMING OF LILY OF THE VALLEY.—About a month ago we received by parcel-post from an unknown source, samples of Lily of the Valley "crowns," consisting of two bundles with buds of a very pale green colour, and two bundles with buds of a deep purple. After keeping them for about ten days, and receiving no communication about them, we had them potted on November 10, and to-day (November 17) the first named are in full bloom, and with the leaves fully developed. We may add that the ones with the deep purple buds, though planted at the same time and grown under the same conditions, are only about an inch high. *Pope & Sons, King's Norton.*

GRAPES SHANKING.—Not far from where I am writing, there is a vine in length 100 feet, and width 20 feet, built on high ground, and outside the viney the ground drops 4 feet. The Vines are planted in an inside border, and I have not seen a shanked berry on the Vines, Muscat of Alexandria, these twenty years, till last season, when a new gar-

dener having taken charge, the Grapes shanked very much. The cause of this seems to have been a too abundant supply of water at the roots, very much more than the former gardener had afforded them. I could mention several gardens where shanking takes place, but this Vine seems to point the moral best, as it was one of the most free from that malady, and to show that a viney should be on elevated ground. *S. Maers.*

CHRYSANTHEMUM MRS. ALPHEUS HARDY.—When visiting Hill Carr, Bowden, Cheshire, a few days ago, I was struck with the sight of the above Chrysanthemum, which is a variety that has not been successfully grown by many gardeners. There are some ten plants of the variety growing in 10-inch pots, perfect marvels of good culture, the largest plant carrying fifty fully open flowers, similar to the two flowers enclosed. This plant is four years old, and Mr. Tibbles, the gardener, told me that this plant has not been re-potted for two years, and has been grown in the Azalea-house since it was struck from a cutting. I have seen it each year since, and can say that it has always carried about the same number of flowers. More plants have been grown this season, and these are as good as the old plant, grown outside with the rest of his plants. Five plants have twenty flowers each; and two others, two years old, trained on balloon trellises, are quite as fine as the others. Again, the tops of the old plants were struck last May in 60-pots, and potted into 6-inch pots; these average from fifteen to twenty rather smaller flowers. Other Orichth Plume varieties may be mentioned, viz., *Enfant des Deux Mondes*, *Louis Boehmer*, *Wm. Falconer*, *W. A. Manda*, all very good, but none is equal to *Alpheus Hardy*. I may say the general collection of it is very fine indeed, the plants grown naturally for cutting purposes. In the large conservatory, which is now very gay, is a fine specimen *Cycas revoluta*, with forty large fronds 8 feet through, bearing an enormous cone—a perfect plant. In the stove there are three varieties of *Anectochilus* growing in small glass cases—beautiful healthy plants, such as we are not in the habit of seeing every day, *A. intermedius*, *A. petala*, *A. xanthophyllum*. What a mistake it is that these beautiful plants are not taken more care of! Mr. Tibbles telling me the only difficulty he finds with them is during winter, when some may damp-off; but with careful treatment, the plants are of easy cultivation. Taking this garden all through, everything is looking well, some grand Azaleas, Camellias stove plants, and a very nice lot of Orchids in the different houses; one a *Dendrobium thyrsiflorum*, which bore thirty-five grand spikes of bloom last spring. *W. H.*

BULB, SEED, AND PLANT TRADE.—Looking through the *Gardeners' Chronicle*, I notice in the "Wanted" column, the advertisement of a firm who require the services of an "Invoice Clerk accustomed to the Bulb, Seed, and Plant Trade. Hours long. Salary 2ls. per week." Truly, this is a magnificent opportunity for a man of good education, who has served ten, or perhaps fifteen years to the trade, and who may or may not be a married man, with or without a family; doubtless this clerk will be required to furnish high testimonials as to honesty, sobriety, and above all his willingness to submit to work hard for as many hours out of the twenty-four as his employer may wish to keep him at it. This I am afraid is getting to be the rule rather than the exception in the London trade. It would be better to send our boys to learn to be bricklayers, who can earn 10d. to 1s. per hour, and find ready employment as a rule. But what about those, who having plied their energies to the trade, and find it too late to turn their attention to something better? Let them ask themselves has not the time arrived when they should have a trade union to protect their interests, the necessity for which is further shown by the action of the London County Council. This body has resolved to add to their standing orders one providing that in the absence of a trade union for any particular trade, the council will fix the minimum rate of wages to be paid, the maximum number of hours to be worked, and the conditions to be observed. These regulations, it is presumed, apply to all contracts under the County Council, and this being the case, it is time those interested should be paying attention to these matters, considering the fact that large contracts are let out by this County Council for nursery stuff and seeds. *Thos. D. Smith, 5, Dingle Road, Birkenhead.*

EARLY AUTUMN FROST.—In answer to Mr. Myton's inquiries respecting early autumn frosts

(*Gardeners' Chronicle*, November 18), it is usual to have frosts in October in this neighbourhood, which is on the borders of Warwickshire. I find since 1880, with two exceptions, viz., 1883 and 1886, we have had frost in October, ranging from 1° to 15°, and in some cases of several days' duration. On October last, viz. 30 and 31, and November 1, we registered 2°, 10°, 10° of cold. *G. Mitchison, Perry Hall Gardens, Birmingham.*

SOCIETIES.

ROYAL HORTICULTURAL.

NOVEMBER 28.—The holding of two meetings during November this season is a departure from the rule which has obtained during several previous years, when one only has been held. The exhibits at the meeting held on Tuesday last at the Drill Hall, James Street, Westminster, were not so numerous as on many other occasions. Orchids were very few, and only specimens shown for certificates or awards were sent. Chrysanthemums were shown by several growers, and a number of awards were made. A very fine collection of Apples and Pears were staged by an amateur.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. Robt. Owen, C. T. Drury, H. Herbst, R. Dean, Geo. Stevens, C. F. Bause, C. J. Salter, J. D. Pawle, George Gordon, Chas. Jeffries, Jas. Walker, Chas. E. Shea, T. Baines, Chas. Noble, Henry Cannell, and Peter Blair.

A group of well-grown hard-wooded flowering plants and a number of *Solanum capsicastrum* were staged by Messrs. Hugh Low & Co., Bush Hill Park Nurseries, Enfield. The group included *Grevillea alpina*, *Correa picta*, *C. p. rosea*, *C. bicolor*, *C. cuneata*, and *C. verticosa*; also *Acacia platyptera*, *Crowea latifolia*, a good decorative plant, with expanded pink flowers, that should be seen oftener than it is; and *Darwinia Hookeriana*. Also a large group of Cyclamens in first-rate health, and carrying a good number of blooms, but not nearly at their best, as the foliage concealed a great number of pushing escapes (Silver Banksian Medal).

Mr. Geo. Wythes, gr. to the Duke of Northumberland, Spou House, Brentford, put up a pretty group of miscellaneous plants, including *Dracenas*, *Crotons*, *Ferns*, *Poinsettias*, *Calanthes*, and a few plants of *Cypripedium igneum*, very well-flowered (Silver Flora Medal). Mr. Wythes also exhibited a specimen of *Sterculia nobilis* bearing fruit.

Mr. H. B. May, Upper Edmonton, exhibited a fine specimen of *Polypodium Meyenianum*, a pretty Fern from the Philippines. This species is interesting, because the fronds are only fertile upon the terminal half, and this part withers whilst the other half is quite green (First-class Certificate). A similar award was given to some plants of *Acalypha Macafeana* in exceptionally good condition, bearing leaves larger than usually seen, and extremely good in colour.

A group of zonal *Pelargonium* blooms arranged in sprays was from Messrs. H. Cannell & Sons, Swanley; the varieties were similar to those exhibited by the same firm at the last meeting (Silver Banksian Medal).

Several exceptionally well-grown plants of *Lachenalia pendula* were shown by Mr. Thos. S. Ware, Hale Farm Nurseries, Tottenham; also a plant in bloom of *Leontice leontopetalum*, and a pot of *Narcissus monophyllus* (Vote of Thanks).

The absence of rain, and especially of fog, is operating to keep the Chrysanthemums in fine character. Mr. Robert Owen, of Maidenhead, had some of his new varieties so good as to win Awards of Merit. Two pretty Pompons led the way, one quite a small and compact orange-brown variety of the shade of Model of Perfection, evidently very free; and Elsie Walker, orange-brown, with the florets tipped with gold, of good size, distinct, and handsome. Awards were made to two new incurved varieties, one named Mrs. John Mitchell, a sport from Empress Eugénie, and decidedly distinct in colour, the florets silvery-pink on the surface, with a pale pinkish or rosy-buff reverse, the centre gold; and to John Gardiner, a deep yellow, somewhat small-petalled flower as shown, in the way of Mrs. Coleman, but having more gold—fine in colour, and likely to prove useful as an exhibition variety; also to the following Japanese varieties: H. M. Pollett, bright rosy-pink, the somewhat broad

petals reflexed—novel and distinct; and *Le Prince du Bois*, deep yellow, small-petalled, bright and attractive, reflexed, full and deep, but as shown rather rough in the centre. In addition, Mr. Owen had *John Noble*, an incurved Japanese, reddish-chestnut, with a bronzy reverse, broad in the petal; *Elmer de Smith* (Award of Merit), a large and promising flower, reflexed, broad-petalled, bright reddish-chestnut, with a buff reverse; and *H. L. Sunderbrick*, a broad-petalled yellow Japanese. An Award of Merit was made to a fine and striking deep golden reflexed Japanese, named *Golden Gate*, in the way of *Sunflower*, but quite distinct, from Messrs. H. Cannell & Sons, nurserymen, Swanley, Kent; to Japanese Mrs. C. Harman Payne (Calvat), pale lilac-pink, with a delicate pink or deep blush reverse, large and full, but characterized by a certain amount of roughness; and to Japanese *Anemone Judge Hoyt*, an American variety, delicate pink, somewhat curled, gnarled florets, the quilted centre bluish, large, and fine, both also from Messrs. Cannell, who had, in addition, several boards of fine blooms of excellent new varieties, including *Golden Wedding* (Award of Merit), a rich, deep, incurved, hairy-petalled Japanese, and many others.

From Mr. Geo. Stevens came *Pearl Beauty*, a white, massive, broad-petalled flower, of the build of *Comte de Germiny*, having a slight blush tinge, but as this was different in character to *Pearl Beauty*, as previously shown, the committee thought it best not to make an award until the true character is ascertained.

Mr. John Smith, nurseryman, Windsor, had *Royal Windsor*, a delicate blush variety, with yellow centre, strongly recommended for decorative purposes.

Mr. C. J. Salter, gr. to T. B. Heywood, Esq., Woodhatch, Reigate, had three very fine blooms of Japanese *Lord Brooke*, which had nearly lost its incurved character, but still very striking; also Japanese Mrs. *Jeremiah Coleman*, a large, delicate, blush-white variety.

From Mr. W. Seward, Hanwell, came *George Seward*, a deep dark-chestnut flower, needing development; and Mr. C. Blick, gr., The Warren, Hayes, had *Helen Crawford*, a large lilac-pink Japanese, with silvery reverse.

Japanese *Lady Emma* from Mr. J. Reynolds, gr., Netley Court, Hants, is a small soft pink variety; and Mr. James Henderson, gr., Weltham Hall, Huddersfield, had blooms of Japanese Mrs. *Hirst*, a pale yellow, narrow-petalled variety, small and thin.

In the competitive class for *Chrysanthemums* in groups, there were two competitors. Mr. E. Vince, gr., Highgate Cemetery, was 1st, with good plants, and Mr. Wythee, gr. to the Duke of Northumberland, 2nd.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. J. O'Brien (Sec.), Dr. Maxwell T. Masters, Thos. Statter, T. B. Haywood, E. Hill, J. Douglas, W. H. White, F. Sander, and H. M. Pollett.

Messrs. F. Sander & Co., St. Albans, exhibited a charming basket of the delicately-tinted, pinkish-white *Calanthe* × *Victoria Regina*, which was raised a few years ago at Burford Lodge. In growth and in the size of the flower it resembles *C. × Veitchii* (Award of Merit). Messrs. Sander also showed *C. × Sandhurstiana*, a rich rose-crimson form of the *C. Veitchii* section; *Cypripedium* × *Pryorianum* (*Lathamianum* × ♀, *Harrisianum* × ♂), a massively-towered flower, in which the basal part of the upper sepal is nearly black, changing upwards to crimson, and broadly margined with white; the broad petals and shapely pouch are greenish-yellow, tinged with dark red; *C. × Lynchianum* (*Spicerianum* ♀, *Selligerum majus* ♂), with flowers somewhat resembling those of a *C. × Leeanum*, but with the upper sepal quite two-thirds pure white.

Messrs. Jas. Veitch & Son, Royal Exotic Nursery, King's Road, Chelsea, exhibited their new *Cypripedium* × *Minos* (*Spicerianum* ♀, *Arthurianum* × ♂); the upper sepal was pure white, with various shades of purple at the base, the petals taking the downward curve as in *C. × Arthurianum*, they and the lip being dull yellow, tinged with brown (Award of Merit); the curious little *C. × Arete* (concolor ♀, *Spicerianum* ♂); *Lælio-Cattleya* × *Cornelia* (*L. pulchra* ♀, *C. labiata* ♂), a dwarf plant, with flowers like a small *C. labiata*; the singular *Catasetum Darwinianum*, a species from British Guiana (Award of Merit); the pretty North American *Habenaria ciliaris* (Botanical Certificate), and *Cypripedium* × *Cleola*.

Thos. Statter, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), showed the fine *Lælia anceps Amesiana*, with white sepals and petals tipped with crimson, and intense dark maroon crimson lip (First-class Certificate); *Cypripedium* × *Fairriano-Lawrenceanum* (*Lawrenceanum* ♀, *Fairrieanum* ♂) a very pretty flower of the *C. × vexillarium* type. The broad upper sepal was white, with purple and crimson lines radiating from the base; the petals and lip much as in *C. × vexillarium* (Award of Merit); and as *C. × Engelhardtæ*, a name of continental origin, a pale form of *C. × Leeanum*.

R. I. Measures, Esq., Cambridge Lodge, Camberwell (gr. Mr. Chapman), showed a flower of a very distinct form of *Cypripedium* insignis named *C. i. illustre*, the ground colour of a clear yellow, the sepals, petals, and the upper portion of the lip spotted with light chestnut brown. It had a few crimson spots on the white tip of the upper sepal, and was altogether a well-marked variety (Award of Merit).

C. J. Lucas, Esq., Warnham Court, Horeham (gr., Mr. Duncan), sent two well-grown plants of the singular *Dendrobium D'Albertisii*. Mr. H. A. Tracy, Orchid Nursery, Amarynd Park Road, Twickenham, sent *Cyperorchis Mastersii*. Walter Cobb, Esq., Dulcote, Tunbridge Wells (gr., Mr. Howes), exhibited a fine plant of *Cypripedium* × *Cobbianum* (*Lawrenceanum* ♀, *Sallierii* × ♂), with pale green leaves, very prettily marked with dark green transverse lines; and shining rich-coloured flowers, equal in size to those of *C. × Harrisianum*.

W. Thompson, Esq., Walton Grange, Stone, Staffordshire (gr., Mr. W. Stevens), sent a two-flowered spike of the rose-coloured *Cattleya Victoria Regina*. Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, N., showed *Calanthe* × *Mylesii*, like a pure white *C. × Veitchiana* (Award of Merit).

Messrs. Hugh Low & Co., Clapton, sent two varieties of *Cypripedium* × *Pluto* (*Boxalli* × *calophyllum*), with prettily spotted shining flowers, in the way of *C. × veruixium*, and *C. × calnum Ainsworthii*.

W. Rufus Lee, Esq., Beech Lawn, Andenshaw, Manchester, exhibited *Cypripedium* × *Mary Lee* (*Leeanum* ×, *Arthurianum* ×), a very pretty variety, with many of the features of *C. × Leeanum*. The flower had a small area at the base of a bright green, the rest pure white, on the green base and also on the white surface immediately above it were some uniform small purple spots. Petals and lip resembling one of the forms of *C. × Leeanum* (Award of Merit). The same exhibitor also sent a good example of *C. × Leeanum superbum*; and Mrs. Haselfoot, Moor Hill, West End, Southampton (gr., Mr. N. Blandford), exhibited a dozen good spikes of varieties of *Cattleya labiata*.

Fruit Committee.

Present: Philip Crowley, Esq., in the chair; and Messrs. T. F. Rivers, H. J. Pearson, W. Wilks, Harrison Weir, Geo. Goldsmith, Geo. Bunyard, J. Cheal, Wm. Warren, J. Wright, J. A. Laing, A. Dean, G. T. Miles, G. Wythes, Jas. Hudson, H. Balderson, F. Q. Lane, Robert Hogg, and A. H. Pearson.

A capital collection of fruit, chiefly Apples, but including a few dishes of good Pears, was staged by Mr. Geo. Goldsmith, gr. to Sir Edmund Loder, Leonardlee Gardens, Horsham; the most noticeable among the well-coloured, good-sized Apples, were the following:—*Peasgood's Nonsuch*, Lord Derby, *Mère de Ménage*, *Bismarck*, *Cox's Orange Pippin*, *Blenheim Orange Pippin*, *Lady Henniker*, *Tower of Glamis*, *Adams' Pearmain*, *Hollaundry Pippin*, *Barnaek Beautv*, *Emperor Alexander*, *Lane's Prince Albert*, *Newton Wonder*, *King of the Pippins*, &c. The Pears included good specimens of *Glou Morceau*, *Marshall Vaillant*, *Catillac*, &c. (*Silver Knightian Medals*).

Mr. T. Arnall, Brookside, Headington Hill, Oxford, was awarded a *Bronze Banksian Medal* for twelve extra large fruits of *Pear Uvedale's St. Germans*; the largest fruit weighed 3 lb. 8 oz., and the twelve a total weight of 27 lb. 6 oz. A very fine cluster of *Banana* fruits were shown by Mr. C. E. Smith, gr. to Jas. Quartermain, Esq., Silvermere, Cobham, Surrey (Cultural Commendation).

The English Fruit and Rose Co., Hereford, exhibited a dish of *Byford Wonder* Apple, a pale-coloured, very firm, good-sized fruit (Award of Merit). Messrs. W. E. Brown & Son, The Nurseries, Wells, Somerset, had a few fruits of *Bartlett's Glory* Apple, very similar in size and colour to *Blenheim Orange Pippin*. Messrs. Geo. Bunyard & Co., Maidstone, showed a dish of *Foster's Scarlet Prolific* Apple; this was a good-looking fruit, of medium size, and very highly coloured. Another good-

looking Apple was shown by the same exhibitors, named *Bunyard's Christmas Pearmain*. A seedling Apple, named *Oueeley's King of the Valley*, came from Messrs. J. Peed & Sons, Roupell Park Nurseries, London. MM. Chantrier Frères, Horticulteurs à Morte Fontaine, sent four fruits of *Diospyros Kaki* (Vntc of Thanks). The Liverpool Horticultural Co., Lmt'd. (Mr. J. Cowan), exhibited two bunches of a black Grape named *Hamburgh-Colmar*, and described as a cross between *Gros Colmar* and *Black Hamburgh*. The Grape appeared very similar to *Gros Colmar*, and the flavour appeared but little better if so good.

BURY ST. EDMUNDS.

NOVEMBER 9.—A *Chrysanthemum* show was held on the above date in the Corn Exchange, Bury, under the auspices of the Bury and West Suffolk Horticultural Society. This is the first held by the Society, but it is expected that it will be continued annually. The success of the exhibition exceeded the hopes of the committee. Mr. E. W. Lake was President, and Mr. W. Armatrong the Hon. Sec. Conspicuous amongst the prize-winners were Mr. G. A. Partridge and Mr. R. Burrell. In all there were twenty-one classes, and these were of the ordinary character, including special classes for groups arranged for effect, for specimen plants, and for cut flowers. A few also were devoted to bouquets, table plants, Primulas, and fruit.

THAMES DITTON.

NOVEMBER 15.—The show of *Chrysanthemums*, &c., of the Ditton Society, held in the Village Hall on the above date, was in advance of that held last year, when the Society was inaugurated. For three trained plants, Mr. W. Mearing, gr. to Mr. W. Whitley, was 1st; and Mr. A. Piper, gr. to Mr. C. Godfrey, 1st for six untrained specimens. Mr. Mearing had the best group for effect; and the same exhibitor, together with Mr. Plowman, gr. to Mr. Laversmith, and Mr. H. Farr, gr. to Hannibal Spear, Esq., was one of the principal exhibitors in the classes for cut flowers. *Cottagera* created a display highly satisfactory, especially such as came from Mr. S. R. Crowne, Boxtrees, Long Ditton, and Mr. Mark Fenn, of Chestnut Villas. At one of the ends of the room was a fine group of *Orchids* from Mr. Taylor, gr. to J. Croyle, Esq., of Ember Grove, Esher, and also a number of *Pelargoniums* and other plants, which added very considerably to the attractiveness of the exhibition.

EALING HORTICULTURAL.

NOVEMBER 15.—A very good *Chrysanthemum*, &c., show was held at the Lyric Hall, Ealing, on the above date. Groups in a space 9 feet by 6 were a pretty feature, and 1st honours were gained by Mr. S. Wickenden, gr. to R. Dawes, Esq., Edmondscote House, with a bold and effective arrangement, this also gaining the National *Chrysanthemum* Society's Silver Medal; 2nd, a good display, Mr. C. Edwards, gr. to W. Owen, Esq., The Elms. In the smaller groups, the 1st prize was gained by Mr. C. Long, gr. to E. P. Oakshott, Esq., with an effective arrangement; 2nd, Mr. W. Harman.

For the best three large-flowered specimen plants, 1st, Mr. S. Wickenden; and Mr. Roberts, gr. to J. Harris, Esq., Braemar, 2nd, both exhibitors contributing well-flowered plants. The successful exhibitors of three *Pompons* were Messrs. C. Edwards and W. G. Rickerd. Table plants were well shown by Mr. Roberts, gr. to J. Harris, Esq.; and Mr. C. Long, who gained the prizes in the order named.

Cut Blooms.—Twelve Japanese. In this class a very fine stand was staged by Mr. C. Edwards, 1st; and one hardly less good by Mr. C. Long, 2nd. Mr. C. Long was 1st for twelve incurves, with neat, well-finished blooms; 2nd, G. Rickerd, gr. to T. Lilley, Esq.

Twelve bunches *Pompons*, very pretty exhibits taking prizes in the order named, were contributed by Messrs. C. Long and C. Edwards. The premier Japanese bloom, *Lord Brooke*, was shown by Mr. C. Long; and the premier incurved was *Violet Tomlin*, shown by Mr. C. Edwards. These prizes (Medals) were offered by the National *Chrysanthemum* Society. Stand of *Chrysanthemums*. 1st, *Misa Savage*, Woodlands; 2nd, W. C. Rose, Esq., Deccan.

Vegetables were well shown by Messrs. Long and Peasey, and culinary and dessert Apples by Messrs. Harman and Woods. The successful exhibitors for black Grapes were Messrs. C. Edwards and G. Rickerd. Non-competitive exhibits were numerous

and good. Mr. C. Holden, florist, Ealing, exhibited a finely-bloomed plant of *Chrysanthemum Scour Melanie*, 28 feet round, and bearing 2000 blooms. Other noteworthy competitors were, Mrs. H. B. Smith, Court florist, very effective floral decorations; Mr. S. Wickenden, group of *Chrysanthemums*; Mr. G. Reynolds, gr. to the Messrs. de Rothschild, group of foliage and flowering plants; Messrs. Hart Bros., florists, Acton, a fine group of *Chrysanthemums*; and a very effective cross, wreath, and chaplet from Mr. W. Bown, florist, Broadway.

LEWES AND DISTRICT.

NOVEMBER 15, 16 A very successful show of *Chrysanthemums*, &c., was held in the new Municipal Building and Corn Exchange, Lewes, on the above dates. A few of the chief winners of prizes on this occasion are given below.

For twenty-four cut blooms, incurved, Mr. Sayers, gr. to Mrs. Cook, Nutley, was 1st; and Mr. Tourle, gr. to F. Barchard, Esq., Little Horsted, was 2nd.

For twenty-four Japanese varieties, Mr. A. F. Grace, of Steyning, was 1st; and Mr. A. Slaughter, was 2nd. Mr. Grace was also awarded a Certificate of Merit, by the National *Chrysanthemum* Society.

For twelve, and also for six Japanese varieties, Mr. Tourle was 1st.

For six incurved, one variety, 1st Mr. A. Slaughter, with Lord Alcester; whilst Mr. Grace was 1st for six Japanese, with good examples of Golden Wedding.

For six distinct Japanese, Mr. Slaughter beat Mr. Grace, and was also 1st for six distinct incurved vars.

Plants.—Mr. C. Funnell, gr. to Mrs. Thorne, Lewes, was 1st, for a group of *Chrysanthemums*; and Mr. E. Brooker 2nd.

A group of stove and greenhouse plants with flowers was badly judged, Mr. C. Watkins, who was placed 1st, being considerably behind Mr. J. Adams, gr. to the Rev. Sir G. Shiffner, Bart.

Mr. J. Carley was 1st for six untrained plants, and Mr. Smith 1st for six Pompons, and again for four standards.

Mr. Denman and Mr. Stidworthy were the winners of the 1st and 2nd prizes, for twelve untrained specimens.

Table decorations were well shown by Miss Adames and Mrs. Stroud, who were 1st and 2nd in each class.

The prize winners for collection of vegetables were found in Mr. Geo. Helman, gr. to Viscount Gage, Mr. C. Watkins, Mr. Grover, Mr. Briggs, and Mr. E. Brooker.

The chief winners in fruit being Messrs. Mercer, Grover, Carley, Richardson, Helman, and Stidworthy.

WINCHESTER CHRYSANTHEMUM.

NOVEMBER 15, 16.—In point of quality, the autumn exhibition held in the Guildhall on the above dates was equal to the average of shows at Winchester. Cut bloom was very good, and Mr. Neville, gr. to F. W. Flight, Esq., Twyford, won 1st prize for thirty-six blooms, half of them to be incurved, and half Japanese. It was an exhibit of a most creditable character; Mr. Brown, gr. to A. B. Welch Thornton, Esq., Beaurepaire Park, was 2nd. Mr. Trinder, gr. to Sir H. Mildmay, Bart., Dogmersfield Park, had the best stand of Japanese varieties. Mr. Hughes, gr. to W. Baring, Esq., had the finest twelve incurved; and Mr. Agate, Havant, the best six of any variety of the Queen family *Chrysanthemum*. Plants of nice proportions, and capitally flowered, were shown by Mr. Can, gr. to W. A. Gillett, Esq. The best group of *Chrysanthemum* plants was arranged by Mr. Broome, nurseryman, Tower Street; and the best group of miscellaneous plants were those from Mr. Can. The Messrs. Flight, Webb & Golding, arranged the most attractive stand of *Chrysanthemums*, foliage, Ferns, and grasses.

Fruit made a very good display; Mr. Hillier, nurseryman, had an attractive non-competitive group of stove and greenhouse plants; and Mr. Molyneux, gr. to W. H. Myers, Esq., M.P., Swanmore Park, Bishop's Waltham, had a grand stand of cut blooms, representative of nearly all the sections of *Chrysanthemums*.

THE ISLE OF SHEPPEY CHRYSANTHEMUM.

NOVEMBER 15, 16.—It says something for the enthusiasm of *Chrysanthemum* cultivators that this corner of Kent, having the sea as a boundary on one side, should be able to hold a *Chrysanthemum* show at all, and bring together some remarkably good blooms. Sheerness, being much engaged in ship-building and naval affairs generally, does not support the *Chry-*

anthemum show as it might and should, but the promoters of the exhibition hold on and hope for a change for the better. The Victoria Hall was well-filled, and looked bright and pleasant—a contrast to the cold and darkness without. One of the principal exhibitors was Mr. A. Radwell, gr. to A. W. Howe, Esq., the President of the Society, and he carried off a goodly number of 1st prizes with plants, cut blooms, vegetables, &c.

The principal cut flower class was for twelve incurved and twelve Japanese; Mr. G. Ray, Sittingbourne, taking the 1st prizes with some capital blooms of both of the former; Lord Brooke, Stanstead White, W. H. Lincoln, Miss A. Hartshorn, and Mrs. C. H. Payne were very fine; and he had excellent incurved. Messrs. W. Ray & Co., Sittingbourne, were 2nd, with blooms only a little inferior.

Vegetables were good. One class was for three heads of Savoy and three stems of Brussels Sprouts, both of which do well in the district. There were some good Apples and Pears, and excellent Potatoes from that well-known Kent grower, Mr. E. Chopping, Milton, Sittingbourne.

We hope the *Chrysanthemum* will continue to flourish in this corner of the garden of England.

TUNBRIDGE WELLS, MID KENT, AND EAST SUSSEX CHRYSANTHEMUM.

NOVEMBER 15, 16 —A very successful exhibition. The more remarkable exhibits were groups of miscellaneous plants, Solanums, specimen *Chrysanthemums* (especially dwarf-trained), and collections of vegetables and Apples. Mr. Charlton had a good collection of vegetables and *Chrysanthemums* in the ante-room; other exhibits not for competition came from Mr. J. Rust, gr. to the Marquis of Abergavenny, Fridge Castle, who had grand fruit in quantity, backed by well-grown plants of *Chrysanthemums*.

Plants.—For eight *Chrysanthemums*, a Silver Cup and a money prize were offered as 1st prize. Mr. J. Smoother gained the honour, with good examples of Val d'Andorre, L'Adorable, Mrs. Forsyth, and others; Mr. W. H. Wickens, gr. to J. Wheelwright, Esq., being 2nd.

For a group of *Chrysanthemums*, arranged on a space 12 feet by 6 feet, a second Silver Cup and a money prize were offered, Mr. H. Nightingale being the winner of the 1st, Mr. Austin of the 2nd prize.

Miscellaneous groups were well represented, and had a very pleasing appearance, the 1st prize going to Mr. J. A. Litter, gr. to W. Wainwright, Esq., for one of the prettiest mixed groups we have seen this season; Mr. L. Dupont, gr. to C. B. Powell, Esq., 2nd. Mr. J. Smoother was 1st for six dwarf-trained plants.

Six plants, Japanese, were also well shown by Mr. Tickner, gr. to H. Hewetson, Esq., while for six bush plants (not disbudded), Mr. J. Tickner, gr. to Mrs. Nelson, was 1st.

Pyramids were good, and those staged by Mr. Tickner and Mr. Smoother well deserved the 1st and 2nd prizes, awarded in like order. A group of *Chrysanthemums* in the amateurs' class resulted in Mr. G. Tickner taking 1st, with a grand lot.

Cut Flowers.—Twenty-four cut blooms, large-flowered incurved, were particularly good, Mr. J. Legg and Mr. J. R. Heasman securing 1st and 2nd prizes respectively. For the same number of Japanese varieties: 1st, Mr. Heasman, and 2nd, Mr. J. W. Moss, with very good specimens. Mr. Legg was 1st for twelve incurved, and Mr. Heasman 2nd. Mr. G. Harriess was 1st for twelve Japanese; Mr. J. W. Moss 2nd.

Six Japanese of any one variety brought some excellent examples of Vivian Morel and Etoile de Lyon from Mr. J. W. Moss and Mr. J. Snow, who won in the order named.

Fruit was good throughout, the chief prizes going to Mr. T. C. Moorhouse, for Grapes; to Mr. F. Bridger, for dessert Pears; Mr. W. Johnstone, for dessert Apples; and to Mr. F. Bridger, for culinary Apples.

Vegetables were very prominent, the best collections coming from Mr. S. Standen, Mr. W. Johnson, and Mr. A. Henderson, who were 1st in their respective classes.

A special prize was offered by Messrs. Bunyard & Co., Maidstone, for twelve dishes, composed of four of dessert Apples, four culinary ditto, and four dessert Pears, and here Mr. F. Bridger was 1st.

PARKSTONE.

NOVEMBER 15, 16.—The first show of the Parkstone *Chrysanthemum* and Horticultural Society was

held in St. Peter's School-room, and was a decided success. Sixty-five classes were included in the schedule, and the general quality of the exhibits and the number of entries was satisfactory. Mr. T. H. Marsh is chairman of committee, and Mr. T. K. Ingram, Hon. Sec.

Groups of *Chrysanthemums* arranged for effect made a very good display. In the leading class, Mr. W. Weeks, gr. to E. N. Blanchard, Esq., and Mr. T. Gould, gr. to Mrs. Dawson Damer, were the most successful competitors.

Cut blooms were also good, Mr. W. Taylor, gr. to Mrs. Elphinstone, Christchurch, was a good 1st for a stand of twelve Japanese, as well as for a like number of blooms of incurved.

Mr. E. Shave, gr. to W. W. Moore, Esq., Bourne-mouth, was 1st for Anemones and reflexed varieties, staging good blooms in each class.

Vegetables were shown remarkably well, and fruit though not present in great quantity was of good merit. Mr. T. K. Ingram, contributed a grand bank of *Chrysanthemums*, &c., from the Parkstone Nurseries, which attracted a good deal of attention, and added greatly to the general effect of the exhibition.

SHEPTON MALLET.

NOVEMBER 16, 17.—The third annual exhibition of *Chrysanthemums*, fruits, and flowers was held in the Town Hall on the above dates. Groups to consist chiefly of *Chrysanthemum* plants made a creditable display. Mr. J. Webb, gr. to Miss Davis, Oakhill, Shepton Mallet, was 1st in the leading class.

Cut Blooms.—Four good stands of twenty-four blooms, twelve incurved and twelve Japanese, distinct varieties, were shown by Mr. W. R. Williams, gr. to J. F. Hall, Esq., Dinder, who was awarded premier position. Mr. J. Webb was a good 2nd.

Fruit was not extensively shown, but what was staged was fine in quality.

Miscellaneous exhibits included seventy-two fine dishes of Apples, eleven good dishes of Pears, and two grand dishes of Medlars from Messrs. Browne & Sons, Priory Nursery, Wells. These were highly Commended, and were very much admired. The Hon. Secretary (Mr. W. H. Allen), and Hon. Treasurer (Mr. R. Norton), deserve a word of praise for the admirable manner in which they arranged and carried out the details of the show.

SHEFFIELD CHRYSANTHEMUM.

NOVEMBER 17, 18.—The exhibition held in the Corn Exchange on the above dates will compare favourably with any held in previous years; and the competition for the handsome prizes offered, brought exhibitors from far and near. Messrs. W. and G. Drover, Fareham, Hants, won the highest prizes for blooms of incurved and also for Japanese varieties, by the flowers possessing fine quality, besides being arranged with good taste.

In the first-named class, Mr. Jellicoe, gr. to F. Goseage, Esq., Camp Hill, Woolton, Liverpool, was a good 2nd; and in the latter, Mr. Heany, gr. to G. C. Schmitz, Esq., Mossley Hill, was 2nd. Mr. Blair, gr. to the Duke of Sutherland, Trentham, was 1st for twelve incurved blooms, as was Mr. Heany for twelve Japanese. Mr. Jellicoe was 1st for six blooms of Japanese and six reflexed. Messrs. Scott and Redmill were the winners of the 1st prizes in the classes confined to the district, with handsome specimens.

In the amateur classes, Mr. Broomhead was quite unapproachable in all classes of cut blooms; and Mr. W. Redmill, gr. to J. G. Lowood, Esq., Five Oaks, Sheffield, staged the best groups of *Chrysanthemums*. Mr. C. Scott, gr. to J. Colley, Esq., Sheffield, had the finest specimen plants of Japanese varieties; and Mr. E. Green had the best plants of incurved varieties—both having those best suitable for the style of training adopted.

THE SUTTON COLDFIELD CHRYSANTHEMUM SHOW.

NOVEMBER 22.—The eighth annual exhibition, held on the above date, was a most successful one. Four excellent groups of *Chrysanthemums* were staged in the open class, Mr. J. E. Pears, gr. to J. D. Ripplingill, Esq., Manor Hill, winning with a beautiful group of well done plants in foliage and quality of bloom; and 2nd, Mr. R. Popwell, gr. to W. H. Tonks, Esq., Sutton Coldfield, with a well-arranged group.

With specimen plants in pots, Mr. Pears was well

to the front with capital naturally trained cut-back plants of considerable size and exceptional merit.

In the class for twenty-four blooms, twelve incurved and twelve Japanese, Mr. A. Hughes, gr. to W. L. Hodgkinson, Esq., Erdington, was 1st, with good blooms; 2nd, Mr. A. Jenkins, with a good selection.

In the class for twelve blooms, six of each class, Mr. Pears was again 1st with a good lot; 2nd, Mr. A. W. Wills.

Some good Apples and Pears and vegetables were exhibited.

It is an unusual thing to see prizes offered for a collection of fungi, but it is so annually here, and two good collections were staged by men employed on the railway.

Mr. A. W. Wills, J.P., sent, not for competition, some good Orchids; Mr. H. E. Yates, a good panful of *Calanthe vestita*; and Mr. Groves, nurseryman, Sutton Coldfield, a fine bank of *Chrysanthemums* and other plants, and a good display of cut blooms.

NEWCASTLE FLOWER SHOW.

NOVEMBER 23.—The annual meeting of the Durham, Northumberland, and Newcastle-upon-Tyne Incorporated Botanical and Horticultural Society, took place at the offices of the Society, Cross House Chambers, Westgate Road, Newcastle, on the above date, Mr. Nathaniel Armstrong presided, and there was a good attendance. The following is taken from the annual report:—Your Council announced in the report of last year that it had made arrangements for amalgamating the summer show with that of the Northumberland Agricultural Society, believing that by so doing the finances of both would be materially benefited; the result has quite justified the course pursued. Owing to an unusual spell of fine weather, extending over the three days, the takings at the gates reached the large sum of £2183 3s. 9d., this Society's proportion being one-third, or £727 14s. 7d., and it is gratifying to know that the balance in hand is £824 7s. 11d. It is proposed in future to hold the summer show in the Recreation-ground, North Road, instead of the Leazes Park, as it is more convenient, and centrally situated.

It was announced that the shows for 1894 have been fixed to be held on April 18 and 19 (spring), and July 18, 19, and 20 (summer). The balance-sheet, presented by Mr. J. A. Baty (treasurer), showed that during the year £800 had been invested in deposit shares in the Tyneside Assets Purchase Company, and there remained in the bank £24 7s. 11d. The subscriptions amounted to £502 5s. 6d., and the receipts from the spring and summer shows to £921 2s. 4d. The balance in hand had increased during the year from £412 5s. 6d. to £824 7s. 11d., £332 16s. had been expended in prizes, £70 in fireworks, and £83 6s. in "music, fares, and expenses."

Councillor Fox moved the adoption of the reports. Mr. B. Cowan, of South Shields, seconded, and congratulated the meeting on the condition of the Society.

The report having been carried, Mr. Edward Joicey, J.P., was elected president of the Society, and the Mayor of Newcastle (Ald. Quin) vice-chairman.

It was stated that the spring show of the Society would be held in the Olympia instead of the Town Hall.

Mr. Armstrong asked if it was not possible to hold a *Chrysanthemum* show in Newcastle as in the case of Gateshead and Shields. He would suggest that one be held next year.

Mr. Cowan agreed with the idea of a show, but thought that it should be arranged outside the Society, as there might be a difficulty in increasing the price of subscriptions, &c., of the Society.

There appeared to be a feeling in favour of the holding of such a show, but whether under the Society or not was not decided. Eventually the matter was referred to the council.

The meeting concluded with a vote of thanks to the chairman.—*Newcastle Daily Leader*.

SCOTLAND.

NORTH OF SCOTLAND HORTICULTURAL AND ARBORICULTURAL ASSOCIATION.

The members of this Association held their monthly meeting in the Christian Institute, Aberdeen, on Wednesday, the 15th inst. There was a good attendance, and Mr. John Munro, of the Polmuir Nurseries, occupied the chair. The feature of the evening was

an exhibition of what was described as "novelties of the year." It consisted of the best specimens of flowers, fruit, and vegetables, grown by the exhibitors. A few facts concerning the treatment given to each of the specimens were given by the various exhibitors, among whom were Mr. Grigor, Mr. Harper of Duthie Public Park, Mr. William Reid, and several others. The proceedings proved very instructive and enjoyable. Mr. J. Crighton, Balmagath, afterwards read a paper on the rearing of that most charming of all autumn-flowering plants "*The Chrysanthemum*," in which he gave some valuable hints and information. A collection of beautiful *Chrysanthemums* were on exhibition, and were much admired. The lots shown represented two distinct methods of culture, the largest bloom, grown by Mr. James Crighton, gr. to Mr. Collie, Balmagath, Cults, having four blooms on a plant, while fifteen to twenty of the smaller blooms were grown on a single plant. These latter were grown by G. Ross, gr. to Mr. D. McHardy, Cranford, Mansfield. One of Mr. Crighton's specimens measured 32 inches in circumference. Cultural Certificates were awarded to Mr. J. Crighton and Mr. Ross, Cranford, for *Chrysanthemums* and Orchids. After an interesting discussion the proceedings were brought to a close with the usual votes of thanks.

Obituary.

JOHN DANIELS.—We regret to announce the death of this gardener, formerly at Swyncombe Gardens, Henley-on-Thames, and which took place near the latter town on November 1. Mr. Daniels had attained the age of seventy-seven years. It may be remembered that he gained a great reputation as a successful cultivator of *Bougainvillea spectabilis*, and for flowering sprays of which he was in the year 1860 awarded the Silver Medal of the Royal Horticultural Society. At that time, and for a few years previously, and for many years subsequently, he used to flower this magnificent plant in a large greenhouse, quite 400 square feet of glass being covered with its growths, and it would have covered more space if the terminal shoots could have extended further. The plant at Swyncombe was planted with its roots in proximity to the boiler, and the boiler projecting through to the inside of the house, made the end very hot, so that plants near it were attacked by red-spider, scale, &c., but it suited this plant exactly, as no insect except the green-fly infest the *Bougainvillea*. Later in point of time, Mr. Daniels had reason to think the roots had penetrated far beyond the restricted space originally allotted them, and to this fact he owed in some measure the wonderful vigour and floriferousness of this plant.

Mr. Daniels was born at Kniveton, near Aahbourne, Derbyshire, in the year 1816, and while quite a child he was placed with a nurseryman of the neighbourhood, who, perceiving in the lad marked ability, and trustworthiness of character, would send him away when quite young with a gang of men to lay out estates and effect improvements in pleasure-grounds. Here he remained for something like seven years, after which he became second gardener at Swithland Hall, in the county of Leicester, after three years service he became head gardener at Shenton Hall in the same county. Thence he went to Elsenham Hall, in Essex, where he remained for a period of nine years, and left in consequence of the death of the then owner of the estate, George Rush, Esq. In the year 1850 he went to Swyncombe Park to take charge of the gardens, and eventually of the estate, and here he remained as gardener to the Rev. C. E. Ruck-Keene, and to his son and successor, Major Ruck-Keene. In addition to cultivating the *Bougainvillea* with so much skill, he designed and planted a pinetum, which is filled with choice specimens. He improved the estate in many directions, and always with marked success, and the spring garden years ago was, perhaps, the best in the county, while in the woods he planted and naturalised many things of an extremely interesting character. About eighteen months ago he retired on a pension, living near the scene of his former work, and died as above stated.

His services were much in request as a judge at Oxford and elsewhere. A daughter living near Swyncombe survives him. *R. D.*

H. G. QUILTER, who died on November 23, at Felixstowe, aged seventy, was at one time a very prominent figure in matters horticultural. To our older readers he was well known in connection with the highly successful provincial show of the Royal Horticultural Society, held at the Lower Grounds, Birmingham, in June, 1872, which was opened by H.R.H. the Duke of Connaught, and resulted in a net profit of more than £2000. But Mr. Quilter won his spurs in outdoor-gardening previously by his enthusiasm and success in developing the late John Fleming's ideas of "Spring Gardening" (first displayed at Cliveden for the delectation of the famous Duchess of Sutherland, and afterwards carried to the highest pitch of perfection by Mr. Quilter at the Lower Grounds). The spring-bedding at the Lower Grounds, carried out in a most consistent though lavish manner for many successive years, showed residents in the Midland Counties how capable Mr. Fleming's ideas were of giving, at comparatively small cost, a most beautiful display of hardy flowers at the season when they are most rarely seen, and, consequently, most desired. Mr. Quilter was a great enthusiast in this matter, but he was also a good man of business. He had living close to him a huge population, who only needed something deserving attention to attract them, and he provided an outdoor entertainment of the most attractive kind, which drew them to the Lower Grounds in hundreds of thousands; and it is no extravagance to say that his display of "Spring Gardening" did more to make it popular than the efforts of any other man. He was seconded in his efforts by Mr. Fleming afore-named, Mr. Philip Frost of Dropmore, Mr. Peter Barr, and others. Subsequently he tried to develop other ideas at the Lower Grounds, which involved the building of a costly aquarium and theatre. These were peculiarly unsuccessful, and a large amount of capital was lost. Mr. Quilter then removed to the Bath Hotel at Felixstowe on the east coast, where he developed a large business, continued his gardening practice, and was mainly instrumental in promoting the development of that favourite watering place. He died, after a short illness, on November 23 last.

ISAAC DIXON.—We regret to announce the death of Mr. Isaac Dixon, who for upwards of thirty years had been with Messrs. Chas. Lee & Sons, Hammersmith, as Manager of their Feltham nursery. He travelled for the firm during nearly twenty years, and was consequently well-known and as much respected. He was on his journeys in the West of England, and having taken a chill was obliged to return home from Bath, and after a fortnight's illness, died on November 18, aged 58. The funeral took place on Saturday last at Feltham.

MR. HOWARD.—We regret to announce the death, at the age of fifty-eight years, of Mr. Howard, on November 27, at Southgate. He was well-known as a grower for Covent Garden Market, and previously as a gardener to E. Brand, Esq., Bedford Hill, Balham, where he gained considerable reputation as a cultivator. At the International of 1866, Mr. Howard caused a sensation by his exhibit of three or four magnificent specimens of *Eucharis*, shown in tubs 5 feet in diameter. At that time the *Eucharis* was a novelty. Mr. Howard was an enthusiastic supporter of the Gardeners' Orphan Fund and other charities.

EXCHANGE.

MR. W. S. LEE, Summerhouse, Woodseate, Sheffield, wishes to exchange three bound volumes of the *Gardeners' Chronicle*, from 1841—1843 inclusive, for other books on gardening.

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

MESEMBRYANTHEMUM.—The director of the Botanic Garden, Zurich (Professor Dr. Hans Schinz), is anxious to procure, by purchase or otherwise, one or more species of *Mesembryanthemum* of the section *Sphæroidea*, such as *M. obconellum*, &c.

MARKETS.

COVENT GARDEN, November 30.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

PRICES rule as last week.

POTATOS.

Supplies during the last few days have not been quite so heavy, and in consequence the market prices have had a tendency to harden. J. B. Thomas.

SEEDS.

LONDON: Nov. 23.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that the most interesting feature of the past few days has been a sudden demand for American Red, many cartloads of which have just found buyers here at the tempting rates current. There is no change in either Alsike, White, or Trefoil. Ryegrasses are neglected. Canary-seed is 1s. dearer. Hempseed continues cheap. Canadian Luseed is firm. There is nothing new in respect of either Haricots or Peas. Spring Tares are in fair request.

FRUITS AND VEGETABLES.

BOROUGH: November 28.—Quotations:—Cabbages, 2s. 6d. to 5s.; Cauliflowers, 4s. to 6s.; Savoys, 3s. to 6s. per tally; Turnips, 1s. to 1s. 6d.; Carrots, 2s. to 3s.; Parsley, 2s. to 3s. 6d. per dozen bunches; Onions, 5s. to 6s. 6d. per bag; Apples, 1s. 3d. to 6s. per bushel.

SPITALFIELDS: November 28.—Quotations:—Cabbages, 2s. 6d. to 3s.; Savoys, 3s. to 6s.; Cauliflowers, 4s. to 6s. per tally; Turnips, 1s. to 1s. 6d.; Carrots, 2s. to 3s.; Parsley, 2s. to 3s. 6d. per dozen bunches; Onions, 5s. to 6s. per bag; do., English, 5s. 6d. to 6s. 6d. per cwt.; Apples, 1s. 3d. to 6s. per bushel.

STRATFORD: Nov. 28.—Quotations:—There has been a good supply of all kinds of produce at the above market during the past week, and a brisk trade has been done at the under-mentioned prices:—Cabbages, 1s. 6d. to 2s. 9d. per tally; Savoys, 1s. 9d. to 3s. 9d. do.; Greens, 1s. to 1s. 3d. per bag; Cauliflowers, 2d. to 1s. 3d. per dozen; do., 3s. to 7s. per tally; Turnips, 1s. 2d. to 1s. 9d. per dozen bunches; do., 20s. to 40s.

per ton; Carrots, household, 40s. to 50s. do.; do., cattle-feeding, 25s. to 35s. per ton; Parsnips, 8d. to 1s. per score; Mangels, 22s. to 26s. per ton; Swedes, 22s. to 27s. per ton; Onions, English, 150s. to 165s. do.; do., Dutch, 6s. to 6s. 6d. per bag; do., Valencia, 6s. to 6s. 6d. per case; Apples, English, 2s. to 5s. per bushel; Brussels Sprouts, 1s. 3d. to 1s. 6d. per half-sieve; do., 2s. 3d. to 2s. 6d. per bushel; Celery, 8d. to 1s. per roll; Horseradish, 1s. to 1s. 6d. per bundle.

FARRINGTON: Nov. 30.—Quotations: Celery, 8s. per dozen; Cauliflowers, 1s. to 1s. 3d. per dozen; Horseradish, 1s. 3d. per bundle; English Onions, 6s. 6d. to 7s. 6d. per cwt.; case Onions 6s. 6d. per case; Sprouts, 1s. 6d. per half-bushel; cooking Apples, 4s. per bushel; Blenheim, 6s. 6d. to 7s. per bushel; Grapes, 1s. to 1s. 6d. per lb.; Almeria, 10s. 6d. to 12s. 6d. per barrel; Tomatos, English, 5d. to 7d. per lb.

POTATOS.

BOROUGH AND SPITALFIELDS: November 28.—Quotations ranged in price from 35s. to 100s. per ton.

STRATFORD: Nov. 28.—Quotations:—Magnums, dark-land, 35s. to 42s. 6d.; do., light, 40s. to 60s.; Bruces, 45s. to 65s.; Sutton's Abundance, 60s. to 75s. per ton.

FARRINGTON: Nov. 30.—Quotations:—Hebrons, 80s. to 100s.; Magnums, 40s. to 60s.; Snowdrops, 70s. to 90s.; Main Crop, 60s. to 90s.; Regents, 50s. to 70s. per ton.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 149s. to 151s.; new, do., 125s. to 145s.; inferior, do., 100s. to 120s.; Hay, best, 145s. to 170s.; inferior, do., 90s. to 100s.; new Mixture, 115s. to 130s.; and Straw, 35s. to 55s. per load.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fabr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

- 0, Scotland, N. Principal Wheat-producing Districts:— 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S.
- Principal Grazing, &c., Districts:—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending November 25, is furnished from the Meteorological Office:—

"The weather was exceedingly changeable, with frequent showers in most districts. Severe northern gales occurred over the United Kingdom generally at the commencement of the week, and slight gales on one or two subsequent occasions.

"The temperature was below the mean in all districts, the deficit being least (1°) in 'Ireland, N.,' and greatest (4°) in 'England, S. and S.W.,' 'Ireland, S.,' and the 'Channel Islands.' The highest readings were observed as a rule on the 25th, when the thermometer rose to between 51° and 53° in most districts, and to 54° in 'Ireland.' The lowest readings which occurred at various times in different parts of the country ranged from 20° in 'Scotland, E.,' and 22° in 'Ireland, N.,' to 28° in 'England, N.W.,' and to 35° in the 'Channel Islands.'

"The rainfall was less than the mean in most districts, but about equal to it in 'England, N.E.,' and in excess of the normal in 'England, E. and N.W.' Snow fell in many parts of the United Kingdom on the 19th, and again in several of the western and northern districts on the 22nd and 23rd. "The bright sunshine was in excess of the mean in most of the grazing districts, but about equal to it or a little below the mean in the Wheat-producing districts. The percentage of the possible duration ranged from only 5 in 'Scotland, N.,' to 25 in 'Scotland, W.,' 29 in 'Ireland, N.,' and 38 in 'England, S.W.'"

* * Numerous Communications, Reports, &c., are unavoidably held over.

BEGONIAS FROM SELF-FERTILISED FLOWERS: *Begonia*. The colours are fairly constant.

BEGONIAS, VARIETY OF COLOUR IN SEEDLINGS RAISED FROM ARTIFICIALLY-FERTILISED BLOOMS: *Begonia*. Having regard to the great variety of the crosses you have made, we think that you are likely to get as good a selection of colour in the blossoms as if you had bought seeds.

BEGONIAS: *Subscriber*. The tubers should not be potted, but kept like Potatoes—that is, not perfectly dry. There should be some slight dampness about, such as would be found on an earthen floor in a cool cellar, or in a potting-shed. The tubers keep pretty well in boxes of sand several layers thick. Sawdust is a bad material to plunge them in, as in certain conditions of moisture it favours the growth of fungus or mouldiness, and when kept very dry, it would absorb the juices of the tuber; these latter may be potted and started in the latter end of March, in a temperature of 55° to 65°.

CHRYSANTHEMUMS: *Dartford*. We cannot undertake to name florists' flowers. Send them to some grower of these plants.

CELOGYNE CHISTATA: *T. P. W.* Probably the cool end of your Cattleya-house is not warm enough for *Celogynes* just as they are pushing forth their flower-spikes. Could you not afford them a somewhat warmer place, affording them but little aerial moisture, and not much at the root?

CUCUMBER ROOTS: *Constant Reader*. The little knobs on the roots are full of "eel worms," so often described and figured in these columns. Burn the plants, get fresh soil, and start afresh.

EARL'S COURT EXHIBITION OF 1893: *Exhibitor*. We know nothing whatever of the affairs of this venture, and cannot, therefore, answer your request for information about the distribution of prize-money.

ELECTROS: *D. T.* We cannot inform you; nor do we, as a rule, dispose of our electros.

FRUIT DRIVING: *B. R.* See *Journal of Royal Horticultural Society*, 1890, p. 532.

GLADIOLUS AND DAHLIA: *Subscriber*. The former should be taken from the ground, and removed to a cool, dry cellar, with just what soil hangs to them. Do not clean off the "brood," or cut the tops. The latter should be cut off at 6 inches high, and be dug up without injuring the tubers. Do not use the stalk to pull them by, nor wrench the tubers from the rootstock. Pick off the soil, and stand them in an airy place for twenty-four hours before placing them also in the cellar. Be sure that the frost does not get at them, and if the cellar is very dry, or frost likely to enter it, lay the roots in sifted coal-ashes or dry soil.

HELIANTHUS SOLEIL D'OR: *Wirbhorn*. The same as *H. multiflorus* var. *grandiplenus*. We do not know the name of the raiser.

MICROSCOPICAL WORK: *B. R.* Apply to the Science and Art Department, South Kensington. We do not know anyone who gives private instruction in this subject.

NAMES OF FRUITS: *T. P. W.* The large Pear is Catillac, and the smaller Glou Morceau—*J. S.* Glou Morceau.—*J. W. 3.* Adams' Pearmain—others appear to be local sorts unknown to us; 4, Pear Poire Gendron.—*E. L. H.* 1, May, probably, be Annie Elizabeth; 4, Col. Vaughan; 5, 6, Golden Nonpareil; others not known.—*L. S. W.* Pear Knight's Monarch.

NAMES OF PLANTS: *A. C. 1.* Cupressus Lawsoniana; 2, Eucalyptus pungens; 3 Cupressus Lawsoniana; 4, Thuja gigantea; 5, Juniperus virginiana; 6, Cupressus (Retinospora) obtusa.—*P. H. D.* 1, a form of Retinospora plumosa of gardens; 2, Juniperus taxifolia; 3, a form of Retinospora plumosa of gardens; 4, Cupressus Lawsoniana; 5, Retinospora filifera; 6, a form of Retinospora plumosa of gardens.—*T. S. M.* Basella alba.—*Jos. T.* We have often stated that we do not undertake to name florist's flowers, send them to some grower.—*G. W.* Hakea laurina.—*T. A. D.* 1, Croton Johannis; 2, Xylobium latifolium; 3, Anthericum lineare variegata.—*S. B. L.* 1, Lycaste leucantha; 2, Cymbidium sinense.—*P. & Son.* Ansellia gigantea.

NARCISSUS BULBS: *W. K.* The grub found in the centre of the bulbs is that of the Narcissus-fly, Merodon Narcissi. You can do nothing beyond destroying all affected bulbs by burning them.

ONCIDIUM UNICORNE: *T. P. W.* This plant, as regards the flower, does not resemble *O. concolor*, as you seem to suppose. It is figured in *Bot. Mag.*, t. 3109. Panicle thin, straggling; flowers small, pale yellow.

PEACH TREE DYING OFF AT THE ROOT: *G. H. C.* The roots may have got into bad soil, or something that was injurious to the roots. It may be a case of loss of health from age; we cannot say without knowing more than you tell us about the tree.

PEAR SCALE ON BUSH TREES: *Subscriber.* It can be got rid of by the common cheap remedy of coating every branch and twig with a suffocating mixture of soft-soap, lime, sulphur, cow-dung (to make it stick), and soot to darken it. Put on as a thick paint with a brush, or as a thin wash that will pass through the nozzle of the garden engine, in that case doing it twice or thrice. A wash of Gishurst's Compound Soap, at the rate of 4 oz. to a gallon of hot water, is a good remedy, and a safe one if used before the middle of the month of February, but it must be used with a hard brush.

PLAGIARISM: *P. M. O.* The charge is not made out. At p. 151 you will find adequate acknowledgment.

POTATOS FROM ZAFFRA: *J. A. C.* Scotch Champion, largely cultivated in Ireland and the North some years ago, but of late years it has almost gone out of cultivation in this country, although still more or less grown in Ireland and Scotland.

PROTECTING SMALL FRUITS FROM BIRDS BY MEANS OF A PERMANENT FRAME-WORK OF GAS PIPING AND WIRE-NETTING: *W. C.* It answers every expectation, if you admit the birds at seasons when they do not destroy the buds or eat the fruit.

RATING OF NURSERY AND MARKET GARDENS: *P. & Sons.* The assessment is in respect of one-fourth of the nett annual value, but this does not apply to the poor-rates. See *Gardeners' Chronicle*, May 21, 1887, p. 676.

SIX NEW BORDER CARNATIONS: *Jersey.* Pride of Great Britain, yellow; Duke of York, crimson, clove-scented; Duchess of Eife, fine flower, rosy-pink; Horace, daz'ling scarlet; Ketton Rose, deep pink; White Dame, pure white, strongly fragrant. These are new varieties, shown by Mr. T. Ware.

COMMUNICATIONS RECEIVED.—Dutch Horticultural Society. *W. R.*—*E. W. F.*—*W.* and *J. B.*—Prof. Oudemans, Amsterdam.—*T. H. C.*—*G. Subrai*, La Mortola.—*H. T.*—*C. W.*—*J. H. B.*, Utrecht.—*T. D. MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus, Will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kinds of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price, 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

May 27, 1893, The Dell, Englefield Green, Surrey.
ROBERT WARNER & Co., Engineers, 27, Jewin Crescent, E.C.
Dear Sirs,—It affords me much pleasure to inform you the 25 ft. Annular Sail Windmill, on 40 feet timbers, working a set of 3 in. x 9 in. stroke treble pumps, that you fixed here for Baron Schröder, is giving very great satisfaction, pumping the water through 4,224 feet of pipe, to a vertical height of about 80 feet. I must also express my thorough appreciation of the manner in which the whole of the work has been so successfully carried out.—Yours faithfully,

H. BALLANTINE, Head Gardener to Baron Schröder.
We have a similar Mill and set of Pumps in hand for Lord Northbourne.

SPECIAL NOTICE.

I RESPECTFULLY beg to inform all readers of this paper that my Revised Price List, elegantly bound in cloth, gold lettered front, consisting of 400 pages, with about 1,200 Illustrations, is Now Ready. I shall have much pleasure in forwarding, upon receipt of One Shilling, a Copy, post free, of one of the most Complete and Descriptive Lists of Horticultural and Garden Requisites, and also Poultry Appliances, extant.

GREENHOUSE DEPARTMENT.

THE AMATEUR FORCING HOUSE. TENANT'S FIXTURE (Span-roof).

These houses are offered at an exceedingly low rate, and should be readily approved by both amateur and professional gardeners, as brickwork, which is very expensive to a small house, is entirely dispensed with.

The utility of such a house for forcing or cultivating Cucumbers, Tomatos, Melons, &c., will be perceived at a glance, it being a structure constantly in request but almost hitherto unknown.

Specification.—Framework substantially constructed of red deal; the whole of sides, and 2 ft. 6 in. of ends, boarded with well-seasoned tongued and grooved matchboards. Half-glass door, complete with rim lock and brass fittings, in one end; glass 16 oz. throughout, English cut. Ventilators supplied according to size of house, and stays necessary for opening same; stages for plants each side of house, all woodwork painted one coat of good oil paint, and the whole structure securely packed and placed on rail.

Lot.	Length.	Width.	Height.	Packed on rail.	Sale Price.

SPAN-ROOF FORCING HOUSE.

The illustration shown will convince all practical minds of the importance and utility of this class of house for Gentlemen, Nurserymen, Market Gardeners, and all those who require a cheap strong House for Forcing, or growing Cucumbers, Tomatos, Melons, &c.

Specification.—Built for brickwork, 3 feet high, of thoroughly well-seasoned red deal; roof ventilation according to size; door at one end; all 21-oz. glass; painted one coat.

"AMATEUR" SPAN-ROOF AND LEAN-TO GREENHOUSES.

TENANT'S FIXTURES.

Made especially for Amateurs at a nominal figure, thereby coming within reach of those who require a strong but inexpensive structure, and being constructed in complete sections, are erectable by any handy-man or gardener in a few hours. Framework is substantially constructed of red deal, the lower part being filled in with well-seasoned tongued and grooved matchboards. The house is fitted with door complete, with rim lock and brass furniture, painted one coat of good oil colour, supplied with all necessary ironwork and stages for each side, and good 16oz. glass throughout. All parts securely packed, and put on rail.

SPAN-ROOF VILLA CONSERVATORIES.

Adaptable for the lawn of a villa residence, being well and substantially-built, constructed of the best materials, and artistically finished, with diagonal panels and barge-boards. The framework is composed of 2 in. by 3 in. red deal, the lower part doubly-lined with tongued and grooved matchboards, and the roof properly fitted with sashes, which facilitates fixing or removing of same without disturbing glass.

The houses are fitted with a half-glass door, complete with rim lock, brass fittings and key, and is supplied with lattice staging for each side, footpath the entire length; gutters, down pipes, suitable ventilators, and necessary ironwork for opening same.

All woodwork painted two coats of good oil paint, glass cut to sizes, and all parts securely packed on rail. Prices:—

WILLIAM COOPER'S SEVENTH ANNUAL CLEARANCE SALE.

CONTINUED FROM PRECEDING PAGE.

MELON AND CUCUMBER FRAMES.

These are very useful Frames, being suitable for the storage of plants in winter, and well adapted for the cultivation of Melons, Cucumbers, &c., in summer. (The illustration shows a Three-Light Frame, 12 ft. long, by 6 ft. wide, height at front 11 in., and height at back 22 in.) They are composed of 1 1/2 in. thoroughly well-seasoned, tongued and grooved boards, have necessary Parting Pieces, and runners for the Lights, which are 2 in. thick, and which are glazed with good 16 oz. glass, nailed and bedded in oiled putty, and fitted with an iron handle. All parts painted three coats of good oil paint, and securely packed and put on rail at the following prices:—

Several dozen Odd Lights, New and Second-hand, at any price, to clear. Send requirements or call.

GARDEN HAND FRAMES.

The e Frames will be found to be very useful for protecting plants, seeds, slips, and cuttings, during the spring, which, if left uncovered, would probably fall victims to the extreme cold so prevalent in this country during that season. Zinc open tops, with glass cut to sizes, and zinc clips for glazing same.

POULTRY APPLIANCE DEPARTMENT.

NEST BOXES.

LOT 1030 to 1241. This is a popular method of sitting hens, and should be universally adopted. The bottom is of wire netting, made concave, so that eggs are left unovered by the hen; it is also a protection against rats burrowing into the nest. These boxes are constructed of thoroughly well-seasoned tongued and grooved match-boards, painted outside once coat of good oil paint, complete with handle; size, 1 ft. 8 in. high, 1 ft. 4 in. wide, 1 ft. 3 in. deep. Securely packed and put on rail at the following respective prices:—
 Usual price, 4s. each. Sale price, 3s. each; 6 for 16s. 6d., 12 for 30s.

MOVABLE POULTRY HOUSES. (Span-Roof.)

These Houses are pretty in appearance. They are substantially constructed in sections (in complete readiness for fixing together with facility) of well-seasoned tongued and grooved match-boards; supplied with door, complete with lock, ventilator slide and painted outside one coat of good oil paint. Packed and put on rail at the following respective prices:—

Lot.	Usual Price.	Sale Price.
897 to 921—5 ft. long, 4 ft. wide, 6 ft. high, 3 ft. 6 in. to eave ...	25s.	20s.

HEATING APPARATUS DEPARTMENT.

COOPER'S HYGIENIC HEATER.

Burning Paraffin or Gas without smoke or smell. These Heaters are constructed as a means of Heating by Hot Air without the use of hot water or fires. Its peculiar construction economises the heat generated, so that there is no waste of heat or fuel. There being perfect combustion in the stove, and nothing whatever injurious to plants, but actually everything conducive to their health, it should be observed that plants may be had in full bloom throughout the severest winter. This cannot be obtained in stoves of other systems. See list for full description.

2058 to 2069—No. 5 ...	5	2 10 0	4 0 0

THE RAPID PROPAGATOR.

The only perfect Propagator for raising Plants from Seeds, Slips, or Cuttings.

This Propagator is the best and cheapest now before the public, and will be found especially serviceable to Amateurs and Gardeners who require to strike cuttings and raise seeds in a short space of time.

One of these Propagators will raise large quantities of plants in the spring; thus, to a great extent, dispensing with the necessity of striking cuttings in the autumn, it being well known that many cuttings fall victims to the frost and damp atmosphere so prevalent in this country. This method of propagating saves the trouble and annoyance resulting from the loss of so many plants in the winter time, and also makes it unnecessary to occupy so much space in storing a large quantity of cuttings.

These Propagators are composed of an outside casing, with movable sheets of glass on top. The bed or bottom is formed of a tank, in which a constant circulation of hot-water is kept up by the Heater (see illustration), the pots being plunged in a bed of Cocoa-nut fibre refuse, which should be kept moist. It is heated by oil, one pint of which will burn at least thirty hours. Securely packed (no charge for packing), and put on rails complete, at the following sizes and prices:—

Lot.	Usual Price.	Sale Price.

WILLIAM COOPER'S SUNSHADE.

Superior to all other preparations of the kind. The cheapest, most efficient, and convenient preparation for shading greenhouses, conservatories, glass roofs, and windows of all descriptions. Is applied cold—an enormous advantage over preparations requiring to be used whilst hot. May be used either inside or outside, and produces a pleasing effect. Is not washed off by rain, but can be instantly removed when desired by rubbing over with a brush whilst it is wet. Made in various colours—White, Pale Blue, and Pale Green. Usual prices: in tins: 1 lb., 1s.; 2 lb., 2s.; 7 lb., 5s. Sale prices: 1 lb., 4d.; 2 lb., 8d.; 7 lb., 2s.

COOPER'S WONDERFUL NEW MUSHROOM SPAWN.

From many year's experience I believe this brand of Spawn to be the very best procurable—fresh; very best quality, producing abundant crops of Superior Fleshly Mushrooms. Usual price, 4s. per bushel. Sale price, 2s. per bushel.

INSTRUCTIONS.

Mushrooms may be grown in a warm cellar or shed in winter, or in the open air in summer. Take partially dry, fresh horse-manure and lay it in a heap to ferment, turn and mix it well every few days, and when well and equally fermented, which will be in from ten to fifteen days, it may be made into a bed 4 feet wide and about 2 feet deep, mixing it well together, and beating or treading it firmly. As soon as the temperature of the bed fall from 75° to 80°, the spawn may be inserted in boxes about the size of a walnut, about 2 inches deep and 6 inches apart. Cover with leamy soil about 2 inches deep, and beat it down evenly and firmly, placing a garden mat over the bed. Water when necessary with lukewarm water, and expect Mushrooms in from four to six weeks.

WILLIAM COOPER'S GENERAL FERTILIZER.

FOR FLORISTS, GARDENERS, and AMATEURS. This high-class Manure is strongly recommended for all kinds of Flowers, Fruit Trees, and Vegetables, and will be found invaluable, both for improving and increasing the Produce. SUITABLE FOR ALL CROPS. POTATOS, KITCHEN GARDEN PRODUCE, VINE, FRUIT TREES, ROSES, POT PLANTS, &c. Usual Price: Tins, 4s.; 7-lb. bags, 1s.; 14-lb. bags, 2s.; 28-lb., 4s.; 5-cwt., 7s.; 1-cwt., 13s. Sale Price: Tins, 3d.; 7-lb. bags, 9d.; 14-lb. bags, 1s. 6d.; 28-lb., 3s.; 5-cwt., 6s.; 1-cwt., 10s.

SILVER SAND (COARSE OR FINE).

2-cwt. sacks. Usual price, 3s. 3d.; sale price, 2s. 3d. Special offer. Four-ton truck on rail at pit loose, 20s.

BEST COCONUT-FIBRE REFUSE (FRESH AND CLEAN).

9d. per sack; 10 sacks, 7s.; 15-sacks, 10s.; 20 sacks 12s. 6d.; 30 sacks, 18s. Sacks included. Truck-loads, free on rail over 2 tons, 50s. Moistens in Heat. Holds Heat in Winter. Invaluable for Pottings, Planting, Forcing, Decorating; and used on Strawberry beds is preferable to straw, keeping the Fruit clear from rot, and at the same time nourishing the Plants. For lightening heavy soils it is particularly useful, and when the soil is light and dry, it is of great advantage as a mulch. All slugs and insects are destroyed by its use. As I have not a great quantity of this in stock, and not being able to replace at the price, I will, if not instructed otherwise, send other goods to value should it be all sold before I receive your order. First come, first served.

SPECIAL OFFER TO THE TRADE

100 tins Sunshade and 100 tins Fertilizers, to retail at 4d. and 6d. each. 50s. on rail.

DR. SMILES'S WORKS.

LIVES OF THE ENGINEERS. Illustrated by 9 Steel Portraits and 342 Engravings on Wood. 5 vols. Crown 8vo. 7s. 6d. each. 1. VERMUYDEN, MYDDELTON, PERRY, BRINDLEY. 2. SMEATON and RENNIE. 3. METCALF and TELEFORD. 4. BOULTON and WATT. 5. GEORGE and ROBERT STEPHENSON. [The volumes may be had separately.]

"We cannot but refer to the captivating and instructive volumes which Dr. Smiles has devoted to the 'Lives of the Engineers,' a record not before attempted of the achievements of a race of men who have conferred the highest honour and the most extensive benefits on their country."—Edinburgh Review.

LIFE OF GEORGE STEPHENSON. With Illustrations. 21s.; 7s. 6d.; or 2s. 6d.

"We have read this book with unmingled satisfaction. We hardly ever remember to have read a biography so thoroughly unaffected. . . . It is an artless attempt to set out the character and career of one of the most ingenious, honest, resolute, homely, and kind-hearted of human beings. The entire style of the work is unambitious, lucid, thoroughly manly, and good."—Saturday Review.

JAMES NASMYTH, ENGINEER: AN AUTOBIOGRAPHY. Illustrated. 6s.

"The whole range of literary biography may be searched in vain for a more interesting record of an active, useful, successful, and happy life, than is presented by the delightful autobiography of James Nasmyth."—Edinburgh Review. A few copies of the large paper Edition, with Portrait etched by RAJON, 8vo, 16s., may still be obtained.

JASMIN: BARBER, POET, PHILANTHROPIST. Post 8vo. 6s.

"What Jasmin did for himself in poetry Dr. Smiles has now done for him in prose, doing full justice to that part of his life which Jasmin's simple modesty forbade him to record, namely, his unceasing philanthropic efforts. The story is noble as well as touching, and is told by Dr. Smiles with abundance of sympathy and appreciation."—The Times.

LIFE AND LABOUR; OR, CHARACTERISTICS OF MEN OF INDUSTRY, TALENT, AND GENIUS. 6s.

MEN OF INVENTION AND INDUSTRY. 6s.

"Dr. Smiles has probably done more, by his many interesting books, to uphold the dignity and power of labour than any other writer. He is the prose laureate of industry, and its captains have found in him one who is not only enthusiast himself, but who is also capable of infusing others with a like enthusiasm. . . . We have no doubt that these latest chapters in the history of industry and scientific investigation will be quite as popular as their predecessors."—The Times.

SELF-HELP. | THRIFT. CHARACTER. | DUTY.

SELF-HELP IN FRENCH, 5s. INDUSTRIAL BIOGRAPHY, 6s.

LIFE OF THOMAS EDWARD, Scotch NATURALIST. Illustrated by Sir George Reid, P.R.S.A. 6s.

THE HUGUENOTS: THEIR SETTLEMENTS, CHURCHES, AND INDUSTRIES IN ENGLAND AND IRELAND. Crown 8vo. 7s. 6d.

"The cunning of Dr. Smiles's hand never fails him. He has chosen the prosaic side of Huguenot history, and made it as fascinating as a romance. He has pursued his investigations with a laborious minuteness worthy of the Statistical Society and of the Herald's College; and yet it is as impossible to skip a page as in reading his 'Life of Stephenson.'"—British Quarterly Review.

ROBERT DICK: BAKER OF THURSO, GEOLOGIST AND BOTANIST. With Portrait etched by RAJON, and numerous Illustrations. Crown 8vo. 12s.

"Men of Dick's type are rare; their example is too precious to be lost; but they are themselves the last to recognise their own value. His motto and his watchwords, in the energy of his younger labour, as in his refusal to yield to the pressure of his later troubles, were ever, Work, Devotion, High Endeavour—in a word, that Self-help which is the foundation of all help to others."—Quarterly Review.

JOHN MURRAY, ALBEMARLE STREET, W.

J. LEE wishes to **THANK** the numerous **APPLICANTS** for **SITUATIONS**, which are **NOW FILLED**.

WANTED, a **ROSE PROPAGATOR** and **GROWER** for Cut Blooms, under Glass, for a very large concern, near Antwerp. Advertiser is ready to pay good salary to a first-class man. No other need apply.—Write to A1, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, a **FRUIT** and **HARDY TREE FOREMAN**, for a large Nursery, on the Great Eastern Railway, a well-qualified Man as above. Must have had experience in the Propagation and growing of all kinds of Fruit Trees and Hardy Ornamental Trees and Shrubs, and also be a good Manager of Men.—Apply, J. R. S., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, a **FOREMAN**, married, for Private Establishment. State full particulars of former engagements, with copies of testimonials, to A. L. B. S. Williams and Son, Victoria and Paradise Nurseries, Upper Holloway, N.

WANTED, a **FOREMAN**, under Glass.—Can any Gardener or Market Grower recommend me a strong, healthy, pushing young man, about 25 years of age, single, as above. He must have had a sound training in the cultivation of first-class fruits, particularly Grapes, Strawberries, Peaches, Tomatos, Melons, &c.—W. CONNELLY, Lyme Regis, Dorset.

WANTED, as **WORKING FOREMAN**, a thorough practical and active **MAN**. Must have thorough knowledge of Tomatos, Cucumbers, and Chrysanthemums.—Apply, Huttoo Farm Nursery, Cuckoo Hall Lane, Lower Edmonton.

WANTED, **IMMEDIATELY**, **TWO** thoroughly good **FOREMEN**, about 26 or 27 years of age, to be under Head Gardener. They must be non-smokers and single, and are required for houses only, and must have lived in first-class places and be recommended for ability, activity, and civility. Grapes, Melons, Peaches, and Chrysanthemums, and other hot-house plants; also Carnations and Roses under glass. They would each have the assistance of a boy about 15 to work under them; both on and milk found. Please state wages required, and all particulars by letter only, to Mr. GEO. BOND, Ivy Cottage, Mount Ephraim Lane, Streatham.

WANTED, also, to assist Foremen in houses, **TWO BOYS** of about 15 years old, who have been accustomed to such work either in private houses or at Nurserymen's. Must have good recommendations for cleanliness and intelligence, activity, and civility; room found.—Apply by letter only, to Mr. GEORGE BOND, Ivy Cottage, Mount Ephraim Lane, Streatham.

WANTED, **IMMEDIATELY**, a **MAN**, under the Foreman.—Age about 24; thoroughly experienced in growing for Market, Cut Flowers, Bulbs, Ferns, bunching, packing, &c. Wages, 22s. weekly.—A. X., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, a **Lily of the Valley FORCING MAN**, with a thorough knowledge of the above; also for Cucumbers and Tuberoses.—E. WOOLF, Shirley, Southampton.

ESTIMATING CLERK WANTED; one who thoroughly understands the Construction and Heating by Hot-water of Conservatories and Greenhouses, get out quantities, give estimates from drawings, and submit Plans and Specifications. None but proficient men need apply, and must have occupied a similar position, to W. DUNCAN TUCKER, Horticultural Builder, Tottenham, by letter, stating where last employed and wages required.

WANTED, an **INVOICE CLERK**, accustomed to the Bulb, Seed, and Plant Trade. Hours long. Must be a good quick writer. Salary, 21s. a week.—Apply, by letter only, to BARR AND SON, 12, King Street, Covent Garden, W.C.

H. CANNELL AND SONS are **WANTING**, **AT ONCE**, a respectable young **MAN** as **JUNIOR CLERK**, used to Address Writing. Apply in first instance, in own hand-writing.—Swanley, Kent.

WANTED, **MAN** accustomed to do general **JOBING WORK**, and fill up time in the Nursery. Permanent situation. State wages and experience by letter only.—PENNELL AND SONS, Lincoln.

Seed Trade.

WANTED an **ASSISTANT SHOPMAN**.—Must write well, and be of good address.—Apply, stating salary required to ZEA, Messrs. Hurst & Son, 152, Hound-ditch, London, E.

Seed Trade.

WANTED, an **ASSISTANT**, with a thorough knowledge of the Seed and Nursery Trade in all Departments. Age 25 to 30; to assist at counter, do general work, and travel occasionally. Preference given to one with experience in the Irish Retail Trade.—Apply, stating wages expected, and full particulars, to W. TAIT AND CO., Seedsmen, Dublin.

WANT PLACES.

B. S. WILLIAMS AND SON beg to intimate that they have at present in their Nursery and upon their Register some excellent Men, competent either to fill the situation of **HEAD GARDENER**, **BAILIFF**, **FOREMAN**, or **JOURNEYMAN**. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Victoria and Paradise Nurseries, Upper Holloway, N.

F. SANDER AND CO. can recommend several highly qualified and energetic **HEAD** and **UNDER GARDENERS**, of excellent character, and proved ability; men thoroughly fitted for all the various duties of their profession. For all particulars, please apply to—**F. SANDER AND CO.**, St. Albans.

IMPROVER.—Age 18. **J. THOMAS**, Shardeloes Gardens, Amersham, Bucks, wishes to recommend G. Bellinger as above. Four years' experience. Nearly twelve months in the botchy, taking turns with the fires, &c.

TO GENTLEMEN MARKET-GARDENERS.—Wanted, to place a Youth (age 19), with a Gentleman Market-Gardener as **PUPIL**. State terms.—A., Wimmerleigh Vicarage, Garstang.

TO GARDENERS.—Wanted, by a young man, age 20, a situation (inside preferred) under a good Foreman; four years in present situation. Good character from present employer.—H. STRUTT, Wm. Beer, Florist, &c., Spring Road, Ipswich.

TO GARDENERS, &c.—A young Man (age 21) requires situation, private or otherwise. Six years' experience, with a good knowledge of Glass, Kitchen Garden Work, also Fruit and Flower Culture for Market. Good references.—S. E. Y., Horticultural College, Swanley.

TO GARDENERS, &c.—Situation wanted by a young man, age 23, abstainer and non-smoker. Slight experience. Good character.—W. F., 2, Sherwood Villas, Roxeth, Harrow.

SHOPMAN.—Age 26; twelve years' experience. Good knowledge of Seeds, Plants, and Nursery Stock. Good references.—J. H., Messrs. Bird & Vallance, Downham Market.

SHOPMAN.—Age 32; seventeen years' intimate practical knowledge of the Seed Trade in all its branches. Highly recommended.—LOTHIANS, Alex. Dickson & Sons, Queen's Seedsmen, Belfast.

COWMAN for a Jersey herd.—Thoroughly experienced wife, a good butter maker.—COWMAN, The Lodge, Everleigh, East Barnet.

TO NURSERYMEN.—Situation wanted by a young man, age 21; in a Market Nursery. Five years' experience. Good references.—J. G., Whyfold Villa, Stamford Road, Bexley Heath, Kent.

TO FLORISTS.—ADVERTISER seeks situation in a Fruit, Flower and Plant Business. Used to Retail and Wholesale. Twenty years' experience. Good references. Could supply Horse and Van if required.—Apply in first instance to JOHN BAKER, 538, Oxford Street, London, W.

FLORIST.—Advertiser seeks a re-engagement. Used to Making-up Posies, Wreaths, Sprays, &c.—MISS HARWOOD, Messrs. John Peed & Sons, Norwood Road, West Norwood, S.E.

HOW PEOPLE MAY AVOID GROWING OLD was once explained by a sage who asked how a person could avoid such a misfortune.—"Keep in the wet in winter, and the sun in summer," he said; "never give yourself rest, and fret at everything that happens; and then if you drink plenty of cold water when hot, you may be certain of being able to avoid growing old." The following additional advice makes the problem still easier to solve. Avoid taking Holloway's marvelous Pills when afflicted with a weak constitution, impure blood, bad digestion, or any of the numerous ailments which they can cure or relieve, and the possibility of attaining to a ripe and honourable old age will indeed be very faint.

J. WEEKS AND CO., F.R.H.S., CHELSEA, LONDON, S.W.

TWO GRAND NEW PEAS

OFFERED FOR THE FIRST TIME BY

COOPER, TABER & CO., LMTD.,

90, SOUTHWARK STREET, LONDON, S.E.; AND WITHAM, ESSEX.

TABER'S "DUKE OF YORK."

This is the most distinct and valuable Pea that has been introduced for many years, as it combines earliness with good appearance and fine flavour; is of the most useful height both for market and private gardens, and in robustness of habit, size of pod, and productiveness will satisfy the most exacting. It may best be described as an earlier and dwarfer form of the "Duke of Albany," possessing all the good qualities of that standard variety, but maturing two or three weeks earlier, and producing an equally large crop on a plant growing to a height of only 3½ feet.

We submitted this Pea to the Royal Horticultural Society in 1892, and have much pleasure in stating that it was the only variety to which a *First-class Certificate* was awarded by the Fruit Committee in that year. The following is the Official Report:—"Royal Horticultural Society (Fruit Committee), July 7, 1892, W. WARREN, Esq., in the chair, and nine Members present. Award recommended. First-class Certificate to Pea 'Duke of York' (vote unanimous), from Messrs. COOPER, TABER & Co. An early selection of 'Duke of Albany.'"

COOPER'S "GOLIATH."

In the year 1886, we observed in a row of "Telegraph" Peas, growing in our trial grounds, one plant superior in every way to the others. The seed, when saved, was found to be unusually large and quite distinct. Since that time we have submitted it to repeated trials, and always with the same satisfactory results, added to which it has been uniformly true to character.

The height is about the same as that of the parent variety, but the plant is very much more robust, the pods are larger and more numerous, and the flavour equal to that of the finest wrinkled varieties.

We have therefore much pleasure in offering it, feeling assured that where Peas of fine quality are grown in large quantities for market, no better variety can possibly be found.

Price, in Sealed Pints, 2s. 6d.; Half Pints, 1s. 6d.

TRADE PRICES ON APPLICATION.

THE ABOVE CAN BE OBTAINED FROM NURSERYMEN AND SEEDSMEN THROUGHOUT THE KINGDOM.

W. FROWM and SONS, Snitton Court Nurseries, Chiswick, Branch Nurseries: Hounslow and Acton Green. Established 1829.

SALE OF A LARGE and SPLENDID PRIVATE COLLECTION of ORCHIDS

BY THE

LIVERPOOL HORTICULTURAL COMPANY (JOHN COWAN), LIMITED.

A LIVERPOOL GENTLEMAN has just purchased and placed in the hands of the Company, for Sale on commission, the entire well-known large and splendid Collection of Orchids, formed by E. G. Wrigley, Esq., of Victoria House, Dukinfield, near Manchester.

Mr. Wrigley's Collection is well known as one of the finest in this part of the country. The collection of DENDROBIUMS is certainly surpassed by few, if any, either in point of cultivation or variety. All the plants are in splendid health, and many of the finest varieties in cultivation are included, as well as some of the finest unflowered hybrids yet obtained.

The CATTLEYAS and L. ELIAS are also a grand lot, including many splendid specimens, and many rare and fine varieties. The CATTLEYA MOSSIE are a specially large and splendid lot; there are hundreds of fine specimens of this Cattleya alone, and all are clean, healthy, and vigorous.

The CYPRIPEDIUMS are a large and fine lot also, in splendid health, and include many of the finest hybrids, named and unnamed.

The ODONTOGLOSSUMS are also a fine lot, as are the ONCIDIUMS, CYMBIDIUMS, CELOGYNES, &c. In fact, the collection includes all the species and varieties usually found in first-rate collections.

Mr. Wrigley has given a great amount of personal attention to his Orchids, and has taken special care of the names and descriptions, which may with confidence be relied upon, and, in addition, they will be guaranteed by the gentleman for whom the Company is selling.

All the plants are models of good culture and cleanliness. Mr. Wrigley stated when the purchase was made, that not a single insect pest of any kind could be found on any Orchid in his Collection, and there is every reason to believe that his statement is correct.

THE COLLECTION IS NOW ON SALE, and Inspection is very earnestly invited.

Priced and Descriptive CATALOGUES are now ready, and will be sent, post-free, on application to the Company.

THE VINEYARD & NURSERIES, GARSTON, NEAR LIVERPOOL.

SEVENTH ANNUAL CLEARANCE SALE.

Office: 755, OLD KENT ROAD, LONDON, S.E.

Works (the Largest Steam Horticultural Works in the World): 747 to 755, OLD KENT ROAD, LONDON, S.E.

Show Ground: DEVONSHIRE GROVE (adjoining).

Being the end of the Season, I am again induced to offer my Stock on hand at ridiculously Low Prices, to make room for my **SPRING STOCK**, for **SIX WEEKS ONLY, COMMENCING DEC. 4. LAST DAY of SALE, SATURDAY, JAN. 13, 1894.**

CONDITIONS OF SALE.

Goods are offered subject to being on hand on receipt of reply. Cash to accompany all orders, and prices to be strictly *net*. All orders will be executed in rotation, and carefully packed and put on rail, except those otherwise stated.

P.O.O. payable at 794, Old Kent Road; Cheques crossed "L. and S. W. Bank."

GREENHOUSE DEPARTMENT.

THE AMATEUR FORCING HOUSE. TENANT'S FIXTURE (Span-roof).

These houses are offered at an exceedingly low rate, and should be readily approved by both amateur and professional gardeners, as brick work, which is very expensive to a small house, is entirely dispensed with.

The utility of such a house for forcing or cultivating Cucumbers, Tomatos, Melons, &c., will be perceived at a glance, it being a structure constantly in request but almost hitherto unknown.

Specification.—Framework substantially constructed of red deal; the whole of sides, and 2 ft. 6 in. of ends, boarded with well-seasoned tongued and grooved matchboards. Half-glass door, complete with rim lock and brass fittings, in one end; glass 16 oz. throughout, English cut. Ventilators supplied according to size of house, and stays necessary for opening same; stages for plants each side of house, all woodwork painted one coat of good oil paint, and the whole structure securely packed and placed on rail.

SPAN-ROOF FORCING HOUSE.

The illustration shown will convince all practical minds of the importance and utility of this class of house for Gentlemen, Nurserymen, Market Gardeners, and all those who require a cheap strong House for Forcing, or growing Cucumbers, Tomatos, Melons, &c.

Specification.—Built for brickwork, 3 feet high, of thoroughly well-seasoned red deal; roof ventilation according to size; door at one end; all 21-oz. glass; painted one coat.

SPAN-ROOF VILLA CONSERVATORIES.

Adaptable for the lawn of a villa residence, being well and substantially-built, constructed of the best materials, and artistically finished, with diagonal panels and barge-boards. The framework is composed of 2 in. by 3 1/2 in. red deal, the lower part doubly-lined with tongued and grooved matchboards, and the roof properly fitted with sashes, which facilitates fixing or removing of same without disturbing glass.

The houses are fitted with a half-glass door, complete with rim lock, brass fittings and key, and is supplied with lattice staging for each side, footpath the entire length; gutters, down pipes, suitable ventilators, and necessary ironwork for opening same. All woodwork painted two coats of good oil paint, glass cut to sizes, and all parts securely packed on rail. Prices:—

THOMAS GREEN & SON, LTD.,

LEEDS and LONDON,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered

HOT-WATER BOILERS,

Others with TUBES, SHELVES, & HOLLOW or ORDINARY CAST-IRON GRATE BARS.

SADDLE BOILERS, With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant. The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the FIRST and HIGHEST PRIZE—a SILVER MEDAL—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

MUNICIPAL PATTERN BOILER, THE BEST EXTANT.

The longitudinal section gives a view of the fire-box, water space, flues, &c. The cross section gives a view of the fire-box water space and V-shaped back. The front elevation shows it set in brickwork, which is necessary for this class of boiler.

THE IMPROVED GARDEN GULLY (VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are:—

8-in., 2s.; 10-in., 3s.; 12-in., 6s. 6d.

(The larger sizes are very strong for carriage drives.) Full Particulars and Testimonials on application.

ANTHONY WATERER

Invites an inspection from intending Planters to the following well-grown TREES, having stout, clean stems, with handsomely-furnished, well-balanced heads, and from frequently transplanting are splendidly rooted; the girth of the stem is taken at 4 feet from the ground:—

- ACER DASYCARPUM, 14 to 20 feet, girth 4 to 8 inches.
 - " WIERI LACINIATUM, 10 to 14 feet, girth 3 to 5 inch.
 - " NEGUNDO VARIEGATA, Standards, 8 to 10 feet.
 - " REITENBACHI, 12 to 14 feet, girth 4 to 5 inches.
 - " SCHWEDLERI, 12 to 18 feet, girth 4 to 5 inches.
 - " WORLEVI, 12 to 14 feet, girth 3 to 6 inches.
 - BEECH, Purple, Pyramids, and Standards, 10 to 20 feet, girth 4 to 9 inches.
 - BIRCH, Silver, 12 to 14 feet, girth 3 to 5 inches.
 - CERASUS SEROTINA (American Bird Cherry), 12 to 16 feet, girth 6 to 7 inches.
 - CHESTNUTS, Horse, 14 to 20 feet, girth 6 to 11 inches.
 - " Double White, 14 to 16 feet, girth 6 to 8 inches.
 - " Scarlet, 12 to 18 feet, girth 4 to 10 inches.
 - " Briots, 10 to 14 feet.
 - ELMS, English, 10 to 12 feet, girth 3 to 6 inches.
 - " Guernsey, 16 to 18 feet, girth 7 to 9 inches.
 - LIMES, 12, 16, and 20 feet, girth 3 to 10 inches.
 - " EUCHLORA or DASYSTYLA, 12 to 14 feet, girth 4 to 6 inches.
 - " Silver-leaved (Tilia argentea), 12 to 14 feet, girth 5 to 6 inches.
 - LIQUIDAMBAR, 6 to 10 feet.
 - MAPLE, Norway, 12 to 16 feet.
 - OAK, English, 12 to 14 feet, girth 4 to 5 inches.
 - " Scarlet American, 12 to 14 feet, girth 4 to 5 inches.
 - POPLAR CANADENSIS NOVA (the true variety), 12 to 16 feet, girth 6 to 7 inches.
 - SYCAMORE, Common, 12 to 17 feet, girth 4 to 7 inches.
 - " Purple, 14 to 16 feet, girth 6 to 7 inches.
 - THORNS, Double Pink, 8 to 10 feet.
 - " Paul's Scarlet, 8 to 10 feet.
 - " Double White, 8 to 10 feet.
- WEeping TREES.**
- BEECH, Weeping, Pyramids, and Standards, 8 to 12 feet.
 - " Weeping, Purple, Pyramids and Standards, 7 to 12 feet.
 - BIRCH, Young's Weeping, Pyramids and Standards, 8 to 14 feet.
 - " Cut-leaved Weeping, Pyramids and Standards, 10 to 12 feet.
 - ELMS, Weeping, Pyramids and Standards, 7 to 14 feet.
 - LARCH, Weeping, Pyramids, 8 to 10 feet.
- KNAP HILL NURSERY, WOKING, SURREY.**

S. SPOONER & SONS,
HOUSLOW NURSERIES, MIDDLESEX.

NEW CHRYSANTHEMUMS.

We have great pleasure in announcing that we have acquired from Mr. T. H. Spaulding, New Jersey, U.S.A., the sole right of distributing his new set for 1894 in Europe. The plants arrived too late to produce exhibition blooms this season, and we were therefore unable to show them for Certificate, but the flowers we have had are wonderfully promising and fully bear out the raiser's descriptions. Mr. Spaulding tells us that this is the finest set he has ever sent out, which, coupled with his position as the first raiser in the States, will be ample proof of the value of these novelties. We have a good stock in hand, and shall therefore be able to supply strong healthy plants struck root, which will bear full-sized blooms the first season. Catalogue containing these and the cream of all the other novelties, ready in a few days, free on application.

OFFER to Purchasers the **FINEST STOCK** of
DEVELOPED
FRUIT TREES
IN BRITAIN.

Their larger-sized Trees save years, and bear Fruit at once.

"Kent—I may tell you I have bought fruit trees from five other noted growers, and yours were far the best examples."

Special attention is called to the specimen Espalier Apples, Amateur's Standard Apples, Cordon, Gridiron, Double Cordon, and very large Pyramidal Apples on Paradise Stocks, all of which will fruit in the first year of planting.

Large Pyramidal Plums, Peaches, and Nectarines, trained on stems 2 feet to 6 feet. Perfectly ripened and bristling with fruit buds.

"Middlesex.—Am delighted with the fruit trees—a splendid lot—so clean and robust, with fine roots."

Extra fine Peaches and Nectarines in Pots, 5s. to 10s. 6d.

Trained Peaches and Nectarines in Pots, to fruit at once, 5s. to 7s. 6d.

And every kind and style of Fruit Trees.

Short-jointed and well-ripened Vines, &c.

"Scotland—Apple trees received last week in splendid condition."

"Hants.—The specimen Pears came to hand scarcely a twig broken."

"Cheshire.—Have found your trees more correctly named than any I have purchased elsewhere."

A grand lot of Scotch Fir, 4 feet to 6 feet, stout and well-rooted; Larch, 2 feet to 6 feet.

Specimen Austrian Pines, 4 feet to 8 feet.

Christmas Trees (Spruce) up to 20 feet.

"Kircubright—I have had splendid fruit from the trees you sent me last year."

"Suffolk.—The 3000 fruit trees sent are a grand lot."

125 ACRES Well-grown NURSERY STOCK.

THE
Gardeners' Chronicle.

SATURDAY, DECEMBER 9, 1893.

THE ROSE-GARDEN IN AUTUMN.

I DO not mean by this to imply the early autumn; and, indeed, there is a good deal of difficulty in determining when our seasons begin and end; but I mean rather to refer to the work that is to be done in the Rose-garden about November and the early part of December. I am sorry to say that this year I am compelled to be like the finger-post pointing the way, but not going along it, for the illness of my gardener has completely thrown me back, and several of the directions I give for the benefit of others, I have as yet been unable to follow out myself.

The eccentricities of the past Rose season were not confined to the summer, but have been continued on throughout the growing season. When I looked round upon my small rosary about the middle of July, I thought the outlook very poor; I saw no signs of those long shoots coming from the base of the stems, on which we are wont to rely for our next year's bloom; but after the rains of that month a marvellous change took place: the buds began to push forth, and grew on so rapidly, that shoots of 7, 8, and 9 feet, are not unusual—in fact, I have never seen such vigour in any preceding year. Why this should be so, with the soil in the condition in which it was, I do not know, but probably it may be somewhat like what the late Dr. Henry Bennet said in the *Rosarians' Year-book* concerning the Riviera Roses, that the long, dry summers gave a period of rest to the plants, and that when the autumnal rains set in, they started off with marvellous rapidity, and developed a wealth of beauty during the dead part of the year. We have not the climate of Mentone, and therefore the efforts of our poor Roses are confined to their making a good supply of wood. Although we have had two or three sharp touches of frost, there has been nothing, nor is there anything, to interfere with the operations now necessary.

First of all, with regard to planting: there are two classes of persons who are interested in this, those who are about to make a Rose-garden, and those who merely wish to replenish their beds where losses have been experienced during the summer.

I can quite endorse the views lately put forward by a contributor as to the mistakes which are made in selecting a place wherein to grow Roses; but I believe that, in the majority of cases, the error is made of providing too much shelter rather than too little. As to great places, I have invariably found that the larger they are the worse care does the Rose obtain; sometimes, indeed, the influence of "my Lady" is brought to bear when "his Lordship" has

dismissed the subject with a sneer. I remember some years ago, for instance, going to one of the grandest places of historic interest in the Midlands, when, as I usually find, the gardener and I became very good friends. "I am ashamed," he said, "to show you my rosary; but what can I do? the Countess would have it so, and I can only obey orders." I went to see it, and a melancholy sight it was. Planted in really unnotuous soil, the plants had grown abnormally strong, but as the place was surrounded by a belt of high Elms at no very great distance, the plants had been drawn up, the shoots were long and weak, and covered with mildew, whilst the flowers were poor and hardly recognisable. Had I my choice between an over-exposed situation and an over-sheltered one, I should certainly prefer the former. Where it is necessary to form a new plantation, be it large or small, with a couple of thousand or two hundred, the same rule holds good—they must have a place to themselves. Of course, a few may be planted in the borders, if necessary, but no one who would desire to enjoy them thoroughly will grudge them the place to themselves. The best plan is to place them in beds 4 feet wide, the length to be determined by the number of plants to be used. I believe the conviction is gradually forcing its way amongst amateurs, that the Briar stock seedling or cutting is preferable to the Manetti; this is evident from the large number of these stocks now planted by nurserymen in comparison with former years. In planting, the width between the plants will be regulated by the exigencies of the grower; 3 feet is a very good allowance, but where space is of importance they may be put closer together.

I do not think it is at all desirable ever to place manure in the beds unless they are trenched, and the manure laid at the bottom. All plants, when freshly put in, should have short stakes placed there in order to prevent them from being blown about in high winds; and they should be firmly planted, the roots being carefully spread about. After the planting of the beds has been completed, they should be mulched over, and so left during the winter.

Where the only work of planting is that of supplying gaps, which have been made from one cause or another, the same rules must be observed, that is, no manure put into the holes, firm planting, and securing of the plants. When this is completed, the earth may be drawn up to the collars of all the plants, in the same way in which Potatoes are earthed up, and the beds covered over with farm-yard manure, that is, where it is possible; but in our part of the country, East Kent, there is hardly any straw, and many of us have been obliged to litter our horses with the German moss litter, which however excellent for that purpose, does not afford the same amount of material for after use.

With regard to pruning, I have of late years advocated the practice of cutting out in the autumn all the blooming wood of the past season, leaving only those long shoots from whence we expect our crop of the next year. These shoots are, as I have said, in many instances, so strong that the question is, whether they shall be cut back hard in the spring, or left longer. It is said, if the former course be adopted, we shall have a quantity of wood next year, but not so much bloom. I am myself inclined to adopt another method, namely, that of pegging down. Many years ago I recollect seeing in the gardens of the late Mr. Charles James Perry, of West Bromwich, Birmingham, a bed of Roses so treated, and nothing could have been more beautiful than the effect. From

nearly every axil bloom-buds started, and the whole length of the shoot was covered with flowers. I do not know whether the flowers on shoots so treated would stand the test of exhibitions, probably not, as the shoot would have too many flowers to support for that purpose; but I do know that the effect for garden decoration was very fine. The shoots were bent down, and secured to short stakes; or, a short hooked stake was used, and the shoot was pegged down much in the same way as Verbenas. In the foregoing directions I have had in my mind simply the hybrid perpetuals. Teas must be treated differently, they are even now at the end of November growing and flowering, and these shoots must of necessity succumb to the first severe frost; in the meantime care must be taken to protect the lower parts of the shoots by earthing them up as already directed for H.P.'s, and then spreading some covering over the bed in the way of mulching, or litter of any kind that may be at hand for the purpose. I do not think on the whole that the Teas are much more delicate than the hybrids; there are some varieties which are of weakly constitution, as there are some hybrids which are so also, but on the other hand such varieties as Marie Van Houtte, Madame Bravy, Madame Lambert, and Comtesse Riza du Parc bear quite as much hard weather as any hybrids. With regard to garden Roses, I have not much to say, the longer growing kinds will require fresh staking, or where planted against walls or fences, fresh nailing and securing; they do not require any protection, and are tolerably well able to take care of themselves. There are two good climbing Roses in this section which ought to be added to any collection, Bardou Job and Turner's Crimson Rambler—both bright in colour, the former nearly single and the latter a good semi-double. *Wild Rose*.

ORCHID NOTES AND GLEANINGS.

ZYGOPETALUM GRANDIFLORUM, *Hemsley*.

A MEXICAN and Granadan species, also known as *Galeandra grandiflora* and *Batemanina grandiflora*. The flowers are produced on a basal scape, each flower being about 3 inches in diameter. The sepals and petals are light green, with five to seven longitudinal red-brown lines. The lip is sharply denticulate at the margins, white with reddish-purple raised lines, which are also denticulate. The crest is semi-circular, orange-yellow with numerous red-brown radiating ridges, each of which terminates in a spine-like tooth in front. Habitat and culture as for *Stanhopea Lindenia*, t. 393.

LYCASTE CINNABARINA.

A handsome species, originally discovered by Warszewicz in Peru, and now introduced into cultivation by MM. Linden. The oblong sepals and petals are white, the lip light orange-brown, elliptic oblong, obscurely three-lobed, narrowed at the base, 4-cm. long, the lateral lobes small, rounded, obtuse, the central lobe orbicular-oblong obtuse or emarginate, nodulate, toothed, with a large fleshy callus. *Lindenia*, t. 394.

CATTLEYA VELUTINA.

Flowers 3½ inches in diameter. Sepals and petals spreading, oblong obtuse, orange-brown with purple spots, lateral lobes of lip convolute, anterior lobe suborbicular, white with radiating purple veins. Native of South Brazil, *Lindenia*, t. 395.

VANDA TRICOLOR VAR. HOVELL.

Segments white, red-spotted, lip deep rosy-lilac. *Lindenia*, t. 396.

BARKERIAS FROM HIGBURY.

Three weeks ago the Right Hon. Joseph Chamberlain, M.P., forwarded some splendid spikes of

varieties of *Barkeria Lindleyana* and *B. elegans*, which gave excellent proof of the successful culture of these plants in his collection. The object of the present note is to point out the extraordinarily long time these elegant rosy-crimson Orchids last if kept in a cool room without gas. The spikes were borne on the plants for a considerable time before being cut, and were fully expanded when we received them; and after three weeks in water under the conditions stated, the flowers are as fresh as when received. The genus *Epidendrum* has many species which last a long time in bloom, but the *Barkeria* section seems of the longest duration.

DENDROBIUM SUPERBIENS.

This is not as yet a common species, and its beauty would warrant an importation of it being made. A fine inflorescence with a dozen rose-purple flowers is sent by Mr. James Crispin, Nelson Street, Bristol, who grows it with *D. Phalenopsis*, *D. bigibbum*, &c. Flowers of *Cypripedium* × *vexillarium*, *C. × Arthurianum*, and others come with the *Dendrobium*, the two hybrids of *C. Fairrieanum* named fully warranting the remark of the sender "What lovely things these are!"

CYPRIPEDIUM × LEEANUM VARIETIES.

Messrs. Heath & Son, nurserymen, Cheltenham, who are famed for the fine varieties of this plant, and especially for their noble *C. × Leeanum giganteum*, send a box of flowers showing the great variety of beautiful forms given by their seedlings of *C. Spicerianum* crossed with the best forms of *C. insignis*. Some have the upper sepal nearly all white, and with scarcely any purple spotting; others have very large dorsal sepals, with purple markings, spread almost entirely over the surface except the margin, and there are all grades between these two extremes. The flowers are all of fine size and substance.

CATTLEYA WALKERIANA VAR. NOBILIOR.

Notwithstanding the fact that the "nobilior" variety of *C. Walkeriana* (bulbosa), originally illustrated in the *Gardeners' Chronicle*, June 9th, 1893, and of more recent introduction (fig. 108, p. 713), than the type, is of stronger growth than the earlier importations; in but few gardens has it been induced to thrive for any length of time. It is usually grown in baskets or on blocks, but Mr. E. Hill, gardener to Lord Rothschild, at Tring Park, has had the best success with it for years, by growing it in pots, and standing these on a ledge of the brickwork at the end of the house in which *Vanda terea* is grown, and close to the glass end of the house, where the plants have plenty of light. Every year the plants increase in size, and the pseudobulbs young and old are stout and plump. For some time they have been giving a succession of their large dark rose, fragrant flowers, and will yet continue a long time. *L. crispilabia* also thrives in the same way.

BULBOPHYLLUM VIRTUM.

This singular and exquisitely-fragrant species is flowering in the Orchid-house at Tring Park, and is noteworthy on account of its elegant nodding racemes of small white flowers, having on each spike one or two odd flowers different in colour (yellow), and somewhat in structure low down on the ascending or basal portion of the inflorescence. On a small scale the arrangement is of the nature of the odd flowers in the *Arachnanthe* (*Vanda*) *Lowii*, and probably serves some useful end in the economy of the plant by furthering fertilisation by insect aid.

LELIA ANCEPS VARIETIES.

These are now very beautiful in Lord Rothschild's collection at Tring, and are being used to form some beautiful table decorations. All the known varieties are to be found in the house devoted to them at Tring Park, and among the specimens, the champion plant of the true white *L. anceps Williamsii*. A spike of the fine *L. a. Schroderae* of the *L. a. Amesiana* class, has charmingly crimson-tipped petals and fine purple-crimson lip.

ARACHNANTHE CLARKEI.

A native of the Sikkim Himalaya, where it grows on a thickly-wooded creast or ridge, at about 6000 feet elevation. It was discovered by Mr. C. B. Clarke, F.R.S., the indefatigable Indian botanist whose name it bears. It was introduced by Messrs. Hugh Low & Co., of Clapton, in 1885 or 1886, and flowered for the first time in this country in the autumn of the latter year in the collection of the late Mr. John Day at Tottenham. It also is a native of Bhotan. It is allied to *A. Cathcarti* of Bentham, the old *Vanda Cathcarti* of Lindley, on which the genus *Esmeralda* was founded by Reichenbach, which, however, being identical with the older genus *Arachnanthe* of Blume, should not be recognised. It is readily distinguished from *Vanda* by its articulated lip, which is common to all the species, but in the present one is so delicately attached that the slightest touch imparts to it an oscillatory motion. It is much more easily cultivated than *A. Cathcarti*, and requires cooler treatment and

PHALÆNOPSIS SANDERIANA.

A native of the Philippine Islands, introduced by Robelin to the establishment of Messrs. Sander in 1882. It flowered for the first time in 1883 in the collection of Lord Rothschild, and is by some considered as likely to be a natural hybrid between *P. Aphrodite* and *P. Schilleriana*. It is supposed to be the source of the traveller's tale concerning a scarlet *Phalænopsis*, the flowers being really of a rosy-lilac. *Reichenbachia*, t. 68 (1).

ABBERLEY HALL GARDENS.

DURING a recent journey through the Teme Valley, I found myself at Abberley Hall, the fine Worcestershire seat of W. Jones, Esq., situate on an eminence overlooking some very fine scenery, and enjoying extensive views. I knew the gardens of Abberley Hall by repute, and knew Mr. Young as an advanced and trustworthy gardener. I was not disappointed

The collection of *Chrysanthemums* in flower at the time had a very fine effect, consisting as it did of about 600 plants, 350 being grown for large flowers to adorn the conservatory, and the remainder as bushes to supply cut flowers. The newest and best varieties are grown.

The Peach wall, which is 100 yards long, is a model of its kind. Every tree is perfect, and they never fail to yield large crops. The difficulty is, that the fruit sets so thickly that a great deal of time is consumed in thinning it. The following varieties are grown: Dymond, Stirling Castle, Walburton Admirable, Dr. Hogg, Crimson Galande, Noblesse, Sea Eagle, and Barrington.

I may here remark that every part of these fine gardens was in perfect order, and the crops in the kitchen garden, the inmates of the stove and greenhouse, and the beds and borders of hardy flowers all told of good cultivation. *Quintin Read*.

CHRYSANTHEMUMS ABOUT LONDON.

(Continued from p. 619.)

MESSRS. H. CANNELL & SONS.—A visit to the Swanley Nurseries at this season is especially cheering, inasmuch as the floral treats to be seen there are so little in character with the not too kindly elements outside. The winter-blooming zonal *Pelargonium*, for instance, filling three or four of the long, low, span-roofed houses, are unquestionably tonic in their effect upon the mind, after battling with the fierce wind, and perhaps damp, misty atmosphere on the way there. One feels little inclined to differ from Mr. Cannell when in his quite pardonable pride he speaks in such flattering terms of his gay favourites, and declares that no other plant can create so bright a show as they present in the dullest, most unfavourable portion of the year. There are hundreds of gardeners in parts distant from London to whom such a sight would be a revelation; for, after all, the places are not numerous where the culture of these well-known plants is a success, when grown for winter-blooming. But these were not the objects of our visit at this time, and it was only on our way to the *Chrysanthemum*-house that Mr. Cannell led us through those of which we now speak. In passing, therefore, we must only remark that *Raspail Improved* is the best double scarlet ever seen, and its blooms, produced in greatest freedom, are large, very double, and wonderfully bright. The single varieties continue to show improvement in colour and in size.

The house devoted to the *Chrysanthemums* is a large one, long, and wide, and there were about 3500 plants arranged there, giving a grand show, and comprising a great number of novelties and seedlings. In noticing a few of these, and others of earlier date, we can only mention a few of those that were in good form at the time of our visit. Robert Owen, an incurved Japanese, of bright golden bronze, is a compact pretty flower, well worth growing by all. The Duke of York was represented by three good blooms on a plant; the flower is very large, and the florets are rosy-magenta, with reverse side of deep pink, shaded with silver. This, and Robert Flowerday, appear to be much alike in form and in colour. The new Golden Gate was good; it has very broad florets, buff, or bronzy-buff, in colour, and it will make a large flower another season. Mrs. Wm. F. Dreer is another Japanese, flower rather smooth-looking, of bronze and yellow, and showing invariably a good centre; it came from America last season. Ernest Westland is a large, heavy-looking Japanese, with rather short and somewhat narrow florets, but very deep, in colour a mixture of dull red and yellow—a seedling from France last season. An experiment had been made with Col. W. Smith, by grafting it upon another variety, and the result indicates that treated so, the florets are not given to damping; as this variety is a sinner in this way sometimes, a larger batch will be treated thus next season. Comtesse de Galbert is a pale flesh-coloured incurved Japanese, and will make a good flower; the colour is especially pleasing. A very deep reflexed Japanese is Ville de Nimes; the florets are rather short and narrow, in colour pink,

FIG. 108.—CATTLEYA WALKERIANA VAR. NOBILIOR. (SEE P. 712.)

more light. Its handsome orange, buff, and brown flowers are produced in the autumn, and lasts about six weeks. *Reichenbachia*, t. 65, from a plant in the Royal Gardens, Kew.

ZYGOPETALUM BERTII.

A native of Costa Rica, where it was discovered by Eudrea in 1867, and imported by Messrs. Veitch. It requires to be placed in the warmer end of the *Cattleya*-house in a very shady position. It should be grown in good fibrous peat, with plenty of drainage and abundance of water when growing, but none must be allowed to stagnate about the roots. The plant is well figured in *Reichenbachia*, t. 66.

CATTLEYA PARTHENIA X.

This handsome hybrid was raised from *C. fimbriata* fertilised with the pollen of *C. Mossiae*, *C. fimbriata* itself being also a hybrid between *C. Aclandiae* and *C. intermedia*. The sepals and petals are pure white, the lip is entire, with a wavy margin. The convolute side lobes white, the disc light yellow, and the front lobe delicately pencilled with light rose. It was raised by Mr. Alfred Blen of Paris in 1878, but did not flower until 1889. It requires the same treatment as *C. Mossiae*. *Reichenbachia*, t. 67.

in finding evidence of this in the excellent Grapes and *Chrysanthemums* and the renowned Peach trees. Mr. Young is not an exhibitor, and therefore the outer world has but little opportunity of seeing his productions. Turning into one of the vineries, planted with Mrs. Pince's Muscat, Black Alicante, and Lady Downe's Seedling, well-finished bunches of Mrs. Pince were noted, some of which weighed from five to seven pounds. It is well known that this Grape requires much skill to grow it to perfection. The bunches of Black Alicante were quite as good as those of Mrs. Pince, massive, tapering, and furnished with a great breadth of shoulder, the bloom and finish being perfect. It is no uncommon thing to have the bunches five or six pounds each, and Mr. Young has no difficulty in securing such year after year. The Lady Downe's Seedling, though good, were not so large as the others, owing, I was told, to a root having got into the subsoil of the border, but now that the runaway root has been found and cut close back, the Vine has improved. The Muscat Grapes, in another vinery, were quite as good as the above, the bunches large and the berries plump, and of that amber tint which is characteristic of the Muscat of Alexandria when in its best state.

with a shade of cream at centre. Leviathan is expected to make a capital Japanese, flowers large, rosy-crimson, with silver reverse. Madame Chas. Molin is a white flower, of the habit and form of Vivian Morel, and will be well worth growing as a white one of that form. Amy Chantler is a very pretty flower, the centre florets are marked with a tinge of amaranth, but the rest of the flower is pure white—quite a charming variety. David Rose is an American seedling, flowers heavy-looking, deep, and large; florets wide, and of a dark rose colour. Golden Wedding, Etoile de Lyon, Vice-President Calvat, Sorteaux of 1893, and Mille, Thérèse Rey were noticeable for good flowers, as were A. H. Neve, Vivian Morel, Lord Brooke, and Souvenir de Madame G. Eynard, the latter a fine decorative variety, of bronzy-crimson and yellow. Mr. Jas. Carter is a small flower, introduced by Messrs. Carter & Co. from Japan, which may be described as a neat little bloom for button-holes and such work; the florets are straw-coloured, short, extremely narrow, and a little quilled. Piper Heidsieck is a seedling of the same kind, but the flower is a little larger, and almost white.

The work of propagating the varieties is done in a systematic and excellent manner. In several of the houses there are thousands of small plants that have been lifted from the open ground, and as they have never been in pots, and have never had any strong manures, they are certain to throw healthy and clean suckers. When brought into the houses, they are cut down, placed thickly together in rows, and covered with ordinary soil.

Besides the attractions at Swanley already noticed, we may mention the house used for the display of winter-blooming Begonias, which is already beginning to look enticing, but which may be seen at its best about February next; and another house containing a quantity of Bouvardias.

Cyclamens, Primulas, and such plants, are looking well. *Visitor, Nov. 18.*

FORESTRY.

THE USE AND ABUSE OF THINNING.

THERE are probably few foresters of the present day who still thin their woods by the well-known rule of leaving a distance between each tree equal to one-third of the average height. However efficacious the adoption of such a principle would be in assisting to produce a healthy plantation, no one with any pretensions to a knowledge of silviculture would hope to produce clean timber thereby. Advanced silviculture follows closely in Nature's footsteps, not altogether because her results are better than those obtained by the art of man, but rather on account of necessity compelling us to leave the greater part of the work of timber production in Nature's hands. The forester can plant or sow his crops just as the farmer or gardener can, but he cannot afford to hoe, manure, and prune his trees with the same care and labour that we see expended on cultivated vegetables, cereals, and fruit trees. This fact constitutes the fundamental distinction between arboriculture and silviculture. With the former any operations are permissible which stimulate the growth and improve the shape of a tree, but with the latter the skill of the forester lies less in what he is able to accomplish, than in the amount of labour he is able to dispense with.

Artificial thinning is quite an unnecessary operation in the early stages of a pure plantation's growth, for the simple reason that Nature invariably commences the work of crushing out weak individuals as soon as close order is obtained, and carries it on incessantly until height-growth culminates. By such means are the trees early deprived of side-branches, while sufficient space is ensured for the growth of the stronger or dominant trees. With mixed plantations, specific rates of growth, capacity for bearing, shade and adaptation to soil, climate and situation, determine what species shall dominate, and what be suppressed, although the latter term may only apply to the height, and not to the health and vigour of the smaller trees. The necessity for thinning here depends entirely upon the species it is desirable to retain. Where the dominant trees are light-demanders, and the suppressed shade-bearers, normal

growth may continue for a long period without artificial aid, and a mixture formed on this principle will enable a heavy crop of timber to be grown on a given area. But where this order is reversed, we must either allow the light-demander to be crowded

growing in peaty sand overlying loam and marl. The plantation in which they were growing was thinned twelve years before the trees were cut, and the following table gives the results of analyses of the respective sections:—

Height in Metres.	Average Breadth of Annual Ring in the Periods.			Average Annual Increase in Sectional Area in the Periods.			Proportion of Increase of Sectional Area of two last Periods to the First.			Specific Dry Weight of Periodic Growth.			Percentage of Shrinkage in Periodic Growth.

STEM II.

out, or give it space by thinning. Scientific silviculture only mixes species on the former system, for by the latter, rough timber (from non-suppression of side-branches) invariably results, unless pruning can be profitably performed; and even this operation will not always produce a straight stem.

Thinning, then, if properly carried out, assists Nature in her work, by simply removing those trees which are no longer taking part in the struggle for supremacy; or at the most, by throwing weight into the scales where the issue is doubtful, or likely to be too protracted.

So far our remarks only apply to the early half of a plantation's growth. After middle age, the formation of fresh side branches is improbable, and a healthy and properly-cleaned stem seldom throws out water-shoots. The physique, as it were, of the trees is established, and growth in an economic sense is chiefly confined to the thickening of the stems. In many cases natural thinning has provided ample space for the crowns to perform their assimilative functions, and other things being equal, a progressive increase in stem-volume is almost certain to occur in the dominant trees; but where the latter are not so far ahead of their smaller neighbours as to be entirely beyond their influence as regards light and space, artificial thinning may produce beneficial results by giving them a better supply of light for the service of their crowns. By carrying out this work in a judicious manner, the forester may enhance the value of a crop of timber, which is nearing maturity, considerably, not only by increasing the volume of the annual increments, but also by raising the quality of the wood. Some investigations carried out by Dr. Schwappach on two Scots Firs, and particulars of which were published in the *Forst und Jagdwesen* for October, 1892, clearly demonstrate this. The two trees of which stem analyses were made were 147 years of age, and

We thus see that coniferous wood does not necessarily increase in quality inversely to the breadth of the annual ring (although in many cases it is found to do so), for the specific weight of the wood formed during the last period is greater than any formed previously. It frequently happens also that after the hundredth year or so, the growth of Scots Fir diminishes in a thick wood, but in this instance the reverse has been the case after thinning had admitted additional light and air to the crowns. From a practical point of view, the increase in ring-breadth is of far more importance than that in quality. In the conversion of the timber most, if not all, of the last few years' growth of a stem is lost or put to unimportant uses, but the increased ring-breadth adds greatly to the total volume of the tree, and consequently to its market value.

The results which are likely to follow thinning thus depend greatly upon the stage of the plantation's growth at which it is performed. During the early stages, thinning (as the term is generally understood in this country) is usually more injurious than beneficial, owing to its favouring the growth of side branches, and producing rough timber; but after height-growth culminates, a certain degree of open order is a great advantage. If this latter state of matters has not already been secured by the survival of the fittest only, artificial thinning may be requisitioned in order to bring it about. The exact time at which the forester should step in to perform this work will vary with species, soil, and situation, but it should be done before any serious diminution in the breadth of the annual rings occurs. This can be easily ascertained by the investigation of two or three selected stems, and although thinning may not in all cases have the desired effect, it will be found to produce it in many cases, providing other disturbing causes have not supervened. *A. C. Forbes, Bowrad, Calne.*

CONTINENTAL NOVELTIES.

COCKSCOMB VESUVIUS (FIG. 111, p. 723).

This novelty has a comb of a fiery-red, on a ground of golden-yellow. The plant is of dwarf habit, and the comb is well elevated above the green foliage. The comb is less dense than those of other varieties, and the golden ground, and the red upper part, is well presented. The contrast is perfected by a line of fiery-gold running over the whole length of the head. The variety is well adapted for the market, as well as for the private garden.

DWARF FRENCH MARGOLD, PURPLE AND GOLD.

The dwarf Marigold (fig. 109) is described as a symmetrical grower about 12 inches high, and flowers continuously from July until frost occurs. The blooms are single, about $1\frac{3}{4}$ inch across, of golden-yellow, with a purple-velvety spot on each of the six or eight florets. The flower is fragrant, and is especially good material for cutting purposes, bouquets, &c.

SUNFLOWER, LOREN'S MILLOWERED (FIG. 110).

This is a robust variety, growing to a height of 12 to 15 feet, when planted singly in good soil, and is branched from base to top, each branch bearing a number of medium-sized golden-yellow flowers, with small black centre. It is recommended for planting singly on lawns, and for covering naked parts in the garden.

For the opportunity of illustrating the above novelties we are indebted to Mr. C. Loreuz, Erlurt, Germany.

A TRAVELLER'S NOTES.

(Continued from p. 557.)

ASCENT OF CHOKAIZAN.—Acting on the advice of Professor Sargent, of the Arnold Arboretum, U.S.A., I made an excursion in the autumn to Chokaizan, situate within a short distance of the Sea of Japan, in northern Nihon. Thanks to the services of a jurickshaw company I arrived in three days at the foot of the mountain, and put up in a small fishing hamlet.

Twice I have met with these companies, and find them good, relays of men every few miles. On one occasion we did 55 miles in one day, including a high mountain pass; and on another 10 miles in one and a quarter hour, an average of 1 mile in seven minutes.

On these occasions the roads were trunk roads or "kokudo." I was once on a country cross-road or "rido," and took four and a half hours for 12 miles, despite the exertions of two powerful fellows. Another advantage, and an important one appertaining to the main trunk roads worked by the companies, is the certainty of always obtaining men. On one occasion on a side road I arrived in a village, and found that an M.P. on the previous day in the course of an electioneering tour had passed through and taken every coolie the place possessed; on another I required four men, but I was told the road was so bad that eight were necessary—only two being obtainable, my luggage and boy (interpreter and cook) had to fall back on pack-horses.

At the best, a day in a jurickshaw is fatiguing, over 6 inches deep of loose sand and stones, as along the west coast line it becomes somewhat exhausting.

A few miles on is Sendain, noteworthy for the manufacture of articles more ornamental than useful, from fossil-wood found in a hill close by. The native name is jindaisugi, the wood in all probability being *Cryptomeria*. I obtained several examples, as well as a piece of fossilised Pine, and a roll of cloth, called shifu-ori, made from silk and paper, and suitable for hot weather, the plant from which the paper used in this cloth is obtained is *Broussonetia papyrifera*. A somewhat high range of mountains is crossed by a pass kept in perfect condition. This range runs through the centre of the island almost unbroken, from Shiznoka on the south coast, to the most northern point. Twice I crossed it; once en route for Chokaizan, between Sakunami and Sekiyama, and again on the return journey to Kurosawajiri, shortly after leaving Yokote. On both occasions I was struck with the extreme beauty of

the scenery, and the richness of the varied deciduous vegetation. The road, in perfect condition, running along the sides of the hills, and frequently hewn out of solid rock, passes through narrow valleys and deep ravines, every turn revealing fresh views. All sides are shut in by steep and inaccessible mountains, clothed with the densest deciduous forest, from the banks of the torrent below to their very summit. *Acer palmatum*, *Styrax japonicum*, *Quercus serrata*, *Viburnum*, *Berchemia racemosa*, and tall handsome specimens of *Esculus turbinata* and *Magnolia hypoleuca* were all seeding freely. Beyond Sekiyama and as far as Moto-Aikai, on the banks of the Mejaungawa, one of Northern Japan's most important streams, our way lay for the most part over a wide plain chiefly under rice, now fast ripening. Villages were numerous, and bore a totally different aspect to those further south, all the houses having one end facing the street, and constructed of heavy beams and walls of mud and chopped straw. The general effect is more that of a huge barn than a domicile. The dress of the women is somewhat different, and their head-gear peculiar; a broad band is wrapt, just above the eyes, tightly round the head, and a similar one over the nostrils and mouth—a protection against dust or cold. Many of the house walls were literally hidden with strings of Tobacco

FIG. 109.—MARGOLD, DWARF FRENCH: PURPLE AND GOLD.

leaves, drying in what ought to have been an autumn sun, but there was and has been generally very little.

From Moto-Aikai to the somewhat important seaport Sakata the jurickshaws ran over the smooth undulating southern bank of the Mejaungawa, a broad shallow stream; hills on either side, with broad belts of *Cryptomeria*, made the scenery pretty. To the south lay the peaks Haguro-san and Ewasan, the latter (the highest) being some 6200 feet elevation above sea-level; curious as being connected with a non-existing mythical third, the three together being known as San-zan, "the three mountains." The non-existing peak bears the name of Tudono-san, is marked on Japanese maps, mentioned in some European books; sign-posts point to it, its ascent is discussed by pious pilgrims, but, on the authority of the Imperial Survey Department, it does not exist. I of course asked for it, and a direction was pointed out; but when I hinted my doubts, my "boy" (a Tokyo man) laughed, and said no more. Since then I have met with the following statement:—"Though not in itself a mountain, it is a hollow on the shoulder of a mountain called Umba-ga-tuke. This spot is considered sacred, and is a goal of pilgrims. Those who affirm and those who deny the existence of the sacred mountain would therefore seem to be equally in the right, as the question turns on the definition of the word mountain, or, rather, of the Japanese word san."

From Sakata (where I purchased old lacquer at prices laughable when compared with those at Tokyo and elsewhere frequented by wealthy Americans and globe-trotters) it was but a short way to the village of Fukura, where I had decided to stay. Skirting the sea-shore, for the most part beneath fine plantations with little or no undergrowth, Chokaizan looming in the north, I was deposited one soaking-wet afternoon, in a small hamlet of some half-dozen habitations. Fortunately a hot spring had given an excuse for a fair inn, and during my stay visitors were not infrequent. A dreary place this Fukura—not a chicken, hence I went eggless. Fortunately, I had ample supplies.

The afternoon I spent wondering where and how I was to begin, not a particle of reliable information was obtainable; it is pretty easy to talk of doing a mountain, but when you start for a great mound 100 miles round at its base, the prospect is apt to be overwhelming. However, before I left I worked the south, south-west, and south-east slopes, rendered far easier, as there was not a tree above 700 feet, only low scrub.

Chokaizan is 7100 feet above sea-level, but the slope is so gradual, the distance to the summit is considered to be 9 ri. (1 ri. = 2.44 miles). The first recorded eruption took place A.D. 861, the last, an insignificant one, some thirty years ago; its volcanic force is said to be becoming extinct. Immediately behind Fukura the undergrowth in parts is almost entirely composed of *Quercus dentata*, low bushes, cut down for fire-wood. I first ascended from Fukura, the usual route, but soon perceived there was little worth the trouble, low shrubberies of *Quercus*, *Lespedeza*, *Eucalyptus*, &c., entwined with *Vitis labrusca*, *Pueraria*, and other creepers. Woodcutters were busily at work. At some 600 feet I was able to obtain a more general idea of the vegetation of the mountain. Below stretched the plain, dotted with villages partially hidden by groves of *Zelkova*, *Diospyros*, *Camellias*, *Cryptomeria*, *Bamboos*, *Oaks*, *Mulberries*, &c. It was, I may say, entirely under rice, from the lower slopes of the mountain to the Pine-belt lining the seashore.

To the south-east and east were numerous groves of Pines, which I subsequently found to be singularly fine, and two long lines of dense deciduous vegetation, evidently along the banks of mountain torrents. One, the most easterly, extended to a wood, in the recesses of which lay buried a Buddhist temple. Here the vegetation was richer than in any part visited, and I spent, as far as the weather would allow, the best part of two days in and round this wood. Fairly easy of access, through the numerous woodcutters' trails, it was yet, apart from these, frequently impregnable. The banks of the torrents were so steep that it was only by clinging to the Bamboo and other undergrowth one could descend. In the wood along the torrent banks, woodcutters are active, and I crossed several clearings, usually carefully replanted—young *Cryptomeria* as often as anything, the young plants inserted within a foot or two of the old stumps. I also came to a plantation, still quite young, of *Pyrus Toringo*. In the groves, and more especially in the one surrounding the temple, are fine specimens of *Elm*, *Zelkova*, *Beech*, *Rhus*, *Camellias* with stems 9 to 18 inches through; *Magnolia hypoleuca*, 40 to 50 feet high; *Acer pictum*, *cissifolium*, and quite a small forest of *palmatum* without a seed; *Cherries*, *Pyrus*, *Chestnuts*, *Esculus turbinata*, *Eaonymus*, *Linderas*, and *Oaks*. The undergrowth is rich, *Bamboos* being most frequent; in parts are a few distinct species of Ferns. I brought away some seed, but nothing of great value; the fact is, all the really good things are known and in England already.

In returning to the railway we again skirted the sea-shore as far as Akita, meeting with, as was to be expected, *Rosa rugosa*, flowering and seeding; *Juniperus littoralis*, covered with berries; a low, pretty grey *Artemisia*, and groves of rather poor Pine. From Akita we made due east. Outside the town much Rice was being harvested, the peasants standing, despite the cold, knee-deep in liquid mud, and using a short, triangular, slightly-hooked blade, on a stout handle. Tied in small bundles, the Rice is conveyed to the sides of the fields, and there hung on rough scaffolding, especially erected for the purpose, several rows deep, to finish ripening. The task of cutting is frequently left to the women, the men loading the pack-horses, &c.

On the slopes of the mountain passes, *Pueraria Thunbergiana* was being cut, tied in bundles, and hung outside the huts to dry. From its fibre rope and twine are manufactured, specimens of which I have sent home. I also for the first time saw bundles

of Utsuji, *Lespedeza Sieboldii*, stacked dry. On inquiry, I was informed that the small wooden nails required for lacquer boxes and other fine work are manufactured from its stiff branches. From Kurosawajiri, approached by a fine avenue of young Pines some miles long, destined, provided Nature does not destroy it, one day to be probably famous, I took train to Auomori, and crossed to Hakodate.

TOKYO.—A fruit and vegetable shop at Tokyo is not uninteresting at this season. The fruit represented in greatest quantity, hawked about the streets, or sold by poor and needy vendors at the corners of the leading thoroughfares, is naturally the Persimmon (*Diospyros*). Of the several varieties commonly met with, the most usual are a large pale one and a smaller variety of a deep rich orange colour. *Pyrus ussuriensis* is still met with, though its season is evidently passing; in flavour poor, in texture gritty, it would meet with but little favour in European countries. For a Pear it possesses the peculiarity of a deep depression at both ends, and is in both colour and shape not unlike a large Russet Apple. The finest variety I have met with is cultivated round Nūgata, in the north, though Auomori supplies the capital to a large extent.

A seedless Mandarin Orange, largely exported to America from Kioto; Grapes from the fertile plains of Koshu, Figs from the districts surrounding Tokyo, Pomegranates, just bursting; Chestnuts, the choicest of which hail from Tamba, are met with everywhere.

Lilium tigrinum bulbs, scraped white, and kept in water, look appetising, and when boiled are very sweet. Roasted locusts in a tray close by were not so attractive, nor is one tempted by the solid tubers of *Colocasia antiquorum*. Dried Plums, small yellow Chrysanthemums for salad, and Ginkgo seeds—the latter a dish for epicures—are amongst those often seen.

In every street are sacks and bags of *Phaseolus radiatus*, which, when crushed to a pulp, forms one of the chief ingredients of the countless Japanese sweetmeats.

Vegetables, supplied by the same vendor of locusts and Persimmons, are large, but I should imagine coarse, with perhaps the exception of the Gurken; beautiful miniature Cucumbers, Beans, Carrots, Turnips, Onions, and Horseradish, are all fine, but the palm must undoubtedly be given to the Sweet Potato. Costing but $\frac{1}{2}$ sen per pound retail (i.e., considerably less than $\frac{1}{2}$ d.), it is cheaper than Rice—an invaluable food for both man and cattle. It yields excellent starch and alcohol, and for a change is sometimes preferable to the ordinary varieties. Handsome it cannot be called; long, round, tapering at either end; in colour a dirty crimson, each tuber looks as though it were dying of apoplexy. *James H. Veitch*.

CHICAGO.

CHRYSANTHEMUM SHOW.

THE "fair" proper came to an end in the midst of general depression, owing to the shocking murder of Mayor Harrison, and, in consequence of the confusion prevailing at Jackson Park, that location was abandoned by the managers of the Chrysanthemum show, and a new site chosen but two days before the opening of the show, the choice being the Art Institute on the Lake Front, where the World's Fair Congresses were held during the summer. There is no doubt that this change redeemed the show from failure to success, for out at the Fair, in spite of promises made by the directors, the Horticultural Building was in a state of general upheaval, electric-light wires cut out, and roadways blocked by trucks and railway tracks. Visiting the Fair two days after its official close, I was amazed at the turmoil it presented; apparently the only thought of the exhibitors was how to get away in the shortest possible time. The directors, however, still charge full rates of admission to this scene of confusion, which looks like the property-room of a gigantic theatre.

The best display at the show took the form of cut flowers and seedlings, the plants being generally poor, excepting in those grown to single stem and flower. The show represented a very wide range of territory, extending from New Orleans to Canada, and from San Francisco to Boston; while the pre-

sence of M. Crozy's new hairy white *L'Enfant des Deux Mondes*, and the amber sport from Vivian Morel, Chas. Davis, which I notice is a feature in English collections, gave the display an international character. There was not a single flower displayed on a board, this form of staging being very rare at American shows; they were all arranged in vases on long stems, the shortest being 12 inches, while other classes called for stems 18 inches to 3 feet. The great advantage of this system is, that size and quality of bloom alone cannot be considered; stem and foliage are material points in the display.

The class calling for vase of fifty blooms was superb, the 1st prize going to J. C. Vaughan, of Chicago, for a magnificent vase of *The Queen*, a large loosely-incurved white, new; this variety also received 1st for vase of one hundred blooms, and vase of twelve blooms, white. This variety is regarded as the most promising new white for exhibition and commercial purposes, surpassing *Niveus*, the great prize-winner of last year.

In the class of fifty blooms in vase, yellow, Mrs. J. G. Whilldin was the winning variety; in the same class, pink, *Beau Ideal* and Mrs. Higinbotham, two new seedlings, large and incurved, and *Mermaid* were combined; white in the same class, crimson, Geo. W. Childs, was favoured.

The largest number of prizes went to E. G. Hill, Richmond, Indiana, both in cut flower and seedling classes. He exhibited *L'Enfant des Deux Mondes*, which was put 2nd to *The Queen* for vase of fifty; Chas. Davis, the first appearance here of that variety; Robert Owen, and a number of his own seedlings. He received the 1st prize, one hundred dollars for best seedling on exhibition not yet disseminated, the winner a huge globular yellow, named *Challenge*; it is extremely full, very robust in growth, and clear sulphur-yellow in colour. The same exhibitor received 1st in the class for yellow seedling with *Eugène Dailledouze*, which may be described as a mammoth Kioto, with broad incurving petals of bright yellow. The same exhibitor also received an Award for *Inter-Ocean*, which may be described as a creamy-white *Vivian Morel*. Another new yellow which received special award was *Major Bonnafon*, a superb flower, shown by Fred Dörner of Lafayette, Indiana.

A Californian seedling which caused much comment was Mrs. J. Geo. He, a ball-like white; it is of remarkable substance, bearing the long journey from the Pacific coast without any injury. *Pitcher & Manda*, a seedling raised by the firm of that name, showed a remarkable break; it was a large flat flower, the centre petals yellow, the outer ones forming a ring of white.

The present taste in America is for globular incurving sorts, and the raisers of new seedlings are bending their energies in that direction. Ivory is still held as one of the best commercial whites, and was shown in fine form here, but it was excelled by *Marie Louise*, a new seedling of similar form, but purer colour and narrower petals. Very few of the hairy type were shown; Mrs. Hardy is generally thought an unsatisfactory grower, while the livid colour of *Louis Böhmer* is objectionable. *L'Enfant des Deux Mondes*, while generally admired, did not create much enthusiasm.

Among amber or tawny shades, Charles Davis was perhaps the most admired variety; in pink, *Vivian Morel* appeared most frequently, and in crimson Geo. W. Childs was most prominent. Ed. Hatch, much admired last year, was coarse and streaky as seen here, but *Eta Præss* fulfilled all last season's expectations, and the same may be said of *Harry Balsley* and W. R. Smith.

In addition to the Chrysanthemums, there was a fine show of Roses, renewed day after day, and many baskets and table decorations. The entire premium list amounted to 6000 dollars in money and forty Columbian medals.

Among further awards from the World's Fair we note F. Sander & Co., for *Dracena Sanderiana*. The final lists of awards are not yet revised, and the department is in a quandary because they have not medals enough to go round. Congress issued an

appropriation for 50,000 medals and diplomas. The judges, however, have far exceeded this number, and the Commissioners are undecided whether to ask Congress for another appropriation—which they are very unlikely to get, or whether to ask exhibitors to be content with one medal and a batch of diplomas, where more than one has been awarded. This seems rather small, but the awards mean very little, and the entire Department of Awards has received more serious criticism than any other section of the World's Fair. *E. L. Taplin, Chicago*.

"TAKING" THE BUDS OF CHRYSANTHEMUMS.

THIS is a term that has taken root in the jargon of cultivators of the Chrysanthemum, and it will doubtless remain. We have all had to make a beginning in our course of practice, and it may be thirty or thirty-one years since I made a start on my own responsibility. I had a fine lot of plants, which had been grown without any intention of exhibiting; and I knew nothing about "taking" the buds, but I happened to be honoured by a visit of a secretary of a Chrysanthemum Society, and he was good enough to say, "What a splendid lot of plants you have, but you must begin to 'take' your buds;" so I had a lesson in bud-taking. The flowers, I may say, were all of the incurved varieties at that time. I was asked to exhibit, which I did, but I found that my flowers, which I thought were good, lacked "finish." I had tried my hand at dressing, only to fail the first time, but afterwards was fairly successful. But I found that, in growing Chrysanthemums, as in growing Carnations, there was no chance to win with badly-grown flowers, and I also found that there was no chance to win unless the buds were taken at the right time. A quarter of a century ago, managers of flower-shows had an idea that the third week in November was the best time in which to hold them. Now they are mostly over by the middle of the month, and they begin in the first week. As far as I can see, it all resolves itself into a matter of taking the buds.

I was quoting from memory when I referred to *Queen of England* lately, and varieties from it, as a suppositious case, and must have confused the experience of years ago, with the necessity of obtaining blooms for exhibitions two weeks earlier. *Queen of England* and varieties of it are the mainstay of the exhibitor who shows cut blooms. If these fail, his case is hopeless. Our method of growing the *Queen of England* type during the last year or two has been to divide them into two sections. The *Queen of England*, Alfred Salter, John Doughty, and Mrs. Robinson King, should be stopped about the third week in May. *Empress of India* and *Lord Alcester* are not stopped at all. Something also depends upon the time of putting in the cuttings. We began on the 17th of last month, but not with the *Queen of England* type, which are put in six weeks or two months later. Stopping the shoots in May causes the crown buds to form as near as possible to the last week in August and the first week in September. The *Princess of Teck* and varieties raised from it are treated altogether different. The cuttings are put in about the middle of November, and I may say, that we strike all our cuttings under glass-lights in the cool *Orchid-house*, and seldom lose one of them. We have begun now, and will go on until March. The *Princess of Teck* varieties are *Hero of Stoke Newington*, the first sport, Mrs. Norman Davis, Lord Eversley, Charles Gibson, and Lady Dorothy. These also make a strong point in a stand of twenty-four blooms, but they are only good for the front row. I should add, that in all cases one cutting should be planted in the centre of a small flower-pot, so that the plants may, when well-rooted, be shifted into sizes larger without injuring the roots. Stop the plant in April, and select three growths, each of these will make another break in June, but grow up one shoot only from each of them, and buds may be expected to form about the last week in August. Take the "crown" buds at that date, and it is rather remarkable that

buds taken at that time, or even in September, will flower sooner than those taken the first week in August from a crown bud. Next in importance to the Queen of England and its varieties, and superior to the Princess of Teck type, is the Princess of Wales and sports from it, including Mrs. Heale, Violet Tomlin, Miss M. A. Haggas, Mrs. Coleman, and a later deep yellow, Richard Parker. We strike the cuttings of these in January, and they are grown on with a single stem until each plant produces three growths naturally, and we like to see the buds set about the middle of August.

Prince Alfred, and its reddish-brown sport, Lord Wolseley, are two sorts which require careful handling to get the bloom late enough. Cuttings should be put in late; if they are put in as late as February or early in March, they will sometimes produce the best blooms. They should be stopped in May, after the three shoots have started. Grow one shoot from each, the object being to retard the production of the crown-bud, which it will do by two or three weeks, bringing the time of bud-taking to the last days of August, which is a good time.

Lady Hardinge is a good old sort, which has held its own as long as I can remember; and the buff sport from it, Mrs. Shipman, which has also been much valued by exhibitors, but it is now surpassed by Madame Darrier. Put in the cuttings about the middle of November, or as soon after as possible. Run up one growth only, and let it break naturally into three. Take the crown-bud about August 26.

Jeanne d'Arc is a good exhibition variety. Stop the first week in June, and the growths from this stopping will form a crown-bud about the end of August. M. R. Bahuant is a distinct and very fine variety, with blooms of the Queen type; our blooms this year were not full nor of good substance, taken from what the growers call terminals started when the crown-bud showed in the second week of August. John Salter and the golden-coloured sport from it may be treated like the Queens. Take the buds about the last days in August, but it is a difficult type to grow well. The opening flowers should be placed close up to the glass roof in a good light. The above remarks have taken in nearly all the best exhibition varieties. I have not yet grown the new incurved variety Baron Hirsch, but have already bought it, in the form of cuttings for next year; we can only take our notes from cuttings put in on the 17th of this month, but very likely the tops will be taken off and struck in the spring. It is an excellent incurved cinnamon-coloured variety.

The Japanese varieties do not require so much care as the incurved sorts; but really good exhibition blooms cannot be obtained unless the crown buds are timed well. Take for instance the well-known exhibition varieties Sunflower and Edwin Molyneux: we stop these in March, and train up one shoot only; allow them to break naturally into three growths, and take the crown-buds about August 18. The question may be asked, why stop such varieties as Edwin Molyneux in March (say the third week in the month)? The reply is, simply to retard the formation of the crown-bud, for if it is allowed to break naturally, the buds form too early for the dates of the exhibitions, and flowers obtained from terminals are not good enough; but if stopped, say, March 20, and one shoot only trained up, the usual three growths will be produced later, and the crown-buds can be taken about August 18 or 20, in good time for the blooms to grow to the largest size and rich in colour for the exhibitions, instead of the colour being faded and the flowers past their best, which they might be if this stopping had not taken place.

The above remarks apply to varieties that flower early, and which cannot be grown to exhibition size from the terminal buds. Mrs. E. W. Clarke may be selected as the type of a late-flowering variety, and this can also be brought into bloom at the right time by stopping. The plants break into three growths in June, but the crown-buds from these would not form in time to give good blooms early in November. The procedure is this—pinch the point out of the plants early in April. New growths

are produced at once, and each of these must be trained up in the hope that the crown-buds will be formed about the second week in August, which will be a good time to obtain exhibition blooms the first week in November.

It is needless to lay down a hard-and-fast line, for one cannot grow Chrysanthemums by square and rule, and even the best cultivators have to consider their work daily and weekly, not only as to taking buds, but as to striking cuttings, re-potting the plants, surface dressing after re-potting, &c. The past season has been as fickle as any that the oldest growers have ever experienced. And good growers in different districts obtain equally satisfactory results by working in opposite directions. One of the best growers advises putting in cuttings of the Queen of England type in December; but I once

FIG. 110.—SUNFLOWER, LORENZ'S MILFLOWERED: HELIANTHUS MULTIFLORUS VAR.; COLOUR OF FLOWERS DEEP YELLOW. (SEE P. 715)

saw six faultless blooms in one stand of Lord Alcester, which were produced from cuttings struck in March. They easily won first the prize in a good competition.

In reference to my remarks recently, Mr. Brian Wynne kindly writes to say that the term "crown bud" was first used by the Liverpool growers some fifteen years ago, and that a discussion took place thereon in the *Gardeners' Chronicle* about that time. It is not a matter of apreme importance; but most growers know well what "crown bud" and "terminal bud" mean, and also how to take them. *J. Douglas.*

CHRYSANTHEMUM BUDS.

The most suitable time to leave the buds of Chrysanthemums so that they will develop into handsome blooms—that is, when grown on the three bloom principle—is certainly to many people most perplexing. Even amongst the most experienced growers there is a difference of opinion, so when these disagree, it makes it more perplexing still for the less experienced to know what to do with certainty.

True, there cannot be any fixed rule, as witness the past season, as by following the orthodox rules, many varieties certainly were spoiled for all good purposes. Seasons, therefore, have to be taken into consideration, for no man can tell in advance how the season is going to turn out, whether it is to be an early or a late one, with an abnormal amount of sunshine on the one hand, or an undue amount of wet on the other. If we knew this, the plants could be so arranged that the buds could be induced to show at the most suitable date, so as to ensure perfect and well-coloured flowers. Others, again, seem to come better some seasons than others, like *Roses* for instance, and yet the cultural details appear similar. Others, again, are more constant, and differ but little, whatever the seasons. Again, some varieties, especially amongst the Japanese, have to be experimented with, to know what to do for the best. Some of these, if the buds are set too early, come coarse, but, if allowed to run on to what the majority of gardeners now recognise as the terminal, are too small for any purpose, whether for exhibition or home show. Even where the smallness of bloom is objected to, the additional height is, as with some varieties, the running on to the terminal, means an extra 3 feet in height, and this, for those people who may have not the structure to accommodate these tall plants, is a serious objection. This much I do know, that those people who care for Chrysanthemums not merely for exhibition, but for the embellishment of the conservatory or greenhouse, look upon these tall growers with extreme disfavour, and in some cases the edict has gone forth that they will have no more of them. Taking a flower as a flower when cut, the majority of people would favour a smaller but well-formed and good-coloured bloom, to coarse early ones.

My opinion is, and I have further proved it by experiment, that with many varieties the growth must be checked by stopping in March if good-formed and well-coloured blooms are to be secured from the "crown" buds. Take Sunflower, for instance, or even Stanstead White and Avalanche, these, if grown on to the terminal before the buds are set, will only produce small and worthless flowers. Sunflower, whatever the season, I should stop the third week in March. From this stopping, one growth would be taken up and allowed to grow on and branch out in the ordinary way, and then select the three crown buds. Stanstead White and Avalanche I should only operate upon a part of the plants, as if by chance the season should turn out late, the crown buds would show rather too late to secure perfect flowers, although considerably better than terminals. Edwin Molyneux should also be stopped in March, whatever the season; this variety has been grand this season without exception, although the buds showed in a manner differently to that which is usual. For instance, the plants, although stopped in March, showed the crown buds too early, but this was exceptional, and must be attributed to the season. The shoots, therefore, were allowed to run on, and the next buds taken, when the whole of the plants, without exception, produced the handsomest flowers for the variety I ever saw. In this case, what is ordinarily known as the terminal buds, produced good flowers, but these showed during the third week in August. There are two other varieties which require more exceptional treatment still so as to produce good flowers, and those are Miss Falconer Jameason and J. Stanborough Dibben; these should be topped about the third week in March, and then allowed to form two or three shoots, and from these shoots take the first buds which show. These buds will produce perfect flowers, of good colour, and be in perfection throughout November. This, I know, is different to the usual way of treating Mrs. Falconer Jameason, but it produces a later flower, and also a better shaped flower, and of much deeper colour than if allowed to grow on without topping, and taking the first bud which shows. I have not touched upon the incurved, as no doubt that experienced grower and old exhibitor and judge, Mr. Douglas, will respond to the editorial invitation. *A.*

FLORISTS' FLOWERS.

ANEMONE-FLOWERED CHRYSANTHEMUMS.

The large Anemone and Japanese Anemone varieties have been shown well this year at the exhibitions, and perhaps these classes will be better represented in the future. Two new kinds were exhibited recently, one a small Anemone variety, named Mrs. C. J. Salter, and a fine Japanese Anemone kind, W. W. Astor. The former is a cross between Scarlet Gem, a neat, formal single flower; and Nelson, which belongs to the Japanese Anemone section, and has purplish-crimson flowers. The outcome of this parentage is a pleasing buff-coloured kind, the bloom very neat and distinct. W. W. Astor is a promising variety, the flowers large, guard-florets of a bluish tint, and the disc yellow shaded with rose. So many new varieties are raised now, that the utmost care must be taken in selecting. Of the Anemone class very promising are amongst the later acquisitions, E. C. Jukes, purplish-magenta, the centre of a golden colour, with regular guard-florets; Mdlle. Nathalie Brun, white or sulphur-white, a distinct shade; and Mdlle. Paula Lefont, rosy-white, with gold-shaded centre. The most beautiful of this section is Delaware, which has been shown well; it is pleasing on the plant, which is not always the case on show Chrysanthemums, the flowers large, well-shaped, and the guard-florets white, the disc delicate yellow. The Japanese Anemone class verges in many cases close upon the other section. Three good new kinds are Duchess of Westminster, which has the characteristic long petals, the colour bluish, and the disc is rose suffused with a bronzy shade; M. Dupanloup, rosy-violet, the disc tipped with rich gold, and Rodolphe Rag'onière, a delicately coloured flower, the guard-petals long and rosy-white. We should like to see more kinds of the character of Fabian de Mediana, in which the guard-florets are of very great length, longer than in any other variety, and of bluish colour, the disc purple. The Anemone-Pompon Chrysanthemums, like the others, have been more largely shown than usual, and we hope to see many new varieties added to them. Emily Rowbottom is one of the best of the more recent kinds. It is a sport from Marie Stuart, a well-known variety, raised by the celebrated John Salter in 1866. It is like the parent, the flower of excellent form and creamy-white, useful both at the exhibition and for cutting.

CHRYSANTHEMUM, WHITE LOUIS BOULEMÉ.

From what we can see of this variety it is far better than the type, Mrs. Alpheus Hardy, which is uncertain, usually making very poor growth. The flowers are large, full, and open, a soft primrose colour passing to purest white with age. It is vigorous in growth, free, and retains all the good qualities of its parent, without its dull colour. *Enfant des deux Mondes* is a synonym.

CHRYSANTHEMUM MDLLE. THÉRÈSE REY.

This is a splendid Japanese variety, and this year has been exhibited finely in several stands. The flowers are refined, and very large, as is necessary now for a show bloom. They are creamy-white, the petals broad and incurved somewhat. It is the first novelty in this class of recent years. *J.*

OUR OLD-FASHIONED PINKS.

The old laced Pinks of the florist, which have been more or less popular with some florists for pretty well three-quarters of a century, are now creating a fair amount of interest, and many are taking up their cultivation; varieties greatly improved in form have been from time to time introduced, and recently several new kinds of considerable merit have been added, and exhibitions of the florists' Pinks have been organised.

There is not one of our hardy flowers which more deserves recognition and encouragement, and gives less trouble, and its fragrance generally adds another substantial reason why it should be grown. The old system of raising plants by pipings (i.e., cuttings from the side-shoots) has existed from time immemorial. I have in my early days spent many hours—I may say, days—in making pipings, and placing them firmly and close together under hand-glasses, in sandy soil, in a shady position, and not removing the square hand-glasses until they were struck; but here, in the neighbourhood of Birmingham, our best Pink growers layer the plants as they would Carnations, and have abolished the system of raising from pipings. Well, there cer-

tainly is a very great advantage gained in securing strong, healthy, well-rooted plants at the end of September for planting out, with a certainty of getting them well-established, and able to resist severe weather; not but the Pink is a perfectly hardy plant when well established, but it is so often the case that weak plants are planted out in November, with no chance of their getting established and strong before winter sets in.

Of the laced varieties, those which have a white ground colour, with purple, or shades of rosy-crimson edgings to the petals, with a dark blotch at the base of each petal, the following are some of the finest:—Amy and Ethel are two very fine flowers, raised by Mr. Brown, of Handsworth, Birmingham, and recently introduced; and Amy is the finest of all the Pinks grown. Fellowes' Rector is another very fine flower, and a great acquisition; Mrs. Fred. Hooper and Harry Hooper are also two fine varieties, raised at Bath; Bertha, raised by Mr. Paul, at Paisley, is another first-class flower; so also is Fellowes' Favourite, quite new, and most promising; Empress of India is a gem, very bright in colour; and Turner's Boiard, Turner's Godfrey, and Turner's John Ball are three good old sorts; Paul's Modesty is a very refined flower, and first-class; and three other flowers raised by Mr. Fellowes should be in every collection, viz., Minerva, Rosy Morn, and Princess Louise; and Brown's Mrs. Dark is a good useful flower. These are all varieties which are grown for exhibition purposes, still all are good telling varieties for border decoration.

As border varieties, we now have several excellent varieties of recent introduction to be added to such old kinds as Pheasant-eye, the old Paddington Pink, Anna Boleyn, and others. Mrs. Sinkins, a white Pink, soon became very popular as an improvement on the Old White, but this was superseded in quality and form by another fine white self, named Her Majesty, and this again is beaten by Mrs. Lakin, raised by Mr. Joseph Lakin, of Oxford, and is the best white Pink grown, and a fine market and decorative variety. But the Old White Pink must not be despised, for it is such an abundant bloomer, and delightfully fragrant. Lord Lyons is a very fine bright rose-coloured variety; and Derby Day, Beauty, Mrs. Barlow, and Heath's Beauty are all desirable varieties, and all more or less fragrant.

Whilst on the subject of Pinks, the large genus of *Dianthus* opens out a wide field to hybridisers, and as an instance of what can be done by cross-breeding, the Marguerite Pinks have been taken in hand by a Birmingham florist, and crossed with the florist's Carnation, and the experiment has resulted in improved form of the flower, with the habit of the Carnation, and the early-blooming properties of the Marguerite Pink, plants flowering freely in six months after sowing the seeds. Our fine varieties of Mule Pinks are hybrids, and very lovely things they are; and the whole range of the *Dianthus* genus embraces a great variety of form, habit, and colour, and all more or less beautiful. *W. D.*

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By M. TEMPLE, Gardener, Carron House, Falkirk, N.B.

PINES.—The greatest care should be exercised at this season of the year in applying the requisite heat and moisture, for excess in any form causes irreparable damage. Dripping of condensed moisture from the roof must be avoided. Plants which are now to be forced for fruiting during early spring should be allowed more heat, and if they have been well rested, and the pots are full of healthy roots, 70° at least may be given, with a rise of 10° from sun-heat; bottom-heat should be 85° to 90°, and water given with care at a temperature of 90°—excessive moisture in any form is injurious. The state of the weather, and the amount of fire-heat required, must determine the amount necessary. Plants forced to show fruit by extreme dryness at roots and a high temperature, give a poor reward for the labour expended on them. Plants for later succession need not have a temperature higher than 55° to 60°. Those which are swelling their fruit should not have lower atmospheric temperature than 70°, and 85° to 90° at roots. These will require looking over frequently in order to prevent the roots from becoming too dry, and at all times a healthy moisture in the atmosphere must be maintained.

VINES.—Until the buds of Vines which are now starting are pushing, the temperature need not rise

above 55° in absence of sun, when an increase of 10° may be allowed, but when growth has fairly started, an increase to 60° may be maintained at night, except during severe weather. Syringe the Vines twice or thrice daily with water about 85°, and give a supply to the roots at about 90° if they require it. Where manure is used to induce moisture, let it be turned frequently and damped. Roots in outside borders should have a temperature of about 60°, and be kept well covered by litter and leaves. Bracken is excellent for this purpose. Vines in succession-houses should also have their roots protected, and be otherwise prepared for forcing. Till the houses are closed, the atmosphere should be kept thoroughly dry and cool. Though some take off the lights in order to thoroughly rest the Vines after they have shed their leaves, I do not advise the practice. Pot Vines require careful application of moisture at the roots; water about 85° should be given, and the plants should be thoroughly watered. Gentle forcing gives the best results, and when days are longer and sun-heat is more abundant, time can be easily made up with advantage to the Vines—55° to 60° from fire-heat should not be exceeded. Vines in pots which are cut back and are to be forced early next year may have the drainage put right, and be surfaced with rich soil ready to be started gently into growth, and when grown early they can be forced to fruit with more certainty. Cuttings of Vines from which eyes are to be taken to supply young plants should not be allowed to become dry. When they are removed from the Vines, they should be kept in damp soil till wanted.

CUCUMBERS.—Where regular successions of Cucumbers are in request, the present time is favourable for sowing seeds of a good early variety. Use sweet turfy loam, with a third of good leaf-mould in which to sow the seeds, and cover them lightly, giving little water till leaves are formed. Keep them near the glass in a temperature of 70° to 75°. If fermenting manure is used, it should be rendered sweet by being often turned before the bed is made, and careful attention that rank steam is not confined about the plants must be given. Cover the glass well with mats or frigi-domo.

PLANTS UNDER GLASS.

By BAILEY WADDS, Gardener, Birdsall Gardens, York.

DIANTHUS PUNICEUS VAR. MAGNIFICA.—This plant will now require liberal supplies of manure-water to help it to flower freely; it is one of the most useful flowering plants if kept clean from red-spider, which may be done by syringing it well with petroleum emulsion or Lemon-oil. If the plant can be allowed to grow over the paths on arches or festoons, its bright-coloured blossoms can be the more readily seen.

BRUGMANSIAS.—These plants, if grown in pots, should now be well pruned-in, and placed behind the stage, or in a shed from which frost is excluded; and if kept dry at the root they will be quite safe until required for starting in the spring. Those that are potted out in warm conservatory or corridors will continue to grow and flower throughout the winter, if kept supplied with water.

MANDEVILLA SUAVEOLENS should be well pruned-in, whether growing in large pots or planted out in borders, and it must be kept well up to the light; the plant must be kept rather dry during the winter. The past season was favourable for its flowering, as it enjoys plenty of sun-heat and fresh air, but a frequent use should be made of the syringe to keep red-spider under.

NERIUM OLEANDER AND N. O. ALBUM, when grown in cool-houses, should be kept rather dry during the winter, but sufficient water should be afforded to keep the foliage green and in condition. Very tall plants may be cut down, only leaving some of the green shoots which spring up from the base. Neriums grow well, and flower abundantly when planted out against a warm wall in the greenhouse or the conservatory. In the growing season the plants enjoy heat, air, and much moisture at the root. To rid the plants of brown-scale, syringe them frequently with an insecticide, laying pot-plants on their sides.

CHOISYA TERNATA.—Some plants of this sweet Hawthorn-like flower should be placed in the forcing-house, they being most useful for house-decoration. They flower abundantly if planted out against a wall or pillar in a cool-house.

ROSES IN POTS.—The H.P.'s, Teas, and other varieties which may have been placed in heat at the beginning of November should have a slight increase

of warmth, the bottom-heat being kept up to about 70°, and air admitted on mild days as much as possible, at the same time avoiding draught, syringing the plants before the flower-buds begin to assume colour, with the same composition for the destruction of mildew as that previously recommended for the Chrysanthemum. If green-fly be present in ever so small numbers, fumigation with tobacco or its preparations, or syringing with Quassia-water, must be practised, and liquid-manure liberally applied. A temperature of from 55° to 60° by night, 65° to 70° or 75° by day, with sun-heat, at the same time fresh air being admitted. Introduce into mild heat another batch of plants, plunging the pots in a gentle bottom-heat, with the temperature of the house maintained at 45° by night, 55° by day, for a fortnight. If the soil is dry, afford the plant a good watering. As an illustration of our variable climate, on November 30 the weather was fine and mild, without any appearance of frost being imminent, but December 1 opened with snowstorms, the thermometer not rising above 30° by day, and falling at night as low as 9° or 23° of frost. It is on such nights that the least neglect of the fires leads to disaster. The plants growing in the borders of the Rose-house should be closely examined at short intervals for mildew and aphid, and preventive means taken if either be observed. Dry borders should be dressed with some inodorous manure previously to being watered.

THE ORCHID HOUSES.

By W. HOLMES, Gardener, Puckering Lodge, Timperley.

MASDEVALLIAS, ETC.—These moisture-loving plants will now be growing freely if the house they occupy is kept at a temperature of about 50° to 55° at night, with a moist atmosphere generally, a plentiful supply of clear rain-water at the roots, and air freely admitted whenever the weather permits, especially keeping the ventilators near the floor open, provided the incoming air at first is brought into contact with the hot-water pipes. It is a mistake to try to cultivate these plants successfully in a temperature much lower than that given above, and when they are kept moist, and a lower temperature is maintained, the spotting of the leaves in some collections of these plants, and which mostly shows itself on the under-side of the leaf is likely to occur. This remark applies more particularly to *M. Harryana*, *M. Veitchii*, *M. ignea*, *M. Davisii*, and others of that section, these suffering more than others. The larger amount of fire-heat now required is apt to cause an increase of thrips and red-spider, and the plants should be frequently examined for these insects. *M. tovarensis*, now in flower, is a useful species, and none is more free to flower; it begins by opening its flowers on the old stems, and these are followed by those on the new flower-spikes, which fact shows it to be a mistake to cut off the old flower-spikes. *M. ignea*, also free-flowering, will soon open its flowers, and this plant, together with *Sophranitis grandiflora*, *Mesospidium* (*Cochlidia*) *vulcanica*, and *Odontoglossum crispum* make a good display at this part of the season, resisting fogs better than most Orchids.

ODONTOGLOSSUMS.—*O. Rosei* and *O. Cervantesi* are species that may be grown with the *Masdevallias*, and should now commence to flower. These require water abundantly at the roots, so that the flower-spikes may be strong and the duration of bloom increased. *Oncidium cheiroporum*, a charming little plant, is opening its flowers in the *Masdevallia*-house. The cooler end of this house, which may be 5° cooler than any other part of it, forms a suitable place for the plants of *Oncidium macranthum*, *O. Loxense*, *O. undulatum*, *O. superbiens*, *O. Marshallianum*, *O. tigrinum Barkerii*, *O. cucullatum*, and *Odontoglossum ramosissimum*; which may all of them have the stage between the pots and the pots themselves moistened once a day. The gardener must have a sharp eye for yellow thrips, for if they gain access to the new growths they soon disfigure them. Plants of *O. tigrinum*, if in flower, should be allowed to open all their blossoms, and then the spikes should be cut off. This practice saves this and other species of *Oncidiums* from being weakened, and the quality of the bloom lessened.

PLEIONES.—*P. lagenaria*, *P. Wallichiana*, *P. maculata*, the last to finish flowering, may be repotted when the flowers have faded, and roots are extending from the base of the new growths. If the operation of repotting is much delayed these roots get broken. Plants that were repotted last need not be repotted this season, provided the potting materials are still in good condition. In repotting do not divide all the pseudobulbs, but pick out the

material from among the roots, as by so doing, more bulbs may be placed in a pot or pan of 6 inches diameter than when these are separated. The potting-materials should consist of equal parts good peat, fibrous loam, sphagnum moss, leaf-mould, and a good sprinkling of finely-broken crocks, and silver-sand added, half-filling the pots or pans with clean crocks, and put a handful of sweet moss over them; and above this the pseudobulbs and potting-stuff. Water very sparingly for a time, and place in the *Catleya* or intermediate-house.

THE HARDY FRUIT GARDEN.

By T. TURTON, Gardener, Maiden Erlegh, Reading.

RASPBERRY PLANTATIONS.—The mild weather that has hitherto prevailed in the south allowed the gardener to get the stools dressed, and the canes tied to the stakes and wires as the case may be. Tall growers like *Prince of Wales* and *Superlative* should have stakes 8 feet in length, these being driven into the ground about 15 inches. The stakes are best when made from Oak, Ash, or Hazel, cut and made one year previously, gas-tarring the end that goes into the ground about 2 feet up, i.e., above the ground-line. These stakes will last from two to three years, whereas green stakes become rotten in one season unless very stout. In tying-in the canes, select four of the best to fasten to the stake, cutting away all others. Where strained wire is used, the canes should be tied-in at an average distance of 9 inches apart. Raspberries thrive in almost any good holding soil, and if the staple is light or infertile after clearing the ground of weeds and the longer parts of the summer mulching, afford it a heavy top-dressing of some strong kind of soil. This the frost will pulverise, and the roots of the Raspberry near the surface soon take possession of. In a stiff or retentive soil the old materials from hot-beds and leaf-mould well mixed together form a very appropriate top-dressing.

BUSH FRUIT TREES.—The season hitherto has been unusually favourable for the pruning of fruit trees, and assuming that all the bushes are now pruned and dressed with newly-slaked lime and soot to deter the birds, the ground should be cleared of weeds, prunings, and rubbish. It is best to get this kind of work finished before the New Year if possible; but no set time for doing this or for the preparation of the land can be laid down, as according to the nature of the land, so must the practice be; and whilst still land is benefited by being afforded a dressing of burnt refuse, leaf-mould, or any other open materials, lighter land should be pointed over with digging-forks, levelling it, and then strewing evenly over it a dressing of the best kind of holding soil that can be obtained. For black Currants, rotten manure should be forked carefully in, not injuring the roots by so doing, and if the red and white Currant bushes lose their branches, a dressing of chalk or lime will stop it, either of them seeming to impart vitality to the land.

THE FRUIT ROOM.—Precautions should be taken to prevent the temperature of the fruit-room falling below 35°, and to ensure this ventilators should now be kept close; to avoid the frequent opening of outside doors, sufficient fruit should be taken to last for several days, the door being covered up with mats or straw. Also outside walls, unless covered with Ivy or other evergreen, should be covered with Wheat-straw kept in place with twine and nails.

THE FLOWER GARDEN.

By T. H. CRASE.

HARDY FERNS AND FERNERIES.—In open weather, the re-arrangement of existing ferneries, or the erection of new ones, may be taken in hand, the deciduous species having lost nearly all their foliage, and the evergreen ones being to a certain extent at rest. Any of the Ferns may be divided, if that be considered necessary, carefully doing this, or the results will be poor next year. Lift the roots carefully, for the greater the quantity of good roots attached to the divisions of the roots the more satisfactory will be the growth in the spring. Some gardeners prefer to transplant and divide Ferns in the spring, but I prefer performing this operation at this season. Ferneries that will not be disturbed should have a good covering of tree leaves to protect the crowns from frost, all the old dead fronds being allowed to remain for the same purpose. It is a common practice to clear off these for the sake of neatness, but doing this leaves the crowns much exposed, and is a mistaken practice, the dead fronds affording great protection to the crowns, especially when the new growth begins.

BEDDING PLANTS, VIOLETS IN FRAMES, ETC., should be aired freely in mild weather, the lights being altogether removed in the middle of the day if it be warm. Remove decaying foliage at short intervals of time, and pack a good thickness of tree-leaves, Ferns, or litter against the sides of pits and frames, as high as the glass. This will do much to keep the temperature equable, and prevent frost from entering. If frost should gain an entry, sprinkle the foliage with cold water, and keep the covering on the glass for a few days, to prevent rapid thawing. These remarks apply to the hardier kinds of bedding plants; but the tender kinds, as *Alternanthera*, *Coleus*, *Iresine*, &c., should be kept gently growing on a shelf near the light in a warm house.

ROSES.—There is not a great deal to be done during this month with out-door Roses, but a few remarks may be useful. In the first place, the plants should receive a mulching of partially-rotten manure, and the dwarfs be protected by drawing the soil up round the base of plants, just in the same way as Potatoes are moulded up, and some litter should be shaken over the newly-made cuttings of Roses and Rose stocks.

BOX-EDGING.—If work is likely to be more than usually heavy in the spring, edgings of Box may be laid at this season, and it will do fairly well if plentifully furnished with roots; but as Box, when cut at the top in the winter, always turns brown from the effect of frost, laying it afresh should, if practicable, be deferred to the spring. Never touch the plants in frosty weather.

THE KITCHEN GARDEN.

By H. C. PRINSEP, Gardener, Buxted Park, Uckfield.

THE MAKING OF HOT-BEDS.—Much careful attention will now have to be expended on this kind of work, forced vegetables being usually in much request, and unless proper care be taken in their production there will be short supplies, and those not of the best quality. The leaves of trees, if raked up and stored in heaps under a covering of hurdles or litter, will have fermented somewhat, and together with stable litter form good materials for forming hot-beds, affording a mild and lasting heat; and although hot-water heating is much used for forcing vegetables, the old hot-bed formed of these materials is preferred by many gardeners. However, a good deal of care is needed in the making, and the materials should be sweetened by being heated several times, and by turning and mixing them together twice or thrice, oftener if there is much stable-dung used. When a hot-bed is made, and the lights of the frame put on, the gardener must wait a few days till the heat rises to its maximum, and if that near the surface, say, 1 foot deep, does not exceed 80°, the bed may be made use of, always, by the way, leaving a vent at the back of the frame for the escape of the vapour arising from fermentation; neglect of this simple precaution being frequently the loss of seedlings, cuttings, and the young shoots of Asparagus, Seakale, &c.

ASPARAGUS.—Another batch of roots may be placed in heat, and when lifting it, be careful not to injure or destroy the roots, as loss of roots means reduced production of shoots. Never lift the roots out of frozen ground, if it can be helped; but if it be necessary so to do, thaw the soil by placing fermenting material on it for a few days; but if covered, as previously advised, there will be no need for this extra labour.

FRENCH BEANS.—These plants will need much care, and those which are in bearing if in heated pits should have a temperature of from 60° to 65° Fahr. at night, according to the weather, lower than this rendering the pods tough. The soil in the pots or of the bed should not become dry before affording water, or growth will be checked, and red-spider and other insects increase in number.

SALADS.—A sowing should be made of Mustard-and-Cress in shallow boxes of soil made firm, the seeds being sown on the top, and pressed in. Endive, Chicory, and Dandelion roots should be blanched in a dark warm place, and for this purpose the Mushroom house answers very well. Radishes and Onions sown at the end of October on mild hot-beds will be ready for use; and Celery will now be in good order, so that there will be no lack of materials for salads.

TARRAGON and other herbs may soon be in request, and the roots should be lifted from the open ground and boxed or potted, watered, and placed in gentle heat. Parsley and other green herbs should be protected by frames, hoops and mats, or the like, as it is difficult to gather the leaves when frozen, not only so, but plants suffer much through being denuded of their foliage when frozen.

EDITORIAL NOTICES.

Letters for Publication.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for contributions, or to return unused communications, or illustrations, unless by special arrangement.

Plants, Fruits, &c., to be Named.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, DEC. 12 { Royal Horticultural Society's Committees, at the Drill Hall, James Street, Westminster.
National Rose Society's Annual Meeting, Horticultural Club.

WEDNESDAY, DEC. 13—East Anglian Horticultural Club.

SALES.

MONDAY, DEC. 11 { Dutch Bulbs, Roses, Narcissus, &c., at Protheroe & Morris' Rooms.

TUESDAY, DEC. 12 { Orchids, at Protheroe & Morris' Rooms.

WEDNESDAY, DEC. 13 { Dutch Bulbs, at Protheroe & Morris' Rooms.

THURSDAY, DEC. 14 { Dutch Bulbs, at Protheroe & Morris' Rooms.
Consignment of Lilies, Plants from Belgium, Carnations, Greenhouse Plants, and Roses, at Protheroe & Morris' Rooms.

FRIDAY, DEC. 15 { Orchids, at Protheroe & Morris' Rooms.
Dutch Bulbs, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—40°·7.

WE have already alluded to the issue of successive parts of this monumental work, published by HOUGHTON, MIFFLIN & Co. of Boston and New York. With exemplary regularity, the volumes appear one after another, so that now the publication of the fifth volume gives us an opportunity once again of calling attention to one of the most remarkable works of the century. The orders treated of in this instalment, so far as the North American trees are concerned, are Hamamelidaceæ, Rhizophoraceæ, Combretaceæ, Myrtaceæ, Cactaceæ, Araliaceæ, Cornaceæ, Caprifoliaceæ, Rubiaceæ, Ericaceæ, Myrsinaceæ, and Sapotaceæ. These are dealt with in the same encyclopædic manner as the preceding orders.

Professor SARGENT's style is clear, accurate and free from hesitancy, as might be expected from one who knows his subject so thoroughly well. His extended travel, not only in every part of his own country, but also in Japan, and his familiarity with the trees in cultivation in the Arnold Arboretum which he directs, and in the principal gardens of Europe, enable him to

take broad views as to the identity of species and their geographical distribution. Acting probably on the conviction that some modifications of the neo-American, or Otto Kunzean methods of nomenclature will, in spite of the warnings of ASA GRAY, be adopted by the coming race of American botanists, Professor SARGENT largely adopts that system.

Where it is possible to start afresh, it is no doubt better to act remorselessly on principles, but when we have to deal with a literature already vast in amount, and extending over nearly a century and a half, it is late in the day to set up a new standard.

The elaborate synonymy set forth by Professor SARGENT, and the addition of the principal dates for the publications quoted, however, go far to remove any inconvenience that European botanists might here and there experience.

The plan of the work is to give an exhaustive account of the genera, and species of North American trees (excluding shrubs), together with copious references to botanical literature and incidental notes on the history and properties of the several trees in which even the general reader will find much to interest him. As illustrations, we may mention an excellent summary of the history, properties, and mode of cultivation of the Clove tree, and the numerous biographical sketches of deceased botanists. Each species, moreover, is figured in the most careful manner, so that the botanist gets what artists, who are not botanists, do not give him—an accurate portrayal of the tree so far as the limits of size permit, and correct structural details such as we have no right to expect from an artist.

The present volume may surprise some on first opening it by the number of tropical and semi-tropical species that it includes, such as the Mangrove, the Terminalia, several Eugénias, under which latter heading the article on the Clove above alluded to occurs; Mimusops, &c. This is accounted for by the circumstance, very likely to be overlooked, that Florida gives a home to many outlying species whose head-quarters are in the West Indian Islands. In Florida they reach their most northerly limits of distribution, and so comes about the seeming anomaly of tropical genera occurring in the United States. The inclusion of the genus *Cereus* among the trees of North America may also occasion surprise, as we do not usually associate trees and cactuses; but of course there is every reason to do so, as the *Cereus giganteus* forms a tree 50 to 60 feet in height, and which occurs abundantly in some parts of Arizona. As a further illustration of the encyclopædic nature of the book, we find a record that *Cereus giganteus* first flowered in Europe at Kew in July, 1891.

Under *Cornus florida* mention is made of THOMAS FAIRCHILD and his work. The circumstance that he was the first, of set purpose, to raise a hybrid plant (a *Dianthus*) is not mentioned, though it naturally gives FAIRCHILD a first-class position in the hierarchy of botanists. The American Cornels, by the way, though so beautiful, rarely flower with us; and the Californian *C. Nuttallii*, we are told, does no better in the Eastern States of the Union. *Pinckneya pubens*, again, is a tree with beautiful flowers, which we should be glad to see in cultivation again. It was introduced here so long ago as 1786, by JOHN FRASEN, but "it is rarely cultivated, and has never received from gardeners the attention which the beauty and peculiar structure of its flowers would justify."

Rhododendron is represented by a plate of

R. maximum, the only tree of the genus within the author's limitations; nevertheless, it affords the opportunity for the insertion of an excellent article on *Rhododendrons* in general.

By the way, the artificial character of the distinction between trees and shrubs receives curious illustration in the case of *Kalmia latifolia*, treated as a tree in this book, but which, when cultivated in this country, is always of shrubby habit.

Obviously, we might extend our notice to almost any length, and then not exhaust the points of interest the book presents to varied classes of readers.

We cannot say more of the present volume, whether as regards the work of the author, or that of the artists, than that it is on a level with the previous four.

Some of our readers may be glad to know that it has been added to the LINDLEY Library, where it may be consulted by horticulturists, and that, of course, it forms part of every great botanical library.

ROYAL HORTICULTURAL SOCIETY.—The last meeting for the year will take place in the Drill Hall James Street, Victoria Street, Westminster, on Tuesday, December 12. The Fruit, Floral, and Orchid Committees will assemble at 12 o'clock, and new Fellows will be elected at 3 o'clock. The Scientific Committee will meet at 4 P.M.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—We are requested by Mr. G. J. INGRAM, Secretary, to inform those of our readers who are interested in the above, that the sum of £2 11s. has been received from Mr. BAILEY WADDS, gardener, Birdeall, Yorks; and the sum of thirty guineas from the Reigate and District Chrysanthemum Society.

AGRICULTURAL AND HORTICULTURAL EDUCATION.—It is now well to the front as a subject in a large number of rural districts. At Horncastle it has been ordered that agricultural chemistry shall be taught in the classes, held at the local science and art rooms. In the neighbouring county of Norfolk, Mr. MOREHOUSE has, on the same subject, been delivering a course of lectures (with experiments), to the villagers of Clay. Attendances have been good, and interest, especially in experiments, of an encouraging character. At Winslow, in Buckinghamshire, the young idea is not taking so kindly as it might do to the class for teaching the elements of gardening, for while in classes associated with other subjects there are as many as fifty-five students, those attending the gardening class have not yet totalled ten. The lecture which was to have been delivered at Saffron Walden, on the 20th ult., on the subject of horticulture, was unavoidably postponed, and that because owing to the accumulation of snow-drifts and other impediments thrown across the highways by the storm, the lecturer was unable to undertake the journey to the town. As the lecture is, however, one of a series, it will not be lost. At Hertford, on the 20th ult., the MAYOR showed his interest in horticulture by attending a meeting of the local horticultural society, at which an instructive paper on "Mannres" was read by Mr. WALLIS, jr. to Mr. H. SHEPHEAD CROSS, M.P. After the paper had been read, prizes were awarded to the best samples of Apples exhibited in the hall, where Mr. WALLIS had earned the thanks of his brother members of the society and their friends.

GARDENING INSTRUCTION.—The County Council of Worcestershire, recognising the great value of the work carried on by Mr. UDAL, have this year raised the grant to the Union to the sum of £150, it being understood that a second Instructor be appointed, and the scheme extended to the whole of the county. Accepting this responsibility, the Gardening Instruction Committee of the Council, out of many applicants, selected Mr. QUINTIN READ as assistant instructor. Mr. READ entered upon his duties on 11th of September, and his work promises

VIEW IN THE CONSERVATORY AT THE BOTANIC GARDENS, BIRMINGHAM.

to give much satisfaction. The following is a summary of the work done in the year ending September 30, 1893:—

No. of Visits paid to—	
Field allotments	284
Cottage gardens	252
Amateurs' gardens	158
Gentlemen's gardens	41
Market gardens, orchards, and farms ...	78
Lectures and conversational meetings ...	60

These lectures have been illustrated by admirable diagrams prepared by Mr. UDALE, and two practical demonstrations have been given on the pruning of fruit trees. The visits have been to seventy-five fields, representing about 2000 allotments. The range of lecture-subjects has included the following:—root crops, Potatoes, soils and manures, seeds and plant growth, green crops, small fruit culture, large fruit culture, insect pests, window plants and hardy flowers, work for the month, &c. Mr. UDALE reports that distinct progress is visible in regard to the more general and judicious use of lime in dressing fruit trees, preparation of soil, improvement of crops (Potatoes especially), and cleanliness of ground. He recommends the good policy of keeping the boundary hedges free from weeds, and a periodical "brushing down" of Nettles, Thistles, and other native plants, in good time to prevent their seeding; also of making arrangements, as far as possible, to keep the vacant allotments cleaned, in order to prevent fouling of the adjacent land. The council must record their opinion that a great measure of the success of the scheme is due to Mr. UDALE himself, who by his tact, ability, and energy has rendered the movement so popular. It is not easy, says the report of the council, in so short a time, to remove the many prejudices in favour of ancient methods that modern needs have rendered obsolete. In many instances the kindly reception of the instructor has been of benefit to him in showing the capabilities of this fruitful county, and in giving him opportunities of observing intelligent systems of cultivation, which he was enabled to encourage in general practice. The full benefit of the instruction cannot be realized until time has elapsed, but the progress already made is a source of great gratification to the council.

THE WEATHER IN THE RIVIERA.—A correspondent writes to us from La Mortola, on November 29, saying that the weather still remained very mild, the temperature ranging from 40° to 45° minimum, to 58° to 61° maximum. Vegetation in the garden is luxuriant; almost all the species of *Oreopanax* are in flower; also *Maka saligna*, *H. eucalyptoides*, *H. pugioniformis*, *Eucalyptus tereticornis*, *E. Lehmanni*, *E. crebra*, *Templetonia glauca* and *retusa*, *Russelia juncea*, many species of *Daphne*, thirty or thirty-five species of *Salvia*, *Echidnopsis cereiformis*, *Euphorbia splendens*, *Pelargonium*, *Geranium*, *Bignonia*, *Tecoma*, a quantity of *Solanums*, amongst others, *S. betaceum*, *laciniatum*, *ciliatum*, *Cervantesi*, *tomentosum*, *pseudo-capsicum*, &c.; *Hebeclinium*, *Cineraria amelloides*, *plataniifolia* and *populifolia*, *Helichrysum bracteatum*, many *Senecios*, and a great many other plants, are all in full bloom.

A GARDENER'S DUTIES.—Mr. PENLEY, the well-known actor, is fond of gardening. He also keeps cows; but, when on his behalf, Mrs. PENLEY asked a gardener whom he (Mr. PENLEY) engaged to look after the cows, he (the gardener) declined, and was dismissed. Mr. PENLEY, however, had not heard the last of the matter, nor did he until in the Godalming County Court. However, the Judge held that it was no part of a gardener's duties to attend to cows, and awarded a month's wages to the claimant.

THE GREAT GALE which raged on the 18th and 19th ult. did enormous damage in some of the Scotch forests, and in the South also much injury was occasioned. At Cheshunt it blew down a large tree, which, falling on the conservatory of valuable plants owned by Col. HAYWOOD, practically destroyed the whole of them. At Wivelscombe, in Somersetshire, as elsewhere, it rooted up a number of Apple trees. At

North Curry, in the same county, it blew down two noble Elms. At the little village of North Aston, in Oxfordshire, the collapse of a tree was unfortunately associated with the death of a little girl who happened to be passing it at the time; and notably in Cambridgeshire, it made the return from the markets a journey which will be more memorable than it was pleasant for the farmers and market gardeners.

BOTANIC GARDEN FOR CARDIFF.—At a recent meeting of the Parks Committee of the Cardiff County Council a resolution was passed to the effect that £500 be voted for the purpose of erecting a glass-house, and for buying a collection of herbaceous plants. This is intended to be the nucleus of a botanic garden, to be formed in connection with the Roath Public Park, now being made under the superintendence of Mr. W. W. PETTIGREW, the Council's head gardener, and which will be opened early in the spring.

PHENOMENAL FRUITS and vegetables have not failed to put in an appearance even during November. At the recent Chrysanthemum show at Cambridge, Mr. REEVE, of Mill Road, Huntingdon, exhibited Apples which were part of a third crop borne by one of his trees during the past season; and at Coggeshall, Mr. HORCHIN, of the Gas Works, recently gathered a second crop of Apples from one of his trees, which are described as being nearly equal in appearance and size to the first crop. At Horncastle, Mr. ATKINSON, of the Railway Inn, dug up a root of Potatoes, consisting of no fewer than eighty-two tubers, fifty-four of them being suitable for table use, and the total weight of the root being 21 lb. It (the root) was of the new variety known as the Woodhall Wonder.

CHRYSANTHEMUM SHOWS are now all but over for the season. In nearly all directions they have on the average more than held their own when compared with those of last year. One of the best attended was that at Norwich, where the spectators numbered over 8000, and the takings for admission came to £190. At Wokingham the pleasures of the show were not confined to people who paid for admission; the committee with exemplary kindness invited the inmates of the local workhouse and almshouses. At Ely, comparatively inaccessible though it is, the blooms and plants were by no means of wholly local growth; among the exhibitors were one or two of the most persevering metropolitan growers. At Beccles, where the judges were Mr. FISHER, gardener to Sir HUGH ADAMS, and Mr. JONES, gardener to Mr. J. J. COLMAN, M.P., the show in the opinion of those competent gentlemen marked a distinct advance on that of last year.

MUSHROOMS have been under the consideration of the members of the Taunton Farmers' Club. They (the farmers) have possibly learned how keen is the demand for Mushrooms in large centres of population. Certain it is that they attach so much value to the palatable fungi that they have unanimously passed a resolution condemning the old-time practice of allowing Mushrooms to become the property of those "early birds" who in the Taunton as in other districts have been wont to rise with the lark, and to gather Mushrooms wherever found. This, say the Taunton farmers, is a state of things which cannot be allowed to continue. Mushrooms are in future to be regarded not as the property of enterprising early risers, but as belonging to the occupiers of the land on which they grow. Any persons who may set their face against the resolution arrived at by the Somersetshire yeomen, and seek to gather Mushrooms in the old-time manner, are to be prosecuted.

HORTICULTURAL MEETING AT GHENT, ON DECEMBER 3.—The thermometer on the night of December 2–3 fell to 6° C., below zero 21° F., thus preventing many nurserymen and amateurs from sending exhibits to the meeting. M. JULES HYE, however, was very successful with his fine hybrid, *Cypripedium fastuosum* (*Spicerianum* × *hirsutissimum*), which gained for him a Certificate of

Merit *par acclamation*. The upper sepal of the new Orchid resembles that of *Spicerianum* in form, the green base is spotted all over with blackish purple, the purplish rose-ground has a violet sheen over it, spotted over half its height, and with a broad, dull-white border; the mid-rib broad and unusually dark; the petals like those of *hirsutissimum*, three-fourths green and much spotted; the tip is the tint of that of *hirsutissimum*, surrounded with a clear green band, hairy at the base, the lower sepal pale green, the lip dark, glossy, well-veined; staminode yellowish-green, surrounded with glossy purple, the tip ivory white. M. JULES HYE also gained a Certificate of Merit for *Laela Goudiana*, a beautiful dark variety. M. WALLEM obtained a Certificate of Merit for a *Dracæna Sanderiana*, which he accompanied with the following note:—"From a commercial point of view this *Dracæna* is one of the best plants introduced during the last few years. We have had ocular demonstration that the plant staged by SANDER & Co. at the Quinquennial Exposition was afterwards shown for some days at the World's Fair at Chicago, whence it was returned to London, not appreciably injured.

HORTICULTURE AT THE ANTWERP EXPOSITION UNIVERSELLE.—There will be held during the World's Fair at Antwerp a permanent exhibition of ornamental trees and shrubs, Roses, perennials, Rhododendrons, Azaleas, fruit trees, &c. This exhibition will be in the grounds of the Exposition Universelle. The temporary shows will number four, as follows: 1st. From May 11 to 16, a general exhibition of horticultural products, fruit, and vegetables grown under glass. 2nd. At the end of June, an exhibition of cut Roses and other flowers, floral decorations of all kinds, plants for rooms, flowering plants of the season, and fruits grown under glass. 3rd. At the end of September, a fruit show, plants grown for export and market, cut flowers, &c. 4th. At the conclusion of the general exhibition, a Chrysanthemum show.

COMPLIMENTARY DINNER TO MR. GEORGE CANNON.—A committee has been formed at Ealing for the purpose of carrying out a complimentary dinner to Mr. GEORGE CANNON, on the occasion of his leaving the service of Messrs. CHARLES LEE & SONS, to go into business on his own account. The dinner is to take place in the Lyric Hall, Ealing, on the 15th inst., and at the request of the committee the chairman will be Mr. RICHARD DEAN.

RETIREMENT OF M. L. GILLEKENS.—For twenty-six years M. L. GILLEKENS has been Director of the Ecole d'Horticulture of Vilvorde, and he has now tendered his resignation. The Royal warrant, while accepting the resignation, authorises M. GILLEKENS to retain his present title as an honorary distinction.

"BOTANICAL GEOGRAPHY."—M. GEORGES POIRAU is publishing in parts a French edition of Professor DRUDE's well-known work under the title of *Manuel de Géographie Botanique*. To many it may be convenient to have this standard book in French rather than in German, particularly as the translation has been revised and added to by the author himself. M. PAUL KUNISIECK, 52, Rue des Ecoles, Paris, is the publisher.

"DICTIONNAIRE PRATIQUE DE L'HORTICULTURE."—The French edition of NICHOLSON'S *Dictionary*, prepared by M. MOTTET, and published by M. OCTAVE DOIN, Place de l'Odéon, Paris, has entered upon its second volume. Three parts are before us, parts 17, 18, and 19, which bring the work up to the article Dahlia. The numerous additions, both to the text and to the illustrations, render this French edition very serviceable, even to those who possess the original.

"THE FLORA OF KENT."—Mr. A. D. WEBSTER has published under this title a list of plants observed by himself, chiefly near Bromley, and near Deal and Dover. The list does not aim at completeness, and we fear the critical botanist will

hardly look on it with favour. What can the author mean by *Cornus suecica*, which, he says, is found near the lighthouse, Dover?—and which lighthouse? In some cases the information is superfluous. It was surely not necessary to cite specific localities for the Shepherd's Purse. *Tamarix gallica* was planted in the localities mentioned by the late Mr. Masters, of Canterbury. The Kentish flora is so varied and so interesting, that we earnestly hope we may not have to wait much longer for the promised volume which will contain an authoritative record.

THE BALATA INDUSTRY AT PARAMARIBO.—

Under the name of balata, a substance similar in many respects to gutta-percha, but furnished by *Mimusops globosa*, has been from time to time brought to notice in this country in the course of the last thirty-four years, for it was in 1859 that it made its first appearance in London. In 1862, however, during the International Exhibition, some samples of the raw product were shown from British Guiana, and attempts were made to utilise it either as a substitute for, or in combination with, gutta-percha. The result was that a demand sprang up for it, and some 20,000 lb. were imported in 1865. During the next ten years the demand continued to decrease, reviving again in 1877, and after that fluctuating considerably till about three years ago, when but a very small quantity found its way to the British market. The advantages claimed at first for balata was its greater ductility and tenacity than gutta-percha. But time has proved that, like gutta-percha, balata becomes brittle and cracks when exposed to the air, and that it has no advantages over the longer-known substance. As an illustration of the continued fluctuation of this product, we quote the following extract from a Report by the British Consul on the Trade and Commerce of Paramaribo for 1892:—"Although," says the Consul, "the balata exploitation has made a steady progress, the general results are not favourable, owing to the price of the article having gone down remarkably in the course of the year. Unless an improvement in the price of the article takes place, very little will be done during the next year in the exportation of it, which will be a terrible blow to the district in general. It is expected that an ordinance will soon come into force regulating this industry, and by which ordinance it shall be enacted that the grant-holder has to pay yearly a certain sum per acre of land."

"BIRDS OF MICHIGAN."—The ninety-fourth *Bulletin* of the Michigan Agricultural College is by Mr. A. J. Cook, and bears the title of the *Birds of Michigan*. This publication is not merely well and clearly printed, but generously interspersed with charming little pictures of the birds described, while the style of the writing is both concise and interesting. The pamphlet is no mere list of names, but gives distinguishing descriptions, and a short account of each species, to which are added a bibliography of bird-lore, and a full index.

FOREST TREE PLANTATION.—The University of Illinois publishes, from the Agricultural Experiment Station, a bulletin on Forest Tree Plantation, which should be valuable to all interested in the formation and preservation of plantations of timber trees. Such a publication is especially called for now, when the rapid destruction of the forests is in many places causing great anxiety for the future supply of timber, and any schemes for multiplying suitable species of trees are peculiarly welcome.

FRUIT-GROWING IN CALIFORNIA.—One of our correspondents sends us copies of San Francisco papers of October 14 and 21, containing market reports, in order to show the enormous extent to which fruit-growing is now carried on in that State. Hops also are now largely exported to this country. Forty-five car-loads were sent off from Santa Rosa on a single day to London. From Santa Clara it is estimated that 1600 car-loads of Prunes will be sent off eastward, as well as 125 car-loads of dried Apricots, and 150 car-loads of dried

Peaches, a car-load averaging 15 tons; this means 24,000 tons of Prunes, 2250 tons of dried Peaches, and 1875 tons dried Apricots. The canned goods from this State (Los Angeles and the South not being reported) were as follows, in tons:—

From—	Dried Fruit.	Canned Goods.	Green Fruit.	Raisins.
San Francisco	348	2433	...	12
Sacramento	772	397	9787	...
San José	3079	870	2743	...
Marysville	1092	488	1099	...
Stockton	1423	47	2887	405
Oakland	138	224	937	...
Totals	6843	4459	17,453	417
January	589	1880	...	1757
February	1171	1800	...	1406
March	614	999	...	828
April	218	807	...	321
May	248	1113	370	117
June	134	989	5103	94
July	477	1657	12,827	94
August	1307	2143	29,789	28
Nine months	11,456	15,247	56,542	5971

The shipments from the same terminals during the first nine months of 1892 were 22,180 tons canned goods, 14,335 tons dried fruit, 3918 tons raisins, and 40,152 tons green fruit. We forbear to quote more figures though we have been provided with many more. The statements, astonishing as they seem, are borne out by other evidence; thus from New York, we learn, that nearly 900 tons of fresh Californian fruit were sold by auction during the season. It will be seen that the Californian growers have three strings to their bow: 1, fresh fruit; 2, canned fruit; and 3, dried fruit; and if there is a loss on one, there is pretty sure to be a gain on the other two.

CHRYSANTHEMUMS.—The *American Florist* gives a series of illustrations showing one manner in which our American cousins exhibit Chrysanthemums. As it is a great improvement on anything we do, we may add that it merely consists of placing a definite number—twelve to fifty blooms of each variety—in an ornamental vase. This allows of ready examination and comparison, and is far better than our board system. In the matter of single-stem specimens, the Americans are no further advanced than ourselves. We may add, that this paragraph was written prior to the show at the Aquarium this week, and at which the American plan has been partially adopted with great advantage.

FUCHSIAS.—Mr. CANNELL obligingly sends us two "sports" from Champion of the World, a variety with deep blue petals and red sepals. One sport has very double flowers, with red sepals and lilac petals. The other is a single flower, with red sepals and four pure white petals, traversed by pink nerves. This latter flower seems as if it were a reversion to a previous simpler form.

HORTICULTURAL COLLEGE, SWANLEY.—The Experiments Committee of the Kent County Council held a meeting at the above on Thursday, November 30. Mr. WING proposed that the secretary prepare a report of the working of the committee, and the experiments undertaken during the past year, to be submitted to the committee at the next meeting, after which it should be sent on to the Technical Education Committee. Mr. PENTLAND SMITH, M.A., B.Sc., offered to give an account of Potato Disease at the next meeting, Thursday, December 14.

COUNTY COUNCIL HORTICULTURE IN SURREY.—An interesting feature in connection with the horticultural instruction now being given in Surrey under the auspices of the County Council, is the appointment of Mr. JAMES DOUGLAS, a member of the Council of the Royal Horticultural Society, as travelling inspector of the classes. His duty seems confined to asking a few questions of the members of the class at the close of the lecture, and of

reporting as to the general interest and intelligence shown by those present. The duty is no light one, as no fewer than 240 lectures are being given during the winter, in courses of six each, at 40 diverse centres, many of them in remote parts of the county, necessitating very late hours. The lecturers are Mr. J. WRIGHT of the *Journal of Horticulture*, Mr. A. DEAN, Kingston-on-Thames, and Mr. G. GORDON of the *Gardeners' Magazine*. Ten lectures per week are divided between them, the lion's share being taken by the two first-named. The courses started on Mondays, September 25 and October 2, and will for the present year conclude on December 15 and 22. The course opened with lectures on flowers and fruit, and change to vegetables as the winter advances. Vegetables are perhaps the more interesting subjects, but flowers succeed in attracting many females. However, so far as the tender sex is concerned, there is no rule. In some places they attend any course in numbers, in others they do not put in appearance. The most rural districts generally give the best attendances. How far the appointment of Mr. DOUGLAS as mentioned may prove beneficial remains to be seen, but there seems to be evidence that in some other counties some inspection of the classes in horticulture is much more needed. So far as relates to Surrey, there is no danger of friction between the inspector and lecturers. All work amicably, and it is very probable that Mr. DOUGLAS's reports may help to strengthen the County Council in their horticultural instruction.

LETTERS OF ASA GRAY.—We are pleased to record the publication, in two volumes, of the letters of the beloved American botanist. Only those who knew him, or were in correspondence with him, can fully estimate the fascination and charm which ASA GRAY exercised over his associates. We shall take an early opportunity of making our readers acquainted with the contents of these two volumes, which are issued under the editorship of Mrs. GRAY, and published by Messrs. MACMILLAN & Co.

NATIONAL CHRYSANTHEMUM SOCIETY.—The annual dinner took place at Anderson's Hotel, Fleet Street, on the 30th inst., about 140 persons being present; the President, Sir EDWIN SAUNDERS, was in the chair, supported by D. LOW, F.L.S., Professor AGUILAR, and Messrs. E. TRIMMER, J. G. MACKINLAY, S. HUTCHINSON, A. GIBBINGS, W. F. FORSYTH, C. E. SHEA, Dr. GEORGE WALKER, &c. At the back of the chair was a very effective and finished arrangement in plants furnished by Messrs. E. D. SHUTTLEWORTH & Co., Albert Nurseries, Peckham Rye, some noble Palms here and in other parts of the room being a very fine feature. The tables were profusely decorated with Chrysanthemums, and an excellent dessert was furnished by members of the Society. The proceedings were carried out with great spirit, and in the course of the evening the National Challenge Trophy, the Holmes Memorial Challenge Cups, Major COLLIS-BROWNE'S Silver Cup, and the various medals, were presented to the winners. In proposing success to the National Chrysanthemum, the Chairman bore testimony to the fine character of the exhibitions which had been held, to the remarkable growth in the membership—150 new members having joined in the present year, and to the number of colonial societies which had become affiliated, inclusive of one at Cape Colony. It was announced that the reserve fund amounted to over £50. The musical arrangements were excellent, and the evening's engagements appeared to give the greatest satisfaction to the large company present.

LONDON PARKS.—Mr. W. BAILEY, superintendent of the Southwark Park, has been appointed as superintendent of the park at Dulwich. Advantage has been taken of this event by the employers at Southwark, who have presented Mr. BAILEY with a cruet-stand as a mark of their esteem.

BRITISH HEPATICÆ.—We have to announce the publication of a handbook of British Hepaticæ by Dr. M. C. COOKE. Messrs. W. H. ALLEN & Co. of Waterloo Place are the publishers. We shall allude to the volume on another occasion.

"THE ORCHID BOOK."—Under the title "*Le Livre des Orchidées*," Count OSWALD DE KERCHOVE DE DENTERGHEM, the well-known and highly-valued President of the Royal Agricultural and Botanical Society of Ghent, is about to publish a work on Orchids, which will form a companion volume to that on Palms which has achieved such a success. We await its publication with eager interest, and advise those of our readers interested in the subject to bear in mind the address of the publisher, M. AD. HOSSE, 47, Rue des Champs, Ghent.

CONSUL F. C. LEHMANN'S HERBARIUM.—The statement that the fine herbarium, formed during the last twelve years by Consul F. C. LEHMANN, chiefly in Colombia and Ecuador, is to find a home in the Botanical Department of the Natural History Section of the British Museum, will be, we are sure, pleasant news to British botanists and horticulturists. The specimens were collected at all altitudes, from the sea-level to the highest paramos, or regions of perpetual snow, and embrace a great variety of new and extremely rare species. Carefully-coloured sketches and notes taken on the spot where the plants were found enhance the value of the carefully-dried and arranged specimens. Mr. LEHMANN has done a great and lasting work for botanists in the regions he has explored, and the many new *Masdevallias* he has discovered will come as a revelation to those who thought all the beauty of the genus had been worked out. Unfortunately, his earlier work, like that of many other diligent men, is for the time buried in the Reichenbachian herbarium.

RETIREMENT OF ED. ORTIGES.—We are authorised to announce that M. ED. ORTIGES, who for the last thirty-eight years has so ably filled the post of Curator at the Botanic Gardens, Zurich, is about to retire into private life, and will yield up his office on April 1, 1894, a time when he will be within a month or so of the jubilee of his service in the horticultural world. From 1848 for some years Mr. ORTIGES served as a young gardener at Chatsworth and in some of the London nurseries, at which time he made a large circle of English friends, which his business relations and frequent visits to this country steadily widened. At home he was noted for the cleverness with which he managed the gardens, and for his urbanity towards visitors—especially those who came from the British Isles. On the Continent M. ORTIGES won many honours, and his connection with British horticulture is kept fresh by his being a foreign member of the Royal Horticultural Society. May he long enjoy the rest he has so well earned.

ISLINGTON CATTLE SHOW.—The annual show of the Smithfield Club in the Royal Agricultural Hall, Islington, was opened on Monday last, and extended over the four following days. As is usual upon this occasion there were great displays of agricultural produce by the leading seedsmen, and an even greater display by the sundriesmen of feeding-stuffs, insecticides, implements, &c. Noticeable among the seedsmen and nurserymen were the following, Messrs. E. B. WENN & Co., Stourbridge, SUTTON & SONS, Reading, CARTER & Co., High Holborn, HARRISON & SONS, Leicester, all of which firms were well represented by large stands of Swedes, Mangels, Turnips, Potatos, and grains. Messrs. J. CHEAL & SONS, Crawley, GAYMER & SON, Norwich (cider and Apples), and Messrs. DICKSON & Co., Chester, exhibited Apples; Potatos were from Mr. C. FIDLER, Reading, and from Mr. A. FINDLAY, Markinch, N.B. Seeds also came from Messrs. JARMAN & Co., Chard, Somerset, from Mr. H. KING, Coggeshall, Essex, and from Mr. WALTER PARSONS, Reading.

THE BOTANICAL GARDENS AT BIRMINGHAM.

[SEE SUPPLEMENTARY ILLUSTRATION.]

SITUATED in the pleasant suburb of Edgbaston, this garden is of the utmost importance as a botanical centre for the largest and most prosperous of midland towns. It is a well-planned and picturesque garden in a pretty bit of country, dotted with handsome villa residences, and surrounded by well-preserved trees. These gardens were originally designed by the celebrated John Claudius Loudon, sometime in or about the year 1831, the land having been acquired in 1829, and I believe I am right in saying that David Cameron was its earliest curator. Cameron was in many ways an ideal curator, and a friend both of Knowles and Westcott, and also of the late Dr. T. T. Mackay, and

FIG. III.—CEROCARPUS PARVIFOLIUS. VERY RED, ON A YELLOW-GROUND COLOUR. (SEE P. 715.)

the Edinburgh McNabs, with whom he kept up extensive exchanges and correspondence, and his name constantly recurs in the best horto-botanical literature of his time, viz., in Knowles and Westcott's *Floral Cabinet*, in Maund's *Botanist*, and also in the *Botanic Garden*, as well as in several other periodicals; while his writings, short, clear, and logical as they are, show him to have been deeply interested in the garden flora of his day.

Cameron was succeeded by Mr. Cattin, and then the charge was given Mr. W. B. Latham, out of many competitors, and in his hands the best interests of the Birmingham Botanical Gardens have prospered for a quarter of a century.

Concerning the laying-out of this garden by London, we have the following account in the preface to his posthumous work, entitled *Self-instruction for Young Gardeners*, p. xxxvi.

"In the beginning of the year 1831 (a short time after his marriage, and after the publication of the *Encyclopedia of Gardening*), he had an application to lay out a botanical garden at Birmingham, and he agreed to do it, merely on the payment of his expenses. On this occasion I (his wife) accompanied him; and after spending about six weeks in Birmingham (which, though it is my native town, I had not seen for years), we made a tour through the North of England, visiting the lakes in Cumberland and Westmoreland."

Soon after the establishment of the garden, i.e., from 1836 to 1840, Messrs. Knowles and Westcott

began a publication called *The Birmingham Botanic Garden, or Milland Floral Magazine*, "containing accurate delineations, with botanical and popular descriptions of plants;" and this was succeeded by *The Floral Cabinet and Magazine of Exotic Botany*, of which three volumes were published, illustrated with nearly 200 coloured plates and some wood engravings. In these two works there are to be found figures and descriptions of the many rare and interesting plants at that time cultivated in the gardens, and some of which are grown there to this day. A singular instance may be given. Thus, Knowles and Westcott illustrate what they call *Oncidium intermedium*, a species resembling, and apt to be confounded with *O. luridum*, from which, however, it differs in several important characters. Of this plant, Messrs. Veitch & Sons, in their *Manual of Orchidaceous Plants*, part viii, p. 58, speak as follows:—"The variety *intermedium* is the handsomest of all the *O. luridum* forms we have seen; it was first sent from Cuba in 1837 by a Spanish merchant of Havana, to Mr. George Barker, of Birmingham, but was subsequently lost; it has recently reappeared in cultivation, and is now in the collection of Baron Schroder, at The Dell." The above extract is substantially correct, if we except the statement of its ever having been lost, since Mr. Latham informs me that the plant has always existed in the Birmingham Botanic Garden, and is growing there still. *Symphoricarpus microphyllus* (syn. *S. montanus*), a very desirable shrub not often found in collections, is here to be found, the drawing in Maund's *The Botanist* is from this plant. *Leptophyllum buxifolium*, a pretty small-growing shrub, the plants of these here are very old, and there is little doubt have been here since the foundation of these gardens. *Galax aphylla*, this plant has been well established here for many years. I shall send Mr. Latham *Shortia*, which ought to do as well, since both *Galax* and *Shortia* have the same habitat in North America, and are not easy to distinguish as seen growing together. *Clethra densifolia*, *Zenobia speciosa*, *Buddleia globosa*, a plant seldom seen in this cold-winter neighbourhood, has proved quite hardy here, having withstood the frost for the last ten years. *Chamaerops excelsa*, a fine plant, 35 feet high in conservatory, with a splendid head. *Camellia reticulata*, a large specimen of this showy species, and one of the largest plants in the frame-yard at Chiswick is, alas, no more. *Brahea filamentosa*, good plants, and in rude health. *Gardenia Stanleyana*, with its long-tubed flowers; *Odotadenia speciosa* (syn. *Dipladenia Harrisoni*), a beautiful stove climber. *Jatropha urens*, an Urticaceous plant for which Mr. Latham has great deference, as it once stung him very severely when at Kew. *Pritchardia grandis*, *Stevensonia grandifolia*, *Aristolochia gigas* var. *Sturtevantii*; *Musa ensata* has been flowering very freely. *Doryanthes Palmeri*, *Staurospis lisochiloides* (syn. *Vanda Batemannii*), *Vanda Sanderiana*, *Archonthe Cathartii*, *Artocarpus incisa*, "the Breadfruit Tree," and *Ficus indica* also do well in this garden. The garden itself consists of about 12 acres, of gently undulating ground, and contains a good collection of hardy trees and shrubs. The curator's residence is flanked, indeed one might say surrounded by the well-filled plant houses and in front is a broad terrace-walk or promenade fringed by borders of hardy plants. Below the terrace is an expansive amphitheatre of velvety turf, varied here and there by well-grouped trees. I spent a lovely fresh spring day in the place late in April last, when the trees had donned their freshest verdure, and was especially struck by the bold and picturesque beauty of the tree masses as they loomed up in the mist of early morning. The thrushes and blackbirds were all in fullest and sweetest song. The nightingales used formerly to visit and enliven this paradise hortulan with their song; but they are said to have resented the introduction of musical promenades and bandmasters, and so fled to pastures new. An enormous Cherry tree at the extremity of the old archery meadow was like a wedding

bonquet or a great silver fountain, so thickly were its pendent branches clustered with showy blossoms. There is here also perhaps one of the finest groups of trees and shrubs belonging to the genus *Magnolia* existent in any British botanical garden. *M. acuminata* is especially noticeable as a tall tree, and *M. conspicua*, *M. soulangeana*, and other forms of *M. Yulan* had their upturned branchlets tipped by exquisite vase-shaped flowers or glistening buds. Another rare old species with large and very fragrant flowers I was especially glad to see luxuriant and floriferous. This was *M. auriculata* of the *Botanical Magazine*, t. 1206, better known, perhaps, as *M. Fraseri* in gardens. It forms at Edgbaston a large spreading bush, 10 or 12 feet in height, or more, and as much in diameter, and as one stands at ten yards distance the erect buds and blossoms can with difficulty only be distinguished from the tender young foliage, the backs of the sepals and petals being of an Apple-green hue. When you have flowers and buds gathered, however, the delicate beauty of its noble flowers at once becomes apparent, the green segments being of a rich cream colour inside, and the green of the young foliage is then contrasted with the red brown stipules or auricles, that are such a distinct feature in this species. Although introduced from North America over a century ago, it is still anything but a common species in our gardens.

One great feature in London's practice as a landscape gardener, was the care he took to preserve any existing trees, and there are striking instances of his subtlety in this direction at Birmingham. At one corner of the garden there still exists, healthy and vigorous, and umbrageous, one at least of the far-famed Oak trees of Shakespeare's own fair county of Warwick. It is a pendent-branched form of *Quercus robur*, and has a splendid mile post-like bole or trunk fully 4 feet 6 inches in diameter. Quite near to this giant of the forest there is a Chinese *Wistaria* covering a run of 60 feet or more of a brick-wall, from which its "purple Laburnum" like flowers dangled in richest profusion. On the face of this wall, struggling for food and space above the *Wistaria*, are two quaint little Scots Fir trees, that have naturally sprung up there from chance or bird-sown seeds.

The Scots Fir trees on the old brick wall have been established there many years. An old gardener who has worked here forty-five years, told me that they were there when he came, and a good size then, but during the last twenty-five years they have made but little growth, although they are still in a healthy condition. Any one reading this little history and looking on these little Fir trees, may at once grasp the whole secret of the Japanese tree-dwarfing maia, viz., root-restriction, or want of full nutrition; indeed, their little gnarled and contorted trunks and branches remind one of the artificially-dwarfed little Conifers which for ages have been so popular in Japan.

The plant-houses, old and new, are mostly connected with an ample corridor in front, and are most conveniently adjacent (or otherwise) to the residence of the Curator, and the reading and waiting-rooms of the subscribers and their friends, the revenue of the gardens being mainly derived from subscriptions, and from the floral exhibitions, &c., held periodically in the beautiful grounds.

The spacious corridors before alluded to, besides affording space for the smaller and more select shows, also lend themselves to luxuriant adornment by creeping and climbing plants overhead; and *Lapagerias*, both red and white, are here to be seen splendidly flowered during their wonted season. At the time of my visit, some fine specimens of Schertzer's *Anthurium* were gay with enormous red spathe, and one end of a stove or Fern-house was most attractive, as furnished by some very handsome plants of the great *Platyserium stemmaria*, which, as here grown, absolutely rivals *P. grande* in its magnificently bold drooping fronds. Never since I used to gaze admiringly at the enormous Stag-

horn Ferns clustering high up on the trees overhanging the rivers in Borneo and in Jahore, have I seen such noble plants of these *Platyseria*. Another noble Fern, of which there is here a unique example, is *Dicksonia Lathamii*, a hybrid reared here in the gardens. The various kinds of *Hoya*, including the great *H. imperialis*, *H. globosa*, and *H. australis*, and several of the night-blooming species of scandant *Cereus*, grow overhead in the warmer greenhouses. I was also very pleased to see once again the dainty little tendril climbing Lily, *Gloriosa Plantii*, and the peculiar little *Ficus diversifolia*, with terra-cotta tinted fruits clustered amongst its quaint and leathery leaves.

A stage full of named *Auriculas* was a treat to see, and Mr. Latham informs me that they are fully appreciated by many, even if not most, of the visitors to the gardens. *Hydrangeas* in pots are especially well grown here, from hard shoots rooted in July; and one of the specialties of the warm greenhouses in autumn or winter is the *Verbenaceae Callicarpa purpurea*, with its long branches laden with glossy lilac berries in axillary clusters. *Pentapterygium rugosum*, a beautiful *Vaccinium* from northern India, was covered with its tiger-barred waxy bells here, and is a beautiful plant far too rarely seen.

Orchids are quite a special feature here, and there are many interesting species, both old and new. *Cattleyas* were showy, also *Cypripediums*, including Mr. Latham's beautiful hybrid, *C. Lathamianum* (= *C. Spicerianum* × *villosum*), *C. Lawrenceanum*, and many others. *Coelogyne cristata* is largely grown here, and in one little pit, mainly devoted to cool Orchids, I was glad to see a vigorous plant of the rare *Masdevallia pulvinata* in bloom, and as healthy as if high up on its native Andean range.

In conclusion, I should like to impress upon all visitors to the metropolis of Midland England, the desirability of their paying a visit to the Edgbaston garden, feeling assured that it will at all times and seasons repay them well to do so. Birmingham itself has a horticultural history of the best, and one which but few other towns in England can hope to rival. The Pitmaston *Nectarine*, and the Pitmaston *Duchess Pear*, were raised here by Mr. Williams, of Pitmaston; and so were two of our very finest winter-blooming Heaths, viz., *Erica hyemalis* and *E. Wilmoreana*, the first-named being now more largely cultivated than perhaps any other species of *Erica*. The Birmingham horticulturists are very proud of their traditions, and speak with pride of Barker, Wilmore (raiser of the *Ericas* alluded to above), Pope, Plant, London, Knowles, and Westcott; Cameron, Catlin, and many others who held aloft their well-lighted torches in past days.

At the time of my visit not only did I hear of the past, but I saw much of present import, and there were suggestions for the future; and I heard whispers, "not loud but deep," about a projected new house for aquatic plants, and for a new rock and alpine garden, both as additions to the already abundant attractions of the Edgbaston gardens.

The Hon. Secretary of the Botanical and Horticultural Society of Birmingham, to whom these fine gardens belong, is Professor W. Hillhouse, of Mason College, a devoted botanist and horticulturist, who together with Mr. Latham (who has acted most efficiently and courteously as Curator for the past twenty-five years) is determined to advance the best interests of the gardens and of gardening at the same time, and it was a great pleasure to me to see such mutual scientific enthusiasm and practical skill given ungrudgingly in such a good cause. There is at Birmingham a large and influential Gardeners' Mutual Improvement Society, and I feel sure that its members will ever keep up the *esprit de corps* and best traditions of the district, which are indeed well worthy of being collected and preserved in some permanent form—perhaps some member may prepare a paper for one of their very interesting meetings. So numerous and valuable are these traditions and facts, that one cannot but hope that ere long some sympathetic editor may be found to do them justice. F. W. Burbidge.

BOOK NOTICE.

- (1.) AN ELEMENTARY TEXT-BOOK OF AGRICULTURAL BOTANY. By M. C. Potter, M.A., F.L.S. (Methuen & Co.)
- (2.) ÉLÉMENTS DE BOTANIQUE AGRICOLE. By E. Schribaux et J. Nanot. (Paris: Baillière, Rue Hautefeuille, 19)

The first is one of a host of books which the recent extension of technical education has called into existence. It is a brief summary of the more salient features in the anatomy and life-history of plants condensed from well-known text-books, fortunately by one who has an acquaintance with the subject. The author is very conscientious in acknowledging the sources of his information, and of the numerous illustrations which are diffused throughout his volume.

The account of the grasses is mainly taken from Hayward's *Botanist's Pocket book*, a very useful book for its purpose, but not designed to teach agricultural students the peculiar features of grass-structure, which most concern them. Mr. Potter would do well to study these points for himself, with the aid of what has been previously written about them in accessible books and memoirs, and incorporate them in his next edition.

The joint production of MM. Schribaux and Nanot, and covers the same ground as that occupied in the preceding book. It is more complete, though, owing to the language in which it is written, not so suitable to the English-reading student. To those to whom the language offers no difficulty we commend it, as containing within small compass an excellent account of those portions of structural and physiological botany which most concern the agricultural and horticultural student.

The section on herborising excursions, and their utility in affording the means of acquiring a knowledge of agricultural botany, though short, is likely to be very serviceable. It leads naturally to the consideration of the larger subject of botanical geography, the economical aspects of which are also rendered obvious. An index and a full table of contents go to make up one of the best manuals of its kind that we have seen.

HOME CORRESPONDENCE.

SHANKING OF GRAPES.—The question raised recently in your leader, as to Grapes not shanking out-doors, goes off the beaten track, and suggests the best general explanation of the prevalence of shanking under glass in this country that has yet been offered. There are plenty of your readers who could tell you that shanking in its worst form often occurs in vinerias under Grape-growers of repute, where every condition of successful culture is supposed to be fulfilled. In such instances there is usually only one point in which the treatment differs radically from the open-air conditions, and that is temperature and ventilation. In some of the worst cases of shanking I have ever seen—going on year after year, and which some of my old neighbours who have read the *Gardeners' Chronicle* as long as I have will recall—the night temperatures were on the highest scale, and excessive. Here, where the vinerias were equipped to perfection regardless of expense, shanking was a nightmare to all concerned, for whole crops perished on strong young Vines, on heated, aerated, and drained borders alike, all on a dry gravelly subsoil, in light loam, and borders not exceeding 2 feet 9 inches in depth; and plenty of similar instances could be recorded. I have often wondered if shanking was at all troublesome in outdoor vineyards, because we never hear of the disease under such circumstances, and if it did exist, it would be a serious matter both as regards the crop and the quality of the wine produced. No doubt excessive cropping contributes to shanking under glass, but the same weight of crop out-doors does not seem to cause it. Here is a note made on the spot by myself some years back, on the Vines that produce the dessert Grapes on the walls at Thomery, south of Paris;—"Vines 16 to 18 inches asunder,

not very robust; two shoots generally from each spur, not far apart; at least one bunch to every shoot, and very often two; crops heavy." This is a fair sample of the practice there for a long period, where shanking is, I believe, practically unknown. I saw none, and the only troubles of the growers seems to be late frosts and occasional mildew. The sort generally grown is Royal Muscadine, but all the sorts were equally free from shanking. Now, this is an early Grape, and in our vineries in this country it is expected to ripen in between four or five months, and the Black Hamburg a little later. According to the late Robt. Thompson, the Thomery Grape-growers produce "as many as 320 bunches on a surface little more than 8 feet square." If you take this figure, or the three to four bunches from each spur on close-jointed and close-planted rods, I would like to hear where it has been matched anywhere in this country. The only difference between the vineyard growers and English growers under glass is one of time and night temperature. The Muscadine buds begin to swell in February, and the Grapes are never ripe till September and later; and as regards night temperature, sheets are required to exclude frost till the vines are well advanced—a sufficient commentary of the teachings of those who still stick out for an exhaustive temperature of from 65° to 75° for Vines coming into flower. I think if there be anything certain in Grape culture, it is that giving the Vines plenty of time from beginning to end, ample ventilation, and moderate or low temperatures at night are the surest means of securing well-finished Grapes. Shanking and bad colour are always associated, and seem to arise from the same cause. Colour spreads slowly over a bunch of Grapes, beginning, as a rule, near the foot-stalk, and gradually extending to the point of the bunch. Time is necessary for this process, and if it is not afforded, the point of the bunch of black Grapes remains red, and probably shanks, just as if the something needed to finish had not had time or power to reach the extremities. I think "shanking" a wrong name for the disease. Shrivelling of the foot-stalk of the berry is a symptom, but it does not account for what a few days before was a solid-fleshed berry, changing into a blob of sour water, in taste extremely nasty, and quite unlike sour Grapes when swelling. A decided and often sudden chemical change, quite destroying the tissue, takes place, and such as does not take place if you gradually destroy the foot-stalk by artificial means, in which case the berry shrivels only. Shanking always begins with the second swelling, and is always worst between then and maturity. A distinct check to the growth of wood-laterals is also always apparent at this stage, showing that the Vine's strength has begun to be seriously taxed; indeed, I doubt if the green berries, before the stoning period, have any exhausting effect on the Vines at all. They seem to perform a function similar to that of the leaves; identical but that is a question for the physiologists. J. S. W.

I read the article on p. 624 on the above subject, and agree with the writer in hoping that gardeners may be induced to leave the beaten track, sure I am of the opinion, that if borders were properly made, and watering well attended to, shanking would be a thing of the past. Some fifteen years ago I took charge of some vineries where the Grapes shanked every year, and one house of young Vines was as bad as the rest; but after I had replanted these Vines, shanking was not seen, nor would it occur if directions which I gave were followed up. An examination of these borders showed that they were 5 feet 9 inches deep at the front, and the soil contained plenty of bones and farmyard manure. What wonder that shanking occurred? the borders were like a bog—spongy; and for a man to have walked over them would have been an unpardonable offence. I had these great excavations filled to a depth of 3½ feet with solid material, leaving the depth of the border at the back or path, 2 feet; and at the front, 2½ feet; and a 3-inch drain-pipe laid in lines 4 feet apart. The materials are made firm by ramming, and over this a layer of concrete, 6 inches thick was laid, and then filled in between with half-bricks, everyone laid by hand; then over these came a layer of broken bricks passed through a 2½-inch mesh, and then through a 1-inch one, and finally through a ½-inch sieve, to take out the dust. Over the broken brick came good turves, grass side downwards. Materials for the border consisted of good turf roughly chopped, a few 1½ inch bones, and a little bone-meal, charcoal, lime and brick, passed through 1½ inch screener, and rammed in as solid as men could make it with a rammer. The results were good canes the first

year, three bunches on each cane the second year, and the third year Muscat of Alexandria Vines had bunches 7 to 11 lb. weight; Black Barbarossa, 13 lb. 12 oz., and all of them perfectly finished. In the other house I had a like result. I have kept Lady Downe's Seedling till June, Gros Colmar till April, and Black Alicante till nearly the end of March. I never put manure amongst the materials of which a Vine border is made, and I should always have it trodden as firmly as possible when dry, and the surface gently pricked over before affording water, which should never be in dribbles; in fact, a well-drained shallow border cannot have too much at a time, and when once watered, no water should be applied till it is required. My Vines are planted inside at the front of the house, their roots extending into the outside border between the piers which support the front wall, and from the Vines the surface of the soil slopes both ways. *Shirburn*.

ALLOTMENTS (see p. 688).—There is every reason to suppose that the number of allotments now in existence is at least 150 000 more than the number in existence at the time that the Allotments Act of 1887 was passed. This can scarcely be called "relatively few." *J. L. Green, Secretary, Rural Labourers' League.*

ODONTOGLOSSUM CRISPUM VAR. STEVENSII.—In my reference to this plant at p. 684 of last issue, I, in my ignorance, stated that the plant was named in compliment to Mr. Stevens, of Walton Grange. I have been informed by that gentleman that the honour is not his, but belongs to Zadok Stevens, who was many years gardener at Trentham. *Viator*.

HORTICULTURAL PROGRESS.—When Mr. Watson tells us that "Orchid culture, and, indeed, indoor gardening generally, has been much advanced within the last fifteen years in consequence of improved methods, &c.," we are led to inquire into the nature of the "advance" that has been made. That good culture has been wonderfully and widely diffused during the epoch named I willingly admit, but the actual cultural advance of any section of indoor gardening is but slight, if any, if we except the new plants and new varieties introduced. In a word, importations have advanced; and hybridism, cross-breeding, and selection have advanced, but that Orchids, or Grapes, or Ferns, or vegetables, or trees and shrubs are better grown to-day than they were fifteen, or even fifty years ago, I very much doubt. There are plants now popular that were not fashionable twenty or thirty years ago, Palms and Bamboos, for example; but Palms, even, are not better grown to-day than they were by the best cultivators twenty years ago—but I admit that thousands of Palms are now well-grown for one well-grown long ago. What culture could be finer than that of hard-wooded greenhouse plants twenty or thirty years ago? Where are now the splendidly-cultivated stove plants, the numerous kinds of *Ericas*, the succulent plants, the *Geraniums* or *Pelargoniums*, and especially the East Indian Orchids, the specimen *Vandas*, *Acridas*, *Saccolabiums*, and *Phalaenopsis* of from fifteen to fifty years ago? All these plants exist in our gardens by the thousand now, perhaps, for the units of the time named, but there are no such well-grown individual specimens as used to appear at the flower shows from 1830 to 1870. I freely admit that the general diffusion of good culture and of good plants is enormous during the past fifteen years, but, with few exceptions, there has been no general advance *per se* in the best methods of culture itself. There have been changes of fashion, and diffusion of tastes and requirements in all directions, a run on South American Orchids, such as *Cattleyas*, *Laelias*, *Odontoglossums*, &c., instead of one on *Vandas*, *Acridas*, *Phalaenopsis*, and *Saccolabiums*, that is all. In a word, what we have gained in one direction we have but too often lost in another; it has not been by any means a steady advance along the line. Of course, Mr. Watson deserves our best thanks in defending the British gardener from Mr. Lyden's ill-considered remarks. It is all very well to single out one or two places in Belgium where certain phases of culture may equal or even surpass those in England, but I very much question whether the facts are not far more often the other way. Certainly, no Orchid nursery I ever saw on the continent in any way equals that of some to be seen nearer home, and no private collection comes near to that of Baron Schroder in careful selection and good culture. Even in Grape culture, continental cultivators had to yield the palm to Mr. Meredith, who electrified them with the splendid Grapes he took over to their exhibitions from the vineyards at Garston, near Liverpool. It

is quite likely that in Pear culture the French and Belgians may surpass us, thanks to their higher summer mean temperature and superior amount of sunlight, but even of that I am not fully assured. I believe we might learn from the French and Belgians in their thriftiness, i.e., in the art of utilising their often limited resources in the most profitable manner. Again, in preparing and in marketing their produce, be it fruits and vegetables, or plants and cut flowers, the small growers in France and Belgium are far ahead of our own. Nothing strikes one more in continental tours than the clean, fresh, and dainty neatness with which the humblest of cultivators invest their wares. As Mr. Watson suggests, it is but seldom if ever wise to adopt even the most successful of methods *in toto*. We may now and then improve our own methods by assimilating and adapting by taking a hint, as it were, rather than by abandoning our own and adopting some one else's method. All real progress or advancement is slow, and in gardening this is especially so, seeing that its prime factors, light, heat, and moisture form a shifting index every season, nay, almost every day in the year. *F. W. B.*

LATE SCARLET-RUNNER SEANS.—At the exhibition of the Isle of Sheppey Chrysanthemum Society at Sheerness on the 16th ult., a capital dish of Scarlet Runners, gathered in the open air, was seen in a collection of six dishes of vegetables. That fact appears to me to almost establish a record. The Isle of Sheppey, in common with many other seaside places, enjoys a comparative immunity from frost, and so crops of Scarlet Runners were only slightly touched on this south-eastern shore; whereas, in other places farther away from this sea there was an almost entire destruction of any out-door plant of a tender character. That Scarlet Runners have been late and good generally is one of the characteristics of this season. Plants stunted in growth while the drought prevailed, awoke to a new life when the rain came, and then making a free growth, blossomed and bore fruit at a much later period of the year than is usual. It may be mentioned, that the practice followed by some gardeners of the old school of keeping roots of Scarlet Runners through the winter to plant in spring, on the ground that they obtained an earlier crop, seems to have quite died out among the community. *R. D.*

A BRASSICA SHOW.—A very odd notion is that which prevails at Limsfield, Surrey, of holding an exhibition of the Brassica family. The competition is promoted and conducted by the local Gardeners' Association, and seems to be chiefly restricted to the holders of parish allotments, where, it would appear, arising from the competition, most of the members of the Brassica tribe are well done. Classes are arranged for heads of Savoy, red, and other Cabbages, stems of Brussels Sprouts, heads of Kale, &c., and it is not difficult to have a very interesting though it may not be a very large exhibition. It was an admirable idea to offer the prizes to allotment holders, as in that way great encouragement is given them to produce good samples, and at the same time the competition is fixed at a time of the year when all descriptions of Brassica of a hardy nature may be had at their best. The prizes are small, but they suffice to make a very good competition. The show of the present winter took place on December 1, just in time to escape the very sharp frosts which immediately followed. The autumn was one of the most favourable for Cabbage production, with all its allies. Everywhere, whether in market fields or allotments, or in private gardens, the wealth of green produce is almost remarkable. Even till the recent sharp frosts, Autumn Giant Cauliflowers have been fairly abundant. There was at one time some dread lest the growth would prove to be so rapid as to be of a tender nature, and thus soon become harmed by frost. That fear does not now exist, as all forms of Brassica, exclusive of the late Cauliflowers, seem to be well seasoned. There can be no question but that, let the summer crops have been what they may, every effort was made to obtain a winter abundance with great success; that has specially proved to be so in cottage gardens and allotments, and it would naturally be looked for in other gardens. *A. D.*

PINUS INSIGNIS.—Within a hundred yards to the south-west of my house, in Longford Park, there grows the largest specimen of *Pinus insignis* which I know of, and next in size to the one at Bowood, North Wilts. The Longford specimen was, I have been informed on good authority, transplanted out

of a 6 inch pot into its present position on April 23, 1845. The tree is furnished with healthy branches from the ground upwards, and its dimensions are as follows: height 60 feet, diameter of branches 55 feet, circumference of trunk at 1 foot from the ground 15½ feet. Between this point and 7 feet from the ground are eleven large branches or arms. These measure respectively in circumference, 5 feet, 6 feet, 3 feet 9 inches, 5½ feet, 3½ feet, 4½ feet, 5 feet 9 inches, 4½ feet, 4 feet 3 inches, 5½ feet, and 4 feet 3 inches. The girth of the main upright stem at 7 feet from the ground is 9½ feet. The soil in which the tree is growing, and which evidently suits its requirements in every way, is a yellow loam, about 2 feet in depth, and resting on a gravelly subsoil within 7 feet of the ordinary level of the water of the River Avon. It would be interesting to know if there are any finer trees of this Pinus in the United Kingdom, and, if so, where. *H. W. Ward.*

HOW CHRYSANTHEMUM EXHIBITIONS MIGHT BE IMPROVED.—All true lovers of Chrysanthemums must, I should think, hail with satisfaction the notes by Mr. Douglas on p. 684. On visiting an exhibition how often one hears the remark, "What a mass of colour!" and true enough it is; especially in the groups. In my opinion a great improvement might be made in arranging if something was done to take away that stiff and uniform appearance so prevalent at the present time. Instead of being so densely packed, as they are, with huge flowers, how much better the effect would be if they were not so close, and if the foliage plants used to tone down the body of colour. It seems a pity also that Pompons should be discarded, as they are, from the groups in many cases, for all must admit that a well-grown Pompon is quite as pretty as a huge-flowered Japanese, of which the groups generally consist. I have heard the subject argued a good many times at our local exhibitions in Essex, but without any good result. I thoroughly believe that if one of the larger societies, the National, for instance, would once give it a trial, it would very soon find favour with the majority of exhibitors. For it seems to me that if something be not done to add to the popularity of this fine autumnal flower, in some places the societies will gradually die out of existence. *F. Everitt, The Gardens, Tyllus, Ingatestone, Essex.*

BOUGAINVILLEA GLABRA FLOWERING OUT-OF-DOORS.—It may be interesting to readers of the *Gardeners' Chronicle* to know that the above plant flowered well out-of-doors at this place during the past autumn, and I noticed to-day, November 27, two bright flowers still on the plant. It is growing against a south wall and well sheltered, was planted in April of the present year, and at that time was nearly destitute of foliage. Having been kept dry for some time previously to planting it, but with assistance from weak liquid manure, it grew rapidly, and by June had made strong growths right and left, which, aided by the heat of an almost tropical summer, pushed forth several flowers. The longest growth made from the time of planting measures 6 feet, and at present the plant is well covered with its dark green foliage, although we have registered 5° of frost, spoiling out-of-door Chrysanthemums. With a due amount of covering up at night, this handsome climber will succeed in the milder parts of this country, especially if a warm site be chosen for it, and the drainage of the soil is good. The plant here bids fair to pass the winter unhurt. From experience gained on the Riviera, where Bougainvilleas luxuriate, nothing seems to cut them up so much as cold winds accompanied with a few degrees of frost. I have seen large specimens, covering the fronts of villas of two and three stories high, browned in nearly every leaf with the cold mistral winds. But the wealth of bloom to be seen in the early spring months must be seen to be fully realised. *J. Benbow, Abbotshury Castle Gardens, Dorsetshire.*

THE ROYAL HORTICULTURAL SOCIETY.—Your note respecting the possible return of the Society to South Kensington naturally created some alarm in the minds of Fellows, and especially of those who remember the disastrous days associated with that unhappy locality. It may be that the Scottish Drill Hall is far from being all that can be desired; all the same, it is just now becoming more and more popular both with Fellows, exhibitors, and the public. We could never hope to see at South Kensington such shows as have of late been found at the Drill Hall; shows, it is but just to say, which have never been excelled in the Society's

history. The voice of objectors to the Drill Hall is now dumb, we no more hear it termed an ash-pit; indeed, it would be very difficult to find on the whole a place in London more roomy, more accessible, and more quiet. We have all got to know where the Hall is, how most easily to reach it, where to find what South Kensington does not afford,—ample outside refreshment accommodation, and it enables anyone to transact business in London before or after the usual meetings with facility. Just now, too, the public are getting to know the Hall; and if next spring the Council would but help to make the meetings more widely known, the attendance would be much larger. At South Kensington it would be found needful to promote smoking concerts and variety shows to attract attendances; now the meetings are dependent upon their intrinsic merits, and it is by far the best they should be so. We want no Merry-Andrew displays associated with our Royal Horticultural Society's meetings. Let the Council remember the old adage, "A rolling stone gathers no moss;" and it is just beginning to collect a little of the useful substance now. I cannot but think if the question of removal back to South Kensington were submitted to the next general meeting of Fellows, it would be negated by an overwhelming majority. *A Fellow.*

SUTTON COLDFIELD To many persons, Sutton Coldfield may not be familiar, but it is a charming locality not far from Birmingham, and was a noted place so far back as the fifteenth century, when it formed a portion of the great hunting grounds of royalty connected with the well-known Cannock Chase, lying betwixt Sutton and Rugeley, a district now very much sacred to coals, for it is a great coal district. Sutton possesses a park and woods, consisting of about 1800 acres, which is exclusively the open property of the inhabitants of Sutton, but under the charge of the Corporation; this is a great resort of the Birmingham people in the summer time, and has always been famous for many of the rarer British plants, some of which are now scarce there, whilst others have almost, if not quite, disappeared. The Sun Dew, *Drosera rotundifolia*, and others were abundant there a few years since, and one species still grows there, but *D. longifolia* has become almost extinct. *Pinguicula vulgaris*, the common Butterwort; also *P. lusitanica*, the pale Butterwort; *Orchis mascula*, the great purple Orchis; and *O. maculata*, the spotted Orchis; *Alisma plantago*, the great Water Plantain; *Ranunculus lingua*, the great Spearwort; *Typha angustifolia*, the lesser Reed Maw; *Reseda luteola*, the wild Mignonette; *Solidago Virgaurea*, the common Golden Rod; and *Linaria vulgaris*, the common Toad Flax, are all to be found here; and *Parnassia palustris*, the grass of Parnassus, is plentiful; *Blechnum Spicant*, a very familiar hardy Fern, was formerly tolerably plentiful in the woods, and was supposed to have become extinct, but was found again this year. The Club Moss, *Lycopodium clavatum*; *Ranunculus Lenormandi*, *Pyrus aria*, White Beam; *Saxifraga granulata*, the Meadow Saxifrage; *Vaccinium oxycoccus*, the Cranberry; *Vaccinium Vitis Idæa*; and *Orchis latifolia*, the Marsh Orchid, are all amongst the denizens of Sutton Park and woods. *W. D.* [An account of a Chrysanthemum fruit and vegetable show at this town will be found on another page. *Ed.*]

SOCIETIES.

ROYAL HORTICULTURAL.

Lecture on Late-keeping Grapes.

NOVEMBER 28.—In the afternoon a paper on the above subject by Mr. T. Crasp, Clyde Valley Nurseries, Swansea, was read by the Secretary. In commencing his paper, Mr. Crasp stated that hundreds of tons of Grapes were now grown in Britain for the market. The value of the fruit for such purpose materially depended upon the length of season during which the fruit could be had. It was better to grow late-keeping Grapes, than to force exceptionally early for the supply in spring. To insure a supply of late Grapes it was not sufficient that late varieties be planted, but the best of culture must be given them to the end that the fruit be thoroughly matured in every way. Mr. Crasp said, in speaking of soils, there were but few places where the soil was just what the Vines required—and where it was only necessary to dig it about a couple of spits deep, as a preparation, and the natural drainage was sufficient. Where fresh soil has to be

obtained, it should consist of substantial loam that will last some time, avoiding, however, a heavy or adhesive soil. It was better to buy, even at a little trouble or expense, some good sound turfy loam—that will be sure to suit the Vines. Care should always be taken to ensure a fair quantity of lime in the soil, as this was imperative to the stoning of the fruits. The lecturer then said that the idea that it was impossible to feed Vines too liberally was now quite exploded, and in making a new border the best growers were now content to add a moderate quantity of crushed bones. Afterwards, if the Vines showed any weakness, a well-decomposed manure could be given, and, during the fruiting season, they would enjoy frequent applications of liquid manure. The depth of border recommended by Mr. Crasp was 2 feet minimum and 3 feet maximum. The site was important, and should not be low, damp, and impossible of draining, but of reverse conditions entirely.

In choosing canes, whether those raised by the planter, or bought from the nursery, the lecturer advised free-grown canes, that were not stunted, nor extra luxuriant in growth. The distance of the wires from the roof should be sufficient to allow ample room for foliage, &c. The distance between the plants should never be less than 2 feet, and Muscats required quite double the space allowed others. The fruit ought not to be kept hanging too long, as late Vines were often rested insufficiently. As a rule, they should not be allowed to hang after January. During the time the Vines were resting, care should be taken that the borders do not become too dry, for whilst too much water at this time was prejudicial, greater harm would result from the soil becoming dust-dry. Outside borders might be covered to prevent saturation from snow, but as far as could be allowed with safety, they would be the better for exposure. Where the Vine-roots are inside and outside, the border should be kept at nearly the same temperature as practicable. Late-keeping Grapes required a long time to grow, and should be started as early as is possible without excitement. March or early April was the best time. A temperature of 50° to 55° at night would be easily kept, and was sufficient.

Disbudding and stopping ought to be assiduously attended to, and only a requisite amount of foliage retained. A small quantity of well-developed and matured foliage was better than a larger quantity which had not room to become so. White Grapes—especially Muscats—would require more exposure to light than black ones.

In speaking of the flowering and setting period, Mr. Crasp referred to Muscats and others that produced sufficient pollen for their own fertilising, and remarked that shaking of the rods, or the use of a soft brush kept for the purpose would be sufficient. Alnwick Seedling and such-like varieties, on the other hand, would require pollen taken from another variety, which could be easily done with a soft brush.

Thinning was another important point in producing Grapes for keeping long, and each variety must be thinned with due regard to its habit, and the ultimate size of its berries. Where bunches were produced too freely, some of these should be removed. Overcropping would not pay the private grower, although it was practised a good deal with market growers on strong, young Vines with but little injury. The temperature during the summer was a question for the growers' judgment, and the hard-and-fast rules that once obtained were unnecessary. It might consist of an increase of 5° until the flowering stage, and of another 5° after that time. The highest temperature to be allowed either during the morning with air, or when closed in the afternoon, might be about 90° or a little more.

Spacious span-roofed houses were best in most localities, but in some damp cold situations lean-to structures were necessary to thorough ripening. The application of water was a matter of the greatest moment, and required much judgment. It might be safe to give Vines about 18 gallons per square yard each month during the summer. Cold liquid should be avoided, or a check would result. Damping and syringing were next alluded to, Mr. Crasp remarking that whilst some growers discarded the syringe altogether, others used it with but very little intermission. If damping was always and thoroughly attended to, it might obviate the use of the syringe altogether. Proper ventilation was of the highest importance. Care should be taken to ventilate early enough in the day, putting a little air on as soon as the sun was felt in the least, and afterwards gradually increasing the amount.

Directions for the proper management of the fruit-room were now given, and a temperature of 45° advised, with no stagnant moisture in the place. After the Grapes were bottled, they might be occasionally looked over to refill the bottles with water, and at such times the end of the stem should be cut off. Mr. Crisp then gave the names of several varieties suitable for late keeping, together with short descriptions and directions for culture. Mentioned were Lady Downes' Seedling, Gros Colmar, Black Alicante, Mrs. Pinx, Alnwick Seedling, Gros Guillaume or Barbarossa, West's St. Peter, Black Maroc, Muscat of Alexandria, White Tokay, and Trebbiano.

NATIONAL CHRYSANTHEMUM.

General Committee.

NOVEMBER 20.—A meeting of the General Committee took place at Anderton's Hotel, Fleet Street, E.C., on the above date, R. Ballantine, Esq., in the chair, there being, as usual, a good attendance. A letter was read from Mr. John Smith, nurseryman, Windsor, complaining that none of the special prizes offered by Messrs. Pitcher & Munda for seedling Chrysanthemums at the November show were awarded. The secretary stated the judges made a report, setting forth that not one of the three exhibits staged was considered worthy of an Award. The Awards by the Arbitration Committee at the November show of several Medals to miscellaneous collections was confirmed. The secretary submitted a financial statement, showing that up to the 18th inst., the sum of £525 11s. 8d. had been received, of which amount £142 19s. 6d. was on account of annual subscriptions, and £39 7s. on account of affiliation fees; the sum of £219 10s. had been received from the Royal Aquarium Company. Several letters were read making suggestions as to alterations in the schedule of prizes, and also some proposed by members of the Committee, were referred to the Schedule Sub-committee. Twenty-four new members were elected, including one Fellow, the secretary reporting that 159 candidates for membership had been elected during the year, viz., 137 ordinary and 13 Fellows, and nine societies had been admitted to affiliation. At the close of the business, Mr. A. E. Shea should have read a paper on "Judging Chrysanthemums," but, owing to an attack of illness, he was prevented from attending, but sent his paper requesting it might be read for him. As the subject is an important one, and the points laid down by Mr. Shea are likely to cause discussion, it was unanimously resolved that the reading of the paper be postponed until such time as Mr. Shea could make it convenient to attend another meeting of the committee. A Vote of Thanks was passed to the chairman for presiding.

NOVEMBER 22.—A fully-attended meeting of the Floral Committee was held at the Royal Aquarium on the above date, a considerable number of new varieties being staged, and a good deal of interest was excited, especially over a large number of fine seedling Japanese from M. Erneet Calvat, Grenoble, France.

First-class Certificates of Merit were awarded to incurved William Tunnington, a fine variety in the way of Baron Hirsch, the surface of the petals amaranth, with a golden reverse; to Mrs. T. Denne, a very fine incurved Japanese, in the way of Stanstead Surprise, and of much the same colour, deep and full; to Japanese Le Prince du Bois, a large deep pale bronzy-yellow reflexed variety, of great beauty; and to Japanese Golden Gate, a remarkably fine variety, reflexed, and of a deep golden-yellow colour.

A bloom of Japanese Richard Denn was seen in better character than when shown before by Mr. Owen, and, had there been a companion flower, it would assuredly have obtained a First-class Certificate of Merit. Altogether Mr. Owen had a remarkably interesting collection of twenty English-raised seedlings, incurved, Anemone-flowered, and Japanese, and a Silver Medal was awarded.

Of M. E. Calvat's French seedlings, a collection of sixteen having been sent from Grenoble, First-class Certificates were awarded to Madame Carnot, a large white broad-petalled reflexed Japanese of high quality; to Deuil de Jules Ferry, a broad-petalled bright cerise-crimson flower, with a silvery reverse; and to Professor Lackman, a large incurved Japanese, amaranth, with silvery reverse. A Silver Medal was also awarded to this collection.

A First-class Certificate was awarded to Japanese Cecil Wray, a large golden bloom, shown by Mr.

E. Beckett, The Gardens, Aldenham House, Elstree. The following Commendations were awarded: to Japanese President W. R. Smith, a fine incurved flower, delicate pink, with a pale silvery reverse; Niveus, a large broad-petalled white reflexed Japanese; E. L. Jamieson, also an incurved Japanese, chestnut-crimson, with bright bronzy-yellow reverse; and Pompon Elsie Walker, a remarkably free and compact bronzy-orange variety, in the way of Frémy; all the foregoing were shown by Mr. R. Owen, nurseryman, Maidenhead.

A pretty reflexed Pompon, named William Kendall rose tipped, and margined with white, from Mr. J. P. Kendall, Roehampton, was Commended; also Japanese President Léon Say, a pale-coloured type of Edwin Molyneux, but decidedly pretty in colour, from M. E. Calvat, was also Commended; as was also a very promising incurved, named M. P. Martinac, pale yellow, in the way of Miss M. A. Ilagga.

In the way of single varieties, Mr. W. Wells, nurseryman, Earlswood, Redhill, had a collection of several varieties; one, an American variety, a Japanese, with very deep bright red flowers, named Tuxedo, is recommended for late-blooming, for decorative purposes, and the Committee wished to see a plant at a later meeting; Purity, a large broad-petalled white variety, appears likely to be very useful for cutting.

Several stands of Japanese and other varieties were shown by Messrs. Henry Cannell & Sons, nurserymen, Swanley, and a Bronze Medal was awarded.

A Vote of Thanks was awarded to Mr. R. Sindrey, Pentwyn, Monmouth, for Patty Harding, an incurved Japanese.

DECEMBER 5, 6, 7.—The mid exhibition held in the Royal Aquarium, Westminster, on the above-date, was quite exceptional, whether considered in regard to the quantity of blooms, or to the quality of those staged. In most of the classes there were numerous competitors, almost equal in number to that held a month ago, and extra prizes were awarded in most of the classes. The quality of blooms also was most satisfactory, especially in the case of the Japanese varieties. The incurved were smaller, and not nearly so exceptional.

In the first class, for twenty-four Japanese blooms of not fewer than eighteen varieties, the 1st place was taken by Mr. E. Rowbottom, gr. to H. R. Williams, Esq., The Priory, Hornsey, N., and the blooms were the best ever staged at the same date. Particularly noticeable were Etoile de Lyon, Madame Thérèse Ray, G. C. Schwabe, Beauty of Castlewood, and J. S. Dibben; 2nd, Mr. W. Collins, gr. to J. W. Carlisle, Esq., Ponsbourne Park, Hertford; 3rd, Mr. Henry Alderman, gr. to G. Hatfield, Esq., Morden Hall, Surrey.

Mr. C. J. Waite, gr., Glenhurst, Esher, Surrey, was well ahead in the class for twenty-four bunches of Chrysanthemum blooms, any varieties, staging capital blooms of similar varieties to those seen on the boards. Mr. E. W. Knowles, gr. to Mrs. Chas. Egerton, Solna, Roehampton, was 2nd, in this class including several nice singles; and Mr. Geo. E. Smith, Floral Cottage, Paul, Hull, 3rd.

Mr. E. W. Knowles was 1st for twelve bunches of Japanese blooms, of not fewer than six varieties, and one variety only in a bunch: Mr. W. Tipler, gr. to Miss Smith-Dorrien, Hartwell Villa, Aylesbury, was 2nd.

Twelve Japanese flowers were best from Mr. T. Turk, gr. to P. Bosanquet, Esq., Penfield, Hertford; the stand contained a very fine even lot of fresh-looking specimens. 2nd, Mr. W. G. Gilbert, gr. to B. C. Neve Foster, Esq., Lennewe Hall, Norfolk; Mr. E. Rowbottom was 3rd.

Mr. C. Cox, gr. to J. Trotter, Esq., The Grange, Brickenden, was 1st for six similar blooms, having Beauty of Castlewood, very large; and a nice bloom of Robert Owen. 2nd, Mr. W. Collins; and 3rd, Mr. H. Shoemith, gr. to M. Hodgson, Esq., Shirley, Croydon. There were two extra prizes awarded to competitors in this class.

Messrs. W. and G. Drover, Fareham, Hants, staged the best twelve blooms of incurved, but though even, they were small and not well-coloured; 2nd, Mr. W. G. Gilbert, and Mr. H. Alderman 3rd. The latter exhibitor, however, was 1st for six blooms, and the winners in the last class were 3rd; Mr. H. Shoemith was 2nd. Mr. Shoemith had also the best twelve blooms of Princess Teck; Mr. Gilbert 2nd, and Mr. Geo. E. Smith 3rd.

Mr. A. Newell, gr. to Sir Edwin Sandners, Fairlawn, Wimbledon, was 1st for six bunches of Japanese blooms; Mr. E. W. Knowles 2nd, and Mr.

D. B. Crane, 4, Woodview Terrace, Archway Road, Highgate, 3rd.

Miss Debenham, St. Peters, St. Albans, had a very attractive stand in the class for twelve bunches of singles, three sprays in a bunch: Admiral Bymonds, a large and fine yellow, was specially noticeable; Mr. W. C. Pagram, gr. to F. Hobhouse, Esq., The Whim, Weybridge, was 2nd, and Mr. G. E. Smith 3rd.

Mr. Thos. Lansley, 155, Pinner Road, Watford, was successful for six Japanese blooms (amateurs), and staged very satisfactorily; Mr. Ed. Spurge, Witham, Essex, 2nd; and Mr. F. Hicks, High Street, Elstree, 3d.

The best hall vase or epergne of Chrysanthemum blooms, open only to amateurs, was from Mr. D. B. Crane.

Mr. E. Rowbottom was successful in the class for six blooms of any new varieties of 1892 and 1893, the Silver Medal given by Mr. H. J. Jones, Hither Green, Lewisham.

The miscellaneous classes were almost without entries, and the three classes for Primulas were quite so. A few good plants of Cyclamens from Mr. W. Cook, gr. to the Hon. Sir Chas. Murray, The Grange, Old Windsor, were the only ones staged. The class arranged for a collection of flowering, berried, and foliage plants, arranged for effect on a table space of 9 feet by 6 feet, secured two exhibitors, the most successful being Mr. W. Howe, gr. to Henry Tate, Esq., Park Hill, Streatham, who had a lightly-arranged collection, including Crotons, Ferns, Solanums, Poinsettias, Callas, Calanthes, &c.; Mr. A. Newell, who was 2nd, had some good plants, but they were too thickly placed.

Miscellaneous Exhibits were numerous and novel. The method of exhibiting Chrysanthemums by nurserymen appears just now to be in a transition state, and it is pleasant to notice a general departure from the too stereotyped manner that had appeared almost without any variety.

Messrs. H. Cannell & Sons, Swanley, had Chrysanthemum blooms on boards, and also arranged in sprays, together with a bright display of Pelargonium blooms. Also an expanding show-board, for which a patent has been applied.

Mr. W. Wells (Earlswood Nurseries, Limited), Redhill, had a grand display of Chrysanthemum blooms arranged in a bank some 9 feet high, with an arch in the centre, in which a mirror had been placed.

Mr. Robt. Owen, Floral Nursery, Maidenhead, had good blooms arranged in bottles, three blooms in each, which were inserted into a ground-work of Ferns on a table, and looked very pretty.

Mr. H. J. Jones, Iyecroft Nursery, Hither Green, Lewisham, had a large and fine stand arranged in a manner somewhat resembling that at the show a month ago. Large handsome vases were tastefully arranged with bloom a good length, and the vases placed on a groundwork of Ferns. Each vase, taken separately, looked handsome; but the Ferns should have been a little higher, that the vases (although handsome) might have been less prominent. Mr. Norman Davies, Camberwell, had a table arranged with Chrysanthemums; and Mr. Geo. Stevens, Putney, had a very pretty table, being similar to that noticed from Mr. Robt. Owen. Mr. H. R. Williams, Hornsey, N., had a table arranged with Chrysanthemum blooms in bottles, plants of Primula sinensis, small Salvia, Cinerarias, Ferns, &c., which looked exceedingly tasteful; and a handsome and attractive appearance was that made by the stand of Mr. Henry Perkins, Greenlands, Henley-on-Thames, containing a good number of finely-flowered Amaryllis, interspersed with Palms, Ferns, &c. Mr. J. H. Witley, Nunhead Cemetery, had a group of Chrysanthemum plants; and Messrs. W. Cutbush & Co., Highgate, had a large table arranged with Heaths, Palms, Dracenas, Carnations, Orchids, &c., all well-grown plants. Mr. J. R. Chard, Stoke Newington, had a stand showing his floral arches, &c.; and Mr. C. E. Shea had a new kind of exhibition board, in four loose sections, that they may be placed at what distance is required by the blooms. Each section holds three flowers. Mr. C. J. Waite had a collection of vegetables.

In conjunction with the December exhibition of Chrysanthemums, a meeting of the Floral Committee took place, at which a number of novelties were staged.

First-class Certificates of Merit were awarded to Japanese Col. T. C. Bourne, a large bright chestnut reflexed Japanese, broad petalled and very fine, this came from Mr. Robert Owen, nurseryman, Maidenhead; also to Judge Hoitt, a large-flowered Japanese

Anemone, very large and full, but with several rows of guard petals, the colour blush, the basal petals deepening to pink, from Mr. H. J. Jones, Ryecroft Nursery, Lewisham; and to Amaryllis Charles Davis, reddish crimson, with a conspicuous white throat, from Mr. H. Perkins, gr. to W. F. Smith, Esq., M.P., Greenlands, Henley-on-Thames. Other new flowers were staged, but the standard set up by the Floral Committee being high, it is only very few that can gain the coveted award of a First-class Certificate of Merit. Among other new flowers was incurved Japanese Bessie Drover, pale lilac or pink; and incurved Mrs. Norman Davis, of a bright bronzy-golden colour, but which the committee, by a decisive majority, considered to be an incurved Japanese. Both the foregoing came from Messrs. W. & G. Drover, nurserymen, Fareham. Mr. C. E. Shea, Fooks Cray, Kent, sent some seedling Japanese, including Miss Maggie Blenkiron, a large incurved Japanese, having a bright salmon base and golden centre. Mr. J. Knowles, Headlands, Pontefract, sent a white reflexed flower in the way of Stanstead White, but which the committee thought to be too much of a Japanese. Mr. Norman Davis, Camberwell, had Potter Palmer, a large white Japanese in the way of Stanstead White, but with a flatter petal—certainly a fine, full flower. Mr. H. J. Jones, nurseryman, sent Mrs. Dr. Ward; and the same variety came from Mr. J. Gilbert, Seunowe Hall, Norwich, a large salmon-yellow flower, having hairy, broad petals, which the committee wished to see again. Mr. Jones also had W. G. Newett, a primrose-white reflexed Japanese of excellent shape; H. Jackson, a deep golden incurved Japanese, in the way of Lord Brooke, very fine in colour; Miss Rose Shotta, a large and full white Japanese; and F. L. Ames, deep gold, much in the way of W. H. Lincoln. Mr. J. P. Kendall, Roehampton, sent a large bunch of the white decorative variety, Florence Percy, to show its value for cutting. Mr. Owen had in addition to the variety named above, incurved Lord Rosebery (First-class Certificate of Merit) in the way of Violet Tomlin, but a flower of deeper build, promising to be very useful; Niveus, a large-broad-petaled pure white Japanese; Richard Dean, a large flower of the E. Molyneux type, which narrowly escaped receiving a Certificate; and Mrs. Smith Ryland, a large and promising incurved Japanese, in the way of Col. W. B. Smith, but of a brighter golden hue, which the Committee wished to see again.

A Commendation was given to the "Shoemith" Chrysanthemum-cup and tube, invented and exhibited by Messrs. Geo. Coppin & Sons, Addington, Surrey.

SCOTLAND.

PRACTICAL AND TECHNICAL TEACHING OF AGRICULTURE AND FORESTRY.

SINCE we had something to say of certain horticultural associations in Scotland, now engaged in promulgating technical and practical knowledge of horticulture, we have had correspondence from various quarters stating that associations are taking steps to establish ways and means for the advancement of tuition among young gardeners. The weak feature of the movement is, that at present only a small proportion of the head gardeners enlist themselves for service in aiding their younger brethren in the craft. One would have supposed that in Scotland, where there is so much enthusiasm at the present time in promoting schemes for educational purposes to meet the requirements of all classes of the population, head gardeners would have been among the foremost in doing their part. There are excellent schemes for promoting agricultural and arboricultural knowledge, and in Glasgow (where nothing is done in a half-hearted way when once floated), we have the technical college disseminating knowledge on a grand scale, where not only agriculturists and foresters, but gardeners are taking advantage of the excellent tuition put within their reach; and as many horticulturists have to make agriculture and arboriculture as much a part of their business as gardening, the instruction given by professors and other scientists is invaluable, and although there is nothing specially set apart for gardeners, there is much in the lectures which pertains to horticulture; and from what I learn from friends of

the cause, there is a likelihood of horticulture being represented in the scheme now at work for the benefit of the sister branches. The tuition is not merely confined to lectures and object-lessons, but students are taken to the fields and forests, where practical tuition of the most useful character is imparted. In the agricultural department there are taught agricultural chemistry, geology, zoology, book-keeping, surveying, and botany. There are, among numerous subjects, lectures on soils, plant-life, rotation of crops, manures (farmyard and artificial, &c.), sub-soiling, drainage, application of manures to various crops and soils, uses of lime, nitrification, poisonous plants, weed plants, and cultivated plants, the parts of plants used, and for what purpose; diseases of plants, and insects which infest them. For arboriculturists there is practical forestry, forest botany, and entomology; besides tree construction, tree structure, tree physiology, tree classification, and botanical description. Subjects which will be of much practical value to gardeners are, lectures on insects injurious to fruit crops, American blight (*Schizoneura lanigera*), Apple aphid (*Aphis mali*), &c. Insects which attack Gooseberries and Currants are described, as also the Strawberry moth. The lectures are to be illustrated by diagrams and specimens. John Young, Esq., M.A. (Secretary), 38, Bath Street, Glasgow, will give requisite information to all who are desirous of being associated with this grand scheme, and we trust much tangible good may be done. *W. Temple, Carron, N.B.*

EDUCATION IN HORTICULTURE.

This year again, through the liberality of the Edinburgh Town Council, the Council of the Scottish Horticultural Society have been able to arrange for a course of technical education in horticulture, open free to young gardeners and others interested in the advancement of this science. The course is to embrace seventeen lectures on the vegetable garden—a subject which will be dealt with by the lecturers from its chemical, physical, and practical sides. The scientific lecturers are Mr. Ivison Macadam, Mr. A. N. Macalpine, and Dr. Hunter; while the practical lecturers include Mr. M. Dunn, Dalkeith; Mr. A. H. Scott, Cambusdoon; Mr. Williamson, Tarvit, Cupar, Fife; Mr. Loney, Marchmont; Mr. P. W. Fairgrieve, Dunkeld; and Mr. Temple, Carron House, Falkirk. The introductory lecture to the course was delivered recently in Dowell's Rooms, Edinburgh, by Mr. M. Dunn, Dalkeith Palace Gardens. Mr. Loney, Marchmont, presided; and among those present were Professor Bailey Balfour, Councillor Mackenzie, Mr. David Laird, Mr. Robert Laird, Secretary of the Society, &c. There was a large attendance of young gardeners.

Mr. Dunn took up the special study of the winter's course, the vegetable garden, and discussed in an exhaustive manner the principles upon which such an undertaking should be conducted in order to make it horticulturally and financially a success. He explained how such a garden should be laid out, protected from winds, sown, manured, tended, and reaped; he showed how a certain rotation in cropping was good in the garden as well as in the fields, and from his long experience of such work gave a number of average prices and quantities relating to the various branches of expenditure in every well-managed garden. *Scotsman.*

ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.

The executive committee of this Society met on Saturday evening, the 2nd inst., Sir Arthur Grant, Bart., of Monymusk, presiding. The Chairman thanked the Society for electing him to that office, and assured the meeting that any service he could render for the benefit of the Society would be cheerfully given. Sir Arthur touched on various methods to be adopted, in order more fully to carry out the primary objects of the Society in the advancement of scientific horticulture, such as closer assimilation with the societies in the south, the sending of one or more directors to great shows, to gain additional insight; the providing of lectures during winter on horticulture and arboriculture, referring especially to the effects of the recent gales on trees in connection with the last-mentioned art. Ultimately the matter was remitted to a sub-committee to bring up an early report. The question of exhibitions next year was then discussed, and the Secretary instructed to communicate with the Aberdeen Town Council and the Highland and Agricultural Society of Scotland, whose exhibition will be held in Aberdeen next year. Thereafter, on the motion of Mr. Robson, Sir Arthur Grant was cordially thanked for presiding.

TREES AND SHRUBS.

TREES AND SHRUBS FOR AUTUMN COLOURS.

DURING the past autumn, the foliage of many trees and shrubs has been remarkably rich, more so than usual, and a few kinds were especially noted for their beauty in nurseries and gardens. The hardy Azaleas are very fine in autumn, the leaves changing to splendid colours, crimson and yellow shades, mixed with bronzy-green. In planting shrubs, their effect in autumn should be considered, as well as the beauty of their flowers or habit of growth. A group of hardy Azaleas in late September and October is as pleasing in its way as in the early days of June, when every branch is laden with fragrant bloom. If backed with evergreen shrubs, as one sees in the beautiful garden at Dropmore, the rich and diversified colouring of the leafage is intensified. Amongst Spiræas, nothing is more attractive for the colour of the leaves in autumn than *S. Thuinbergi*, which changes to a self crimson colour, peculiarly rich and bright in the sunshine of an October day. The foliage is retained for some time, and does not lose its splendid colouring. The *Acers*, varieties of *A. palmatum* in particular, and such species as *A. rubrum*, are very showy, and a group of the former is as cheerful as a bed of flowers. Mr. G. F. Wilson's garden at Wisley was very beautiful with the autumn tints, especially with the *Liquidambar styraciflua*, *Andromeda arborea*, and *Vaccinium pennsylvanicum* (Pennsylvanian Blue Berry), three of the finest things we have for autumn colour. The *Liquidambar* is one of the most showy of North American trees in late September and October. It is unique almost in this respect, the leaves changing to deep blood-purple and red. *V. pennsylvanicum* is worth planting for the sake of its leafage in autumn alone. The bush is in October brilliant with its scarlet foliage, and a good specimen lights up the garden with colour. Very fine also for its colour is *V. corymbosum*, which has pinkish-coloured flowers. The *Taorns* (*Cratægus*) are splendid for their autumn colours, and *C. coccinea* is richer than any, the leaves turning to a scarlet shade, touched with purple. A specimen of this, when in free beauty in autumn and laden with scarlet fruits, is striking. It is a pity that the forms of *Cratægus* are not more planted in English gardens. They are, as a rule, picturesque in growth, beautiful when in flower, and in autumn amongst the brightest dwarf trees in gardens for leaf-colouring and fruit. *Virgilia lutea*, the yellow wood of the United States, has leaves which change in early autumn to a deep golden colour. The *Viburnums*, especially *V. plicatum*, *Parrotia persica*, *Rhus cotinus*, *R. c. purpurea*, the leaves dying off a yellow and fine red colours; and the Oaks may also be mentioned. *Quercus coccinea splendens* is remarkably rich and very fine in Mr. Waterer's nursery at Knap Hill. There are many other trees and shrubs of great beauty for their richly-coloured leaves in autumn, but those enumerated we have made special note of lately. *J.* [The soft yellow tint of the pinnate leaves of *Koeleria paniculata* should cause its inclusion in the list of picture trees. *Ed.*]

Obituary.

E. S. DODWELL.—Carnation-growers all the world over will receive with regret the intelligence of the death of Mr. Ephraim Syms Dodwell, at The Cottage, Stanley Road, Oxford, on November 30, at the age of 75 years. He was buried in the Holywell Cemetery, Oxford, on December 5, a large circle of relations and personal friends gathering about his grave.

Mr. Dodwell was a native of Buckinghamshire, having been born at Long Crendon, in that county, on November 28, 1819; and, up to the time of his leaving to take an important position in a house of business at Derby, he was engaged in commercial pursuits in London, going to Derby in 1845; while

there, he developed that love for floriculture which he never lost; and the Picotee form of the Carnation was his especial fancy. He threw himself with great ardour into its cultivation, in raising new varieties, in improving the standards of excellence, and in the promotion of Carnation and Picotee exhibitions. He became the Secretary of the Midland Horticultural Society, the meetings of which were held at Derby; he was a hearty supporter of the National Carnation and Picotee Society, and on the occasion of the annual exhibition of the latter in 1854, at the Derby Arboretum, a testimonial was presented to Mr. Dodwell, consisting of a purse of sixty-five sovereigns, and an address on an elegantly framed scroll, in recognition of his services on behalf of the Midland Horticultural

up his residence at Clapham, cultivated the Carnation and Picotee with marked success. In conjunction with the late Mr. Charles Turner, he was instrumental in forming the southern branch of the National Carnation and Picotee Society, and in doing so gave a great impetus to the cultivation of the Carnation in the London district and adjacent parts.

In 1881 Mr. Dodwell removed to Oxford, and soon after established the Carnation and Picotee Union, the first exhibition of which was held in 1885. At Oxford he formed a Carnation garden of a unique kind, and he entered upon the work of raising new varieties with great ardour and considerable success, putting into commerce from time to time fine varieties of all sections. The exhibitions of the Union in his garden proved a great attraction, and as they

the Oxford Union, and the Midland Carnation and Picotee Union, attest to the success which attended his efforts.

Mr. Dodwell leaves a widow and sons and daughters to deplore their loss. He also leaves a wide circle of friends to share with his family the sorrow.

JAMES BURR.—Many old gardening friends will regret to hear of the death of Mr. James Burr, which took place at Washington, U.S.A., on November 11, from fever contracted whilst on a visit to the Chicago Exhibition. Mr. Burr was one of the old school of gardeners, who had received the groundwork of his knowledge at one of those princely establishments in Scotland where gardening is conducted in such a thorough manner, and which have produced so many men who have become eminent in their profession. He came to England when a young man, and held some first-class appointments during his time, notably as head Gardener to the Duke of Manchester, at Kimbolton; to Lord Wantage, at Lockinge; to Sir J. Thorold, at Syton, his first place as head gardener; and at Biddulph Grange, once a famous show place in Staffordshire. And before going out to the United States to lay out an estate for one of the American millionaires, he did useful service in laying-out several of the London churchyards and squares, and in street-tree planting for the Metropolitan Public Boulevards Association.

He was one of those honest, upright, and industrious men, who carefully weighed his intentions, and prepared his plans with much ability, and executed them with intelligence.

THE LATE MR. E. S. DODWELL. (SEE P. 725.)

Society. In making the presentation, testimony was borne to his "unflagging energy, indomitable perseverance, and unconquerable pluck," qualities which he exhibited all through his life. At that time Mr. Dodwell was a raiser of seedling Picotees, and in the pages of the *Midland Florist*, conducted by the late Mr. J. F. Wood, and in the *Florist*, at that time edited by the late Mr. C. Turner, he was constant in writing in the interest of the Carnation and Picotee, and did much to improve its cultivation, and raise the standard of excellence.

In 1856, in conjunction with the late Mr. John Edwards, of Holloway, he started and conducted *Gossip of the Garden*—an excellent florist's periodical in its day. He also became a partner in the firm of Messrs. Holland, Dodwell & Bayley, Florists, at Cheddington and Manchester, but the association did not continue for any great length of time. Mr. Dodwell left Derby for London in 1860, and taking

partook more of a social and friendly character than any which had preceded them, they were largely attended, and in addition to the many varieties staged for competition, the extensive floral treasures of Mr. Dodwell's garden were also open to inspection. His last work appears to have been the issuing of the Annual Report of the Union for 1892, which always took the character more of an annual than a mere matter-of-fact report. In 1886, Mr. Dodwell issued the first edition of his book on the Carnation and Picotee, which was widely distributed; and two years ago he issued a new and cheaper edition, with chapters on the yellow Carnation. He was one of the first to take in hand this section of flowers, the Kilmurry Yellows affording him an excellent start, and he raised many seedlings of high quality. No one has laboured longer and more earnestly and persistently in making the Carnation popular, and

OLEARIAS OF NEW ZEALAND.

This fine genus comprises nearly one hundred species of ornamental shrubs or small trees, all of which are confined to Australia and New Zealand, no species being common to both countries. It comprises plants of varied habit, foliage and inflorescence from almost prostrate shrubs to trees, with a trunk 2 feet in diameter; from small linear to broadly ovate leaves 4 inches in diameter; from species with solitary or fasciculate flower-heads, to those with a large panicle inflorescence; lastly, from species with minute flower-heads, containing only a single floret to those large heads containing many hundreds of florets. The species with large flower heads, are perhaps the most attractive to the cultivator, and possess the greatest interest for the botanist. All are of remarkable beauty, and with one exception, all are confined to the southern extremity of the colony, or to the outlying islands. Why the Compositae, with attractive violet-purple disc florets, should be restricted to such narrow limits, might form an interesting subject of enquiry, but would be somewhat outside the scope of this paper, yet the fact remains that with the exception of two fine *Collinsias* restricted to the Auckland and Campbell Islands, and four species of *Olearia*, restricted to Preservation Inlet, Stewart Island, and the Chatham Islands, all the species of these fine genera have comparatively unattractive white or yellow disc florets.

With one exception, all the species of this section have rigid and excessively coriaceous leaves, which are toothed, or crenate, or doubly crenate, the crenatures being very narrow, and often reduced to rounded callous points. In the mature state, the leaves are glossy or shining above, and white, with appressed tomentum beneath. They vary in shape from narrow lanceolate to broadly ovate or orbicular ovate, and may be sessile or petioled. The flower-heads are either solitary and carried on slender or robust terminal peduncles, or arranged in terminal racemes, and they may be either rayed or destitute of rays.

All the species are easily managed under cultivation, and require very little special treatment; they bear cutting-in freely, and are readily propagated by layers or cuttings. A mixture of peat and loam is suitable for all the species except *O. insignis*, which

prefers limestone; but they will flourish in any ordinary garden soil. The following brief descriptions of the species comprised in this section will be found useful to the cultivator:—

A.—FLOWER-HEADS ON TERMINAL PEDUNCLES.

1. *Olearia semi-dentata*, Decaisne, Hook. f., in *Flora of New Zealand*, i., 115.—A charming shrub, 1 to 2 feet high, with slender branches, and linear-lanceolate leaves $1\frac{1}{2}$ to 2 inches long, $\frac{1}{4}$ to $\frac{1}{2}$ inch broad, distantly toothed, narrowed at the base, and white beneath. Flower-heads on slender peduncles 1 to 3 inches long, few or many at the tips of the branches. Ray-florets purple, disc-florets violet-purple. J. Buchanan, *Trans. New Zealand Institute*, vii. (1874), t. 14. Hab., Chatham Islands.

2. *O. Chathamica*, n.s.—Of similar habit to the preceding but more robust, and with very coriaceous leaves, 1 to 2 inches long, $\frac{1}{2}$ to $\frac{3}{4}$ inch broad, ovate or oblong lanceolate, white beneath, serrate, teeth narrow, with obtuse callous tips, narrowed into a short broad petiole, acute. Flower-heads few on slender peduncles with distant linear bracts. Involucral leaves in two series, acute, ray florets rather broad, white, disc florets violet-purple. O. operina, *Handbk. N. Z. Fl.*, 731, not of p. 124. O. angustifolia var. J. Buchanan, *Trans. New Zealand Institute*, l. c., t. 15, not of Hook. f. Hab. Chatham Island. A charming species of remarkably easy cultivation, but like the preceding, apt to die out in a few years unless cultivated in soil of a peaty character.

3. *O. operina*, Hook. f., *Fl. N. Z.*, i., 115.—A sparingly branched shrub, 6 to 12 feet high, with rather stout branches. Leaves spreading, very coriaceous, narrowly obovate-lanceolate, narrowed at the base into a winged petiole, teeth close, obtuse, callous. Peduncles, 1 to 3 inches long, clothed with short overlapping bracts. Heads large. Syn. *Arnica operina*, Forster.

Var. B, with more robust branches, shorter and more coriaceous leaves with longer teeth. Hab. South Island, Martin's Bay to Preservation Inlet.

The flower-heads vary in number, as many as eighteen have been counted on the extremity of one branch, but the usual number is from six to eight. Ray florets white, with yellow disc. In the young state plants are of a strict compact habit, which becomes straggling with age.

4. *O. angustifolia*, Hook. f., *Fl. N. Z.*, i., 115.—A shrub or small tree, 6 to 20 feet high, with robust branches and narrow lanceolate acuminate leaves, 3 to 5 inches long, glossy deep green above, white beneath, excessively rigid and coriaceous, crenate or doubly crenate. Heads, $1\frac{1}{2}$ or 2 inches in diameter, on stout peduncles, which are shorter than the leaves, and clothed with foliaceous bracts. Disc-florets deep violet-purple; ray-florets white. T. Kirk, *Forest Flora of New Zealand*, t. 138. Hab., Stewart Island. Distinguished from all the species with solitary heads by the rigid foliage and foliaceous bracts. The foliage emits a delicious fragrance.

This grand plant, in my estimation, is the most beautiful of the genus. "Looking down from some sea-cliff in the southern portion of Stewart Island, the visitor may see below a compact, dense-shaped head, 30 feet in diameter; the narrow rigid leaves of the deepest green are seen to be white beneath as the branchlets are stirred by the breeze. Carried on the tips of the branchlets are clusters of from four to ten large flower-heads, each about 2 inches in diameter, with a rich deep purple disc surrounded by snow-white rays, the separate clusters resembling large bouquets, set in deep green, and producing one of the richest effects imaginable."

B.—FLOWER-HEADS IN TERMINAL RACEMES.

5. *O. Traillii*, T. Kirk, *Trans. N. Z. Inst.*, xvi. (1883), 372; *Forest Flora of N. Z.*, t. 142. A handsome shrub or small tree 15 feet high or more, with stout branchlets. Leaves crowded near the tips of the branchlets, $\frac{1}{2}$ to 6 inches long, 1 to $1\frac{1}{2}$ inch broad, lanceolate or narrow obovate-lanceolate, acute, coriaceous, white beneath, margins doubly serrate or crenate. Heads crowded, in erect terminal

three to eight-flowered racemes, with deciduous foliaceous bracts; peduncles, &c., white, with appressed tomentum. Rays white, disc violet-purple. Hab., Stewart Island and Puysegur Point. Rare and local. One of the most striking plants in the New Zealand Flora.

6. *O. Colensoi*, Hook. f., *Fl. N. Z.*, i., 115, t. 29.—A shrub, or really a tree, 40 feet high, with a trunk 2 feet in diameter; leaves broadly oblong, or ovate, acuminate, shortly petioled, white beneath, doubly serrate, or crenate. Heads in terminal racemes, 3 to 8 inches long, rayless, dark lurid purple, approaching black. The dark-coloured disc flower-heads form a strong contrast, with the rhachis and peduncle, which are snow-white, with appressed tomentum. Hab., North and South Islands, Stewart Island. In the North Island this species is a mere shrub, 3 to 6 feet high, and rarely occurs below 3000 feet, being confined to the Ruahine and Tararua Mountains. On Stewart Island it descends to the sea-level, and sometimes forms a tree 40 feet high, as already stated. It is probably the largest species of the genus, although the Australian *O. argophylla*, F. Mueller, approaches it very closely. Its branches are extremely tough, and as they are interlaced with other shrubs, the plant forms an obstacle to mountain climbing in Stewart Island not easy to overcome. It is the "mutton-bird wood" of the southern natives, and so called from the mutton-birds (petrels) frequently making their burrows amongst its roots.

7. *O. Lyallii*, Hook. f., *Fl. N. Z.*, i., p. 116.—Similar in habit to the last, and attains the height of 30 feet, but the branches are stouter and more open, with broadly ovate, or orbicular-ovate, leaves, which are tomentose on both sepals, and excessively coriaceous. Flower-heads in terminal racemes, similar to those of *O. Colensoi*, but still darker in colour. The involucral leaves are arranged in from five to eight series; white, with appressed tomentum. Hab., The Snares, Auckland Islands. Although this plant closely approaches *O. Colensoi* in most particulars, its general appearance is very different, owing to its more open habit, more spreading branches, and profuse tomentum. This, however, disappears from the upper surface of the leaves during their first winter.

C.—PEDUNCLES TERMINAL, NAKED.

8. *O. insignis*, Hook. f., *Fl. N. Z.*, ii., 331. A robust species, of spreading habit, and great beauty, usually 1 to 3 feet high, with oblong or ovate quite entire leaves, crowded near the tips of the branches. Leaves green, glossy above, white beneath, excessively coriaceous; flower-heads on naked peduncles, 6 to 12 inches long, as thick as a goosequill, white, with appressed pubescens, heads 1 to $2\frac{1}{2}$ inches in diameter, with many series of tomentose involucral leaves; ray florets narrow, white, disc yellow. Hab., South Island, Amuri to Kaikoura, sea level to 4000 feet.

The leaves of this handsome species are occasionally 7 inches in length; it is the only species with entire leaves belonging to this section. Two or three leafy bracts are occasionally developed on the peduncle. The large globose flower-heads are elevated above the foliage, and give this plant an appearance quite unlike that of any other. Its nearest allies are two Australian species, *O. grandiflora*, Hook. f., *Is. Pl.*, t. 862, from South Australia; and *O. panuosa*, Hook. f., from South Australia and Victoria. T. Kirk, *F.L.S., Wellington, N.Z.*

THE TRANSPLANTATION OF PORTIONS OF PLANTS.—The question whether the parts of a plant can be made to grow by inserting them in any part of another plant of the same species has recently been investigated by Dr. H. VOCHTING, who, in the *Bot. Zeitung*, iv., p. 815, describes the results of a number of experiments, chiefly on the common Beet. He found that when the transplanted and the receiving organ are the same, the experiments succeeded with any section of root, stem, or leaf—longitudinal, tangential, or radial; and that, under certain conditions, the same holds good when two

organs are different. He concludes from this that there is no organic principle of differentiation between the various organs. The essential condition is that the transplanted portion of tissue must be placed in its normal position; if this is not observed, coalescence of growth may take place, but with various disturbances or distortions; or one part may even exercise a poisonous influence on the other.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending December 2, is furnished from the Meteorological Office:—

"The weather was very changeable, with considerable fluctuations in temperature. Snow fell in Scotland on November 29 and 30, and afterwards extended southwards over the greater part of the United Kingdom.

"The temperature differed very little from the normal. The highest readings were observed mainly on November 28, when the thermometer exceeded 55° in all districts, excepting 'England, S. and S.W.' and the 'Channel Islands.' In 'Scotland, N. and E.' the absolute maximum was as high as 59°. The lowest readings occurred in 'Scotland,' mostly on December 1; but, over 'England and Ireland,' on December 2, the thermometer on one or other of these dates falling to 20° or less in all districts, excepting 'Ireland, N.' and the 'Channel Islands.' In 'Scotland' the absolute minima ranged between 12° and 15°.

"The rainfall amounted to less than the mean in all districts, excepting 'Scotland, N. and England, E.' the deficit being in many places very considerable. In 'Scotland, N.' however, the total amount was as much as three times the normal, the excess being due chiefly to some exceedingly heavy falls, which occurred in the western parts of the district. At Glencarron the total for the week was no less than 10 9 inches.

"The bright sunshine was in excess of the mean in

all districts, excepting 'Scotland, N.,' and 'England, E. and S.' The percentage of the possible duration ranged from 12 in 'Scotland, N.,' and 18 in 'England, E.,' to 29 in 'Scotland, W.' and 'Ireland, N.'

MARKETS.

COVENT GARDEN, December 7.

We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day, Ed.]

PRICES rule as last week.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with columns for flower types (e.g., Arum, Bouvardias, Camellias) and their prices per dozen or bunch. Includes prices for Narcissus, Orchids, and Pelargoniums.

ORCHID-BLOOM in variety.

CHRYSANTHEMUM-BLOOM very plentiful, price is low in consequence.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table listing prices for various plants in pots such as Adiantum, Aspidistra, Chrysanthemums, Cyperus, Dracæna, Erica, Evergreen Shrubs, Ferns, and Solanums.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table listing prices for Apples, Cobs, and Grapes per bush, 100 lb., and per lb.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table listing prices for various vegetables including Beans, Beet, Carrots, Cauliflowers, Celery, Cucumbers, Endive, Herbs, and Leeks.

POTATOS.

The prices during the past week have been firm for best samples only. Lower prices have been taken in most instances for inferior samples and qualities. Prices for best kinds, 70s. to 100s.; and for ordinary, 35s. to 65s. J. B. Thomas.

SEEDS.

LONDON: Dec. 6.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that this being Cattle Show week the seed market has been well attended. This morning's cables from America report a further advance in Clover seed of 1s. per cwt. Choice samples of new English Red are somewhat scarce and excite increased attention. There is no change in either Alsike White or Trefoil. Rye grasses neglected. Canary seed, with a strong undertone, has risen another 2s. Hemp seed keeps cheap. More money is asked for Rape seed. Mustard is steady. Peas and Haricots unchanged. Canadian Linseed very firm.

FRUITS AND VEGETABLES.

BOROUGH: December 8.—Quotations:—Savoys, 4s. to 6s.; Cauliflowers, 4s. 6d. to 6s. per tally; Turnips, 1s. to 1s. 6d.; Carrots, 2s. to 3s.; Parsley, 2s. to 2s. 3d. per dozen bunches; Onions, 5s. 6d. to 6s. 6d. per bag; English, do., 6s. 6d. to 7s. per cwt.; Apples, 1s. 3d. to 6s. per bushel.

STRATFORD: Dec. 5.—Quotations:—There has been an excellent supply of all kinds of produce at this market during the past week, and a good trade was done at the undermentioned quotations:—Cabbages, 1s. to 3s. 6d. per tally; Savoys, 2s. to

5s. do.; Greens, 6d. to 1s. 3d. per bag; do. 1s. to 1s. 9d. per dozen; Cauliflowers, 8d. to 1s. 6d. per dozen; do., 2s. 6d. to 6s. 6d. per tally; Brussels Sprouts, 1s. 3d. to 1s. 6d. per half-sieve; do. 2s. to 2s. 6d. per bushel; Celery, 6d. to 1s. per roll; Horseradish, 1s. 3d. to 1s. 6d. per bundle; Turnips, 1s. 3d. to 1s. 6d. per dozen bunches; do., 20s. to 35s. per ton; Carrots, household, 40s. to 5s. do.; do., cattle-feeding, 28s. to 36s. per ton; Parsnips, 8d. to 1s. per score; Mangels, 13s. to 25s. per ton; Swedes, 20s. to 26s. per ton; Onions, English, 150s. to 18s. do.; do., Dutch, 6s. to 6s. 6d. per bag; do., American, 6s. to 7s. per case; Apples, English, 2s. to 5s. 6d. per bushel.

FARRINGTON: Dec. 7.—Quotations: Celery, 8s. per dozen; Horseradish, 1s. 3d. per bundle; Carrots, 2s. 6d. per dozen bunches; Onions, English, £7 10s. per ton; case, do., 6s. 6d. per case; Sprouts, 1s. 3d. per half-bushel; Turnips, 1s. 6d. per cwt.; Chestnuts, 7s. per bag of 50 kilos; Apples, cooking 1s. per bushel; Bleuheims, 7s. do.; Grapes, English, 1s. 3d. per lb.; barrels, 11s. each.

POTATOS.

BOROUGH AND SPITALFIELDS: December 5.—Prices ranged from 35s. to 100s. per ton.

STRATFORD: Dec. 5.—Quotations:—Magnums, dark-soil, 35s. to 42s.; do., light, 40s. to 60s.; Imperators, 40s. to 60s.; Hebrons, 53s. to 70s.; Scotch Magnums, 50s. to 70s. per ton.

FARRINGTON: Dec. 7.—Quotations:—Hebrons, 50s. to 10s.; Snowdrops, 60s. to 80s.; Main Crop, 60s. to 80s.; Regents, 50s. to 70s.; Magnums, 49s. to 60s.; Blackland do., 40s. to 50s. per ton.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 140s. to 150s.; new, do., 125s. to 145s.; inferior, do., 100s. to 120s.; Hay, best, 145s. to 170s.; inferior, do., 90s. to 100s.; new Mixture, 115s. to 130s.; and Straw, 35s. to 58s. per load.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending December 2, and for the corresponding period in last year:—1893: Wheat, 27s.; Barley, 28s. 8d.; Oats, 18s. 5d. 1892: Wheat, 27s.; Barley, 28s. 5d.; Oats, 17s. 2d.

ENQUIRIES.

"He that questioneth much shall learn much."—Bacon.

BELGIAN ORCHID GROWERS' COMPOST.—Will some correspondent kindly afford "W.H.B." a description of the above?

WILLOWS FOR BASKET WORK.—"A Canadian Friend" desires the following information: In what condition are Willows placed upon the market by growers? What price is usually obtained? What varieties and sizes are most in demand? Is the market generally fully supplied?

OUR ALMANACK.—Secretaries of Societies and others, are earnestly requested to forward immediately, the dates of Show Fairs and Meetings of Botanical and Horticultural Societies of any kind for 1894, for insertion in the Almanack, to be published in our issue for January 6.

ADDRESSES OF FRENCH RAISERS OF ROSES: W. H. H. Ducher Frères, Chemin de Quarter Maisons; Levet, Route d'Heyrien Mont Plaisir, 73; Guillot, J. B., Grand Rae de la Croix Rousse. All of the above are in Lyons.

ACCEA: Acne.—The old variegated form is, so far as we know, always female, but there is no reason why we should not get a blotched-leaved male. The green-leaved form you send has male flowers, but some of the green forms are female.

CELOGYNE BAROSTA: W., Stratham Common. The plant is best accommodated in the cool Orchid-house, and requires a plentiful supply of moisture. The plant is not like C. cristata, in that the flowers do not damp-off if not afforded more warmth than that of the cool-house when pushing them forth.

COVERT FOR RABBITS, TO CONSIST OF PLANTS THAT THE ANIMAL WILL NOT GNAW: Planter. Rhododendron ponticum, common Laurel, Portugal Laurel, common or other, Privet, Berberis vulgaris, Berberis aquifolium, Snowberry, Cornus sanguinea, C. Mas. Most of the above grow fast.

GRAPES FOR UNHEATED HOUSE, AND PEARS, PLUMS, FOR AN EAST WALL: A. F. Black Hamburg is the best Grape for the purpose, then come Foster's Seedling and Royal Muscadine. The Pears may consist of Jargonelle, Williams' Bon Chrétien, Beurré Giffard, B. d'Amanlis, Madame Treuye, Beurré Hardy, Thompson's Seckle, Marie Louise, Conseiller de la Cour, Beurré Bosc, Brockworth Park, Gloa Morceau, Doyenné du Comice, Beurré d'Anjou, Chaumontel, General Todtleben, Monarch, Bergamotte d'Espereu, Easter Beurré and Doyenné d'Alençon. Plums, dessert, Grand Duke, Monarch, The Czar, Angelina Burdett, Coe's Golden Drop, Kirke's, Bryanstone Gage, and Reine Claude de Bavay. These ripen in the order given, as also do the Pears. If culinary Plums are required, choose Early Rivers, Belle Louvaine, Deubigh, Diamond, Mirabelle, Pond's Seedling, Victoria, and Automne Compôte.

GRAPES SHANKING: K. H. H. We should take it that overcropping is in this case the cause of the shanking, especially as the fruit has lost colour. Examine the border as to the drainage and condition generally. We cannot repeat all that has been written on this subject in the Gardeners' Chronicle. See correspondence on the subject in the present issue.

LEAF-MOULD AND VINES: C. M. This substance, even when it is thoroughly decayed, which the sample sent is not, is not good for Vines, young or old. The sample must have been placed near the roots in large quantities, and when only in a state of partial decay, and having been insufficiently moistened, it did not thoroughly decay, hence the growth of fungus, and the consequent destruction of the finer roots. Clear it out, and replant the Vines in sound loam, with 1/2 gal. of crushed bones, 1/2 gal. of old plaster, and a sprinkling of Vine-manure to each barrowload of soil. Young Vines are best planted when in a growing state—say, in the months of April, May, or even later.

LEEDS MARKET AND LONDON MARKET CABBAGES: Customs. We believe these varieties are quite distinct. One Leeds Market variety is the Ox-heart.

NAMES OF FRUITS: I. S. 1, Gansel's Bergamot; 2, Marie Louise; 3, Josephine de Malines.—J. Warren. We do not know the Apples you send us; they seem to be strangers.

NAMES OF PLANTS: W. K. B. It is very difficult, and in many cases impossible, to identify Conifers from small scraps:—A, a Juniper, probably J. virginiana; B, probably a form of Juniperus virginiana; C, probably Juniperus sinensis; D, a form of Thuia (Biota) orientalis; E, probably a seedling form of Thuia occidentalis; F, probably a form of Thuia occidentalis.—W. S. Maxillaria picta.—D. Agrostemma coronaria, so far as we can tell from an unflowered specimen.—W. J. 1, Blechnum brasiliense; 2, Asplenium australasicum; 3, Aspidium coriaceum; 4, Polypodium appendiculatum; 5, Davallia Tyermanni; 6, Nephrolepis exaltata.—Subscriber, 1, Abutilon vexillarium variegatum; 2, Anthericum lineare variegata; 3, Dracæna rubra; 4, D. amabilis; 5, Begonia metallica; 6, Abutilon Sellowianum marmoratum; 7, Begonia Ingrami.

PEACH-HOUSE: Planter. No fruit trees would do any good on the back-wall with Peach trees covering the roof. You might plant Maréchal Niel or W. Alan Richardson Roses. These would flower early before the trees shaded them very much. Camellias would succeed, and perhaps Lapagerias. If you could put the Peach trees on a trellis 3 or 4 feet from the roof, "rider" Peach trees, that is, trees with a tall stem, would answer very well on the wall. It is too shady for Tomatos as at present arranged; although they also would answer if the front trees were placed lower.

PEACHES FOR FORCING: Sunbury. We give the following in the order of their ripening:—Early Beatrice, small, good, July 6; Early Rivers, large, delicious, July 18; Early Silver should be put in a warm part of the house, large, rich, coming in early August; Condor, August, medium size, piquant, good; A'bec, good, August; Grosse Mig-

nonne, fine Peach, September; Belle Bauce, fine, end of August; some fine late varieties are Princess of Wales, Sea Eagle, Golden Eagle, Gladstone.

POINSETTIA FULCHERRIMA LOSING ITS LEAVES AND BRACTS: *W. C.* If it be not due to a sudden fall of temperature, or watering them with water near the freezing point, we are unable to account for the mishap; the roots and stem being healthy.

PRIMULA FORBENI: *K. L. D.* It is described as monocarpic, that is, that it dies after flowering and producing seed, so that its life may extend over more than one year.

PYRUS JAPONICA FRUIT, AND THE BERRIES OF THE WINTER CHERRY: *S. C. C.* The fruits of the former if they can be obtained in a mature state—and that may not be difficult this year, may be allowed to get bletted like the Medlar, in which state they make a very nice jelly, or a jam. The berries of the Winter Cherry, are liked in the raw state by some persons, and are commonly so eaten in France. When the envelope is slit and turned back, exposing the scarlet fruit inside, they form pretty winter ornaments for filling vases if cut with long stalks.

RAPE AND CRESS: *A. B. C.* It is usual to grow these saladings on sloping banks of soil in houses heated up to 60° by night, and a little higher by day, with but small ventilation afforded. It does in forcing-houses, in vineries with the roots of the vines in outside borders only, the bank of soil being thrown up from the front to the back. The surface soil should be moderately good, and when it consists of pure leaf mould, but little grit is found in the plants when cut in the seed-leaf stage.

TO GET RID OF RABBITS: *G. Cadbury.* Put several ferrets, smeared with petroleum, into the rabbit-holes. This will have the effect of clearing out the rabbits for a time, and after this is done, stop the holes with sods; and with terriers and guns clear the rabbits out of their hiding-places in the bushes. The ferrets should be smeared several times, and if a ferret kill, and become thereby lazy, put a fresh one into the holes. You cannot use a line with them, but a bell tied on the neck is useful in finding a ferret if "laid up." Badly-infested land cannot be cleared of the animals at one attempt. We cannot recommend the use of poison in this country.

TUBER: *W. J. B.* A tuber of a Chirita or other Gesnerad, but we cannot say which species, unless flowers and leaves could be sent.

WATER AT 80° TO 85° FOR PEACH TREES: *H. H.* It is good practice to syringe forced trees with warm water, and although the water in the water-can might be 80° to 85°, when it reached the trees it would be several degrees below these figures; so also with water as warm only as the air of the forcing-house. Water of 80° is not absolutely needed, but its use at this season hastens the starting of growth, and cannot do harm. Mr. Temple knows what he is about.

WATFORD SHOW: *W. G.* We do not profess to report every show, nor to record everything which is shown. The space at our disposal would not permit it to be done. But we select only the more important exhibitions and the principal features of the exhibition.

COMMUNICATIONS RECEIVED.—T. H. C. (with thanks).—H. H. D'O.—W. R. B.—A. H. C. (with thanks).—W. H. W.—C. W. B.—Haage & Schmidt, Erfurt.—D. R.—G. Callender.—S. S.—R. H. Vertegans & Co.—W. J. B.—K. L. FRUIT SENT FOR NAMES.—K. H. H. & Co., next week.

CONTINUED INCREASE in the CIRCULATION of the "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

Increased to the extent of 75 per cent.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

THIS GREENHOUSE erected and heated complete, in any part of the country, best materials only, workmanship guaranteed, 25 ft. by 12 ft., £50; 30 ft. by 15 ft., £70. Brick-work excepted. For particulars, see our Catalogue, post-free.

Superior Portable Frames, large stock ready for immediate use, well made, painted four coats, glazed with 21-oz. glass, carriage paid:—1-light frame, 4 x 6, 36s. 6d.; 2-light frame, 6 x 8, 58s.; 3-light frame, 12 x 6, 85s. 6d. **Span-roof Frames**, 9 x 5, £3 15s.; 12 x 6, £5; 16 x 6, £7 10s. Can send off same day as ordered.

HARDY BRUIN & CO., Graham Street, LEICESTER

Patronised by 20,000 of the Nobility, Gentry, and Clergy, for all kinds of **OUTDOOR WORK, CONSERVATORIES, Greenhouses, Frames, &c.** 1 Cwt., and Oil Mixture, Free to all Stations. Liquid Non-Poisonous Paint for Inside of Conservatories, &c. Prices, Patterns, and Testimonials, Post-free. **GROVE WORKS, LOMBARD ROAD, BATTERSEA, LONDON, S.W.;** and BACHELOR'S WALK, DUBLIN.

To Nurseries and Gardeners.
WANTED, the above, to try **SPENCER'S NEW ELECTRA GUANO.** Prize Growers of Flowers and Vegetables will find this the most powerful yet harmless Fertiliser yet introduced. Sample cwt. bag, 20s. carriage paid. Analyst's report with each parcel. Agents wanted in districts not yet represented. First-class men will be honestly and liberally dealt with. Apply, I. SPENCER, 54, Spring Street, Hull.

C. BEESON'S MANURE.—Composed of Blood and Bone, The Best Fertiliser for all purposes. Sold in tins, 1s., 2s. 6d., and 5s. 6d.; also in air-tight bags, 1/2 cwt., 6s.; 1 cwt., 10s. Full directions for use sent with each tin and bag. 1 cwt. and above sent carriage paid, cash with order. **C. BEESON, Bone Mills, St. Neots, Hunts.**

"I have tried this fertiliser on various garden crops, and I am able to say that it is an excellent Manure for Vegetables, Flowers, Vines, and Fruit Trees."
"A. B. GRIFFITHS, Ph.D., F.R.S.E., F.C.S."

STANDEN'S MANURE

(Established 30 years).

The fertilising properties of this Manure are acknowledged to be unsurpassed by any in the market. If used carefully, in small quantities, most satisfactory and lasting results will follow.

Analysis produced to purchasers of any quantity on application.

Sold in new and enlarged Tins, 1s., 2s. 6d., and 5s. 6d. each; and in Wooden Kegs, 28 lb., 10s. 6d. 56 lb., 18s.; 112 lb., 32s. each.

TO BE HAD OF ANY SEEDSMAN.

CHARLES P. KINNELL & CO.,

IRONFOUNDERS, ENGINEERS, and BOILER-MAKERS.

ROCHFORD HORIZONTAL TUBULAR BOILER,

BOLTING TOGETHER WITH INDIA-RUBBER RING-JOINT,
MANUFACTURED WITH FLOW AND RETURN
SOCKETS IN ANY POSITION.

This Boiler has special advantages over any other of this type manufactured; the configuration of the centre casting divides the top connecting-pipe into two sections, gives increased waterway, and is removable without taking off back casting. No other Boiler has this a vantage.

TERMINAL END AND CHAMBERED
SADDLE BOILER.

VERY HIGHLY RECOMMENDED.

This Boiler is of the IMPROVED SADDLE FORM, is manufactured in Wrought Iron, welded; the back waterway, against which full force of the fire strikes, and the centre flue, make this one of the most economical Boilers extant. Made in all sizes, from 24 to 72 in. long.

CAST-IRON
SADDLE BOILER,

WITH WATER-WAY END
and
SIDE-FLUE OPENINGS.

The above is the best of all Boilers of the plain Saddle type. Made in all sizes, from 24 to 66 inches long.

Holding one of the largest stocks of H. W. Boilers, Pipes, and Fittings, in the Kingdom, we are able to execute Orders of any magnitude from London Warehouses, or to despatch direct from Works without delay. To meet the requirements of our increasing business, we have recently added No. 65, Southwark Street to our London premises, and have now the largest and finest Show-rooms in our Trade in the Kingdom. Price List illustrating all types of Boilers, Valves, Pipes, Ventilating Gear, and all classes of Horticultural Appliances free on application.

65 and 65a, SOUTHWARK STREET, LONDON, S.E.; also Branches at GUERNSEY and JERSEY, for CHANNEL ISLANDS.

SILVER MEDAL
HORSE-SHOE BOILER,

The Best and Most Economical
Amateurs' Boiler Manufactured.

Section of Boiler and Pipes, showing action of Hot Blast and Automatic Regulator. Awarded the SILVER MEDAL (FIRST PRIZE) by the Royal Horticultural Society in 1883; still stands without rival for—

Power, Efficiency, and Economy.

Patents 10,398.

GARDENERS AND OTHERS WANTING SITUATIONS.

26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 5s. each insertion.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

SHOPMAN.—Age 32; seventeen years' inti- mate practical knowledge of the Seed Trade in all its branches. Highly recommended.—**LOTHIANS**, Alex. Dickson & Sons, Queen's Seedsmen, Belfast.

SHOPMAN.—Twelve years' experience. Good knowledge of Seeds, Plants, and Nursery Stock. Good references.—**J. H.**, Messrs. Bird & Vallance, Downham Market.

TO FLORISTS.—A young Man desires engagement in a Florist's Shop; well up in Furnishing and General Routine of the Business.—**FLORIST**, 31, University Street, W.C.

ANOTHER RUINOUS ADVANCE IN THE PRICE OF COALS, was for some time the favorite mode of greeting between anxious householders, who entertained grave forebodings that fires would soon be a forbidden luxury. The best way, however, in which we can prepare to meet the rigours of the rapidly-advancing winter, is to have a good supply of Holloway's Pills and Ointment to quicken the circulation, cleanse the system, and enable it to withstand the various ailments incidental to cold or wet weather. The coal famine is now a past misery; but when once disease gets a firm hold of us, there is no telling how severe the consequences may be. Holloway's remedies are a sure safeguard for both old and young.

In reply to numerous enquiries why I do not have an Annual Clearance Sale. The reason is because my Greenhouse Timber is cut from 1st QUALITY ONLY, leaving No Rubbish to dispose of at the end of the season.

I respectfully advise a visit of Inspection before purchasing elsewhere as lowest prices are not always cheapest

W. DUNCAN TUCKER.

Price 5s., post free, 5s. 6d.

A. F. BARRON, Royal Horticultural Society, Chiswick.

NEW CHRYSANTHEMUM for 1894.

"ROYAL WINDSOR."

A Japanese variety, of a very dwarf and robust habit, the
 plants being well furnished with exceptionally large, dark-
 green foliage of an extraordinary texture. The flowers are
 large, and of a good form and substance; when expanding
 they are of a beautiful rosy-chestnut and gold, opening out
 until the outer petals become a light primrose colour, with the
 centre of a pleasing deep orange-yellow, shaded with bronze.
 Acknowledged by all who have seen it to be a gem.

Plants ready for distribution in January, 1894. To be had
 of all the leading Chrysanthemum Growers.

Price, 5s. each, three for 10s. 6d., six for 21s.

JOHN SMITH, St. Leonard's Road Nursery, Windsor, Berks.

 of testimonials. Per bushel, 5s.
 R. AND G. CUTHBERT, Seed, Bulb, and Plant Merchant,
 Southgate, N. Established 1879.

FOR SALE, 10,000 three-times transplanted
 SCOTCH FIRS, 4 to 12 feet, well-furnished; half price.
 Also grand CHRISTMAS TREES.
 E. TANNER, Nurseryman, Groombridge, Sussex.

EARLY TOMATO PLANTS.—Hackwood
 Park Improved. Most reliable for early planting. Strong,
 sturdy plants. On and after January 1 next, 2s. 6d. per
 dozen, carefully packed and forwarded, carriage free, to any
 part of the United Kingdom, for cash with order.
 HEAD GARDENER, Dashwood, Gravesend, Kent.

LARCH STAKES for SALE.—A large
 quantity of Larch Stakes for Sale cheap. Suitable for
 supporting young trees; 5 to 6½ feet long by 3 to 4 inches
 diameter in the middle. For price, &c., apply to
 ROWLAND BROS., Timber Merchants, Bletchley.

FOR SALE: 6 *Encharis amazonica*, in 16-size
 pots; 16 *Panicum fragrans*, in 32's; 26 *Calanthe
 Veitchii*, 7 *C. vesita lutea*, 2 *C. Turnerii*, 20 *Crotons*, various;
 20 *Draecena Cooperii*, 4 *Hibiscus flore pleno*, 1 *H. lutea plena*,
 1 *H. Schizopetalus*, 2 *Allamanda Hendersonii*, 4 *Clerodendron
 fallax*, 6 *Caladium argyrites*, 6 *C. minus rubescens*, 10 *Caladi-
 um flexuosum*, 6 *Azaleas*, in 16-size pots, in good bud; 4 *Ou-
 cidium varicosum*, 2 *Cattleya Triane*, 2 *C. Mossie*, 2 *C. Men-
 delii*, 1 *Chysis bracteosa*, 3 *Dendrobium speciosum*, 1 *D. Dal-
 housianum*, 3 *D. fimbriatum oculatum*, 1 *D. chrysoctonum*,
 1 *D. thyrsiflorum*, 1 *Angraecum sesquipedale*, 2 pots of *Phaius
 grandifolius*, showing 12 spikes; 1 *Oncidium Wentworthianum*,
 and 1 *O. varicosum*. These plants are all clean and healthy
 stuff. Apply to—
 R. H. BROWN, Capel Manor, Horshamden, Kent.

FOR ORCHIDS and GARDENERS
to Grow Them, apply to **SANDER'S**, St. Albans. The finest stock of Orchids in the World.—30 minutes from St. Pancras.

LARGE SHRUBS, &c.—American Arbor-vitæ, 3 to 3½ ft., 20s. per 100; Azara microphylla, 3 ft., 4s. per doz.; Azalea pontica, 2 ft., 4s. per doz.; Berberis aquifolia, 1½ to 2 ft., 12s. per 100; B. Jamesonii, 2 ft., 16s. per 100; Cotonæster microphylla, 2 ft., 16s. per 100; C. Simonsii, 2 to 3 ft., 16s. per 100; Escallonia macrantha, 2 ft., pots, 30s. per 100; Pampas Grass, 2½ ft., extra, 30s. per 100; Griselinia littoralis, 15 to 18 in., 6s. per doz.; Laurel Colchic, 2 to 2½ ft., 11s. per 100; L. Portugal, 2 ft., 20s. per 100; Lilacs, White and Purple, 2 ft., 6s. per doz.; Laurestinus, 15 in., 6s. per doz.; Olearia Hastii, 2½ ft., 4s. per doz.; Rhododendron ponticum, 1½ to 2 ft., 25s. per 100; 2 to 2½ ft., 35s. per 100; 3 to 3½ ft., 50s. per 100; Veronica traversii, 15 in., 20s. per 100.

GARLIES MITCHELL, Nurseryman, Strauraer.

LONDON PLANES.—Very fine, good stems, splendid roots, 8 to 10 feet, 2s.; 10 to 12 feet, 2s.; 12 to 14 feet, 4s.; 14 to 16 feet, 5s.; 16 to 18 feet, 6s.; 18 to 20 feet, 7s. 6d. each.

LOMBARDY POPLARS, 12 to 15 feet, 1s. 6d.; 15 to 18 feet, 2s.; 18 to 20 feet, 2s. 6d. each.

Dear Sirs,—It affords me much pleasure to inform you the 25 ft. Annual Sun Windmill, on 40 feet timbers, working a set of 3 in. x 9 in. stroke treble pumps, that you fixed here for Baron Schröder, is giving very great satisfaction, pumping the water through 4,224 feet of pipe, to a vertical height of about 80 feet. I must also express my thorough appreciation of the manner in which the whole of the work has been so successfully carried out.—Yours faithfully,
H. BALLANTINE, Head Gardener to Baron Schröder.

THE RECENT STORM IN SCOTLAND.

THE storm of the night of the 17th and morning of the 18th November last, will be long remembered in the north of Scotland as the most destructive of the century. The storm of December, 1879, which brought down the Tay Bridge, did comparatively little damage in the north, the storm-centre passing more over the midland Scotch counties, while the north appeared only to feel the force of the fringe of the storm. The recent storm was accompanied generally by heavy rain, and with sleet and snow on the higher districts. The ground being sodden with wet, while the tops of Scotch Firs were weighted by wet and snow, the conditions were the worst possible for resisting the impact of a destructive gale. All over the woods the storm has left traces of its destructive force; but it was only in places that the destruction was complete or nearly so. Where the wind swept across a great extent of moorland country, and on nearing the coast came down a glen, or strath, or between two hills or ridges, the destructive force of the wind was terrific. In some instances it laid low acres of trees on a hillside; in others it cut a track 80 to 100 yards wide through a wood, levelling nearly everything before it. At Clynelish, Gordonhush, Uppat, Ben Braggie, The Mound, and some other places in Sutherlandshire, fine old Scotch Fir woods have been uprooted and practically wiped out. The wreck in these storm-tracks must be seen to form an adequate idea of the damage done. Most of the trees have brought up tons of soil and roots. Hundreds of trees from 2 to 2½ feet diameter, with 30 to 40 feet clear stem, and from 60 to 80 feet high, have been toppled over like houses of cards. Some of the old trees have snapped off at the surface of the soil, others have broken halfway up—the bare stems standing like broken masts against the sky. In some places the trees are lying three and four deep.

Round Uppat House, about 3 miles from Dunrobin, there is a complete chaos of wrecked timber. Immediately round Dunrobin Castle the damage among the old trees is comparatively slight. One of the storm tracks passed through a fine plantation between the Castle and Flagstaff-lodge. A bolt, or gust, had concentrated its force on a space of 80 to 100 yards wide on the north side of the plantation, clearing a way for itself right through to the south side, a wreck of broken and uprooted trees.

The total ruin left in the track of the storm where the wind had concentrated its force, in places a considerable distance apart, makes one feel thankful that these destructive gusts were

FRUIT TREES.

To MARKET and PRIVATE GROWERS.

We hold an extensive Stock of all kinds of the above, in first-rate quality and at reasonable prices. Intending Planters would do well to send for Descriptive Catalogue free on application.

S. SPOONER & SONS,
HOUNSLOW NURSERIES, MIDDLESEX.

partial, and that after all things the damage done might have been worse.

Although there are wide gaps in the woods in some localities, yet so much of the wood has been left, that the appearance of the landscape will be but little altered. From Dunrobin Castle, fortunately, little damage is seen. A good many old hard-wood trees are down all through the woods in single trees, and groups of from two or three to a dozen. But it is noticeable that the younger hard-wood trees, planted within the last forty or fifty years, have suffered comparatively little damage. The work of getting out the fallen timber amidst such masses of roots, and apparently inextricable confusion, must be both tedious and laborious, and the enormous quantity of timber down at once will be a difficult problem to deal with. Fortunately in many cases the trees have roots enough to keep the timber sound for probably two or three years, which, will give time to contractors to clear the ground and dispose of the timber in the markets.

Where large areas of full-grown standing timber are in question, probably but little can be done to minimise the risk of damage by destructive gales. But in the case of young trees, the lesson taught by the recent hurricane may be turned to good account. Young trees, hard-wood particularly, should be gone over every year or two, and judiciously pruned to concentrate the energies of the tree into forming a sturdy well-rooted trunk, with a moderate spread of branches. Competing leaders should be thinned-out to the best-placed one. Where trees in good soil are growing too quickly to height, the leader may sometimes be stopped with advantage for a year or two to bring circumference of stem, height, and root-anchorage more into proportion to each other. Where young trees are properly started in this way, they usually give little trouble after they attain some size, except thinning where standing too closely together.

Old and valued trees, past their prime and declining in vigour and root-hold, prized perhaps for their ancestral associations, and saving holes of perhaps a hundred years' growth, might have their heads carefully reduced where top-heavy. This might be done by shortening long and heavy branches, and judiciously thinning the heads without giving them the appearance of having been pollarded. Better a moderate head, on a fine old trunk, than to court disaster by carrying too much top-weight. A noticeable feature of the recent storm was the comparatively little damage that was done to hedgerow and other trees growing singly, and without shelter by road-sides and round fields, although, in some cases, right in the track of the storm. These trees were mostly hard-wood, and were no doubt, from their exposure, better rooted in the soil and prepared to meet the storm than their fellows in the woods and plantations who had been more crowded and dependent upon each other for mutual shelter.

Timely thinning in the case of coniferous woods and plantations would greatly help the development of trunk and roots of trees to be left for a crop; the cutting of timber when ripe, where grown for estate and commercial purposes; the replanting of young trees more or less as occasion may require each season, so as to have a succession of trees coming on to take their part in the economy of the estate, and the amenity of the landscape, would tend to reduce the risk of losses by great storms. It was sound advice the old Scotch laird gave to

his son:—"Be aye stioikin' in a tree, Jock, it'll be growin' when ye're sleepin'." *D. Melville, Dunrobin Castle Gardens.*

ORCHID NOTES AND GLEANINGS.

CYPRIPEDIUM NIOBE.

This hybrid *Cypripedium* is one of the most beautiful that has been raised, although it may be eclipsed in the future. Hybrid *Cypripediums* are raised in large numbers, but none so fine in form or colour as this acquisition of Mr. Seden's, of Messrs. Veitch & Sons. I recently noticed a plant in bloom in Mr. Wigan's collection at East Sheen. *C. Niobe* first flowered in 1889, and the seed was sown in 1884, five years therefore elapsing before it bloomed. It is the result of *C. Spicerianum* crossed with *C. Fairrieum*, the latter being the pollen-parent. This was a happy selection of parents, as *C. Fairrieum* is a beautiful species, and also *C. Spicerianum*, which is more vigorous. The character of the pollen-parent is, fortunately, well reproduced in the offspring, the petals having the same characteristic curl. The dorsal sepal is large, fully 2 inches across, the rich purple central band reminding one of *C. Spicerianum*, and there are rich stripes or veins of purple, the margin pure white at the upper portion. The lip is pale green, brownish-purple in front. Fortunately, the plant, as far as I have seen it, is free and strong. *V.*

THE ORCHIDS AT HIGHBURY, BIRMINGHAM.

When the Right Hon. Joseph Chamberlain, M.P., reached home after his visit to the United States, a rich display of bloom awaited him on his Orchids, which he never ceases to take great interest in. On the occasion of a recent visit paid to Highbury, there was a bright display of *Cattleya maxima*, *C. labiata* varieties, and others, including *C. aurea*. In the *Cattleya*-house, in which there is a general collection of *Cattleyas* and *Lælias*, several plants of *C. Trianae* and *C. Percivaliana* were in flower. In the next house, which is from 5° to 6° warmer, were *Cattleyas* *Rex* and *El Dorado*, with *Lælia elegans*, and hybrids from these and other species, as well as a number of seedling *Cattleyas* raised here, but which have not reached blooming age.

In another house was a small collection of East Indian Orchids and *Cypripediums*, a fine batch of *Odontoglossum Roezlii*, which grows nowhere so well as in this house. Plants of *Angraecum sesquipedale*, showing fine spikes at that early date; and *A. Sanderianum* and *A. ciliatum*, also showing spikes freely. *Cypripedium Marshallianum* was also showing flower-growths, and some of the type of *C. Sedenii* were in flower. *Phajus tuberosus* is a plant that is well done here.

The show-house was rich with flowering Orchids placed amongst healthy-looking foliage plants. There were *Cattleya labiata* in variety, *Calanthes*, *Barkeria*, extra fine; *Cattleya aurea*, *C. Bowringiana*, *C. maxima*, and others; and in the cool house adjoining were *Odontoglossums*, *Anguloas*, *Oncidiums*, *Adas*, *Cœlogynes*, and other Orchids; and in flower, *Oncidium tigrinum*, *O. Forbesii*, *O. grande*, *O. Alexandræ*, in great variety; *O. Andersonianum*, and others; and a good lot of *Sophronites grandiflora* in suspended pans.

In a house of intermediate temperature was noted a superb batch of *Miltonia vexillaria*, plants of *O. Phalaenopsis*, *O. grande*, and *Lycaste Skinneri*, a quantity of each all showing strongly and freely for bloom. The plants of *Maedevallia tovarensis* were masses of blossoms; and others especially noticeable were *Ornithidium Sophronites*, which flowers freely when allowed to ramble away from the compost. An adjoining house is filled with *Odontoglossums*, and one at the end of the corridor with *Dendrobiums*, which have thriven exceedingly. In this house were many seedlings raised at Highbury as yet unbloomed, the oldest of which are some young plants of *Dendrobium formosum giganteum* × *D. Lowii*.

One house is devoted to *Phalaenopsis*, the plants in excellent condition, and showing freely for flower; with these were species of *Dendrobium*, which require a little warmth during the winter.

Amongst Mexican Orchids in another house is a large number of plants, many of them fine specimens of *Lælia anceps*, and nearly one hundred spikes of the *L. anceps alba* varieties will soon be in bloom. Amongst seedling Orchids remarked in this house were some the result of crossing *Cattleya Harrisoni* with *Sophronites grandiflora*, and *Sobralia macrantha* with *Cattleya gigas*, another singular and interesting cross.

Two other Orchid-houses have been recently added, in which are a number of *Cattleyas*, and several fine basketfuls of *C. gigas* in variety, *C. Warneri*, *Lælia autumnalis* and *albida*.

It is necessary at Highbury to have large quantities of plants in flower at all times, as the demand for Orchid blooms for indoor decoration is a large one. The Orchids of all kinds have made much progress under Mr. Barberry's excellent management. *W. D.*

CATTELEYA LABIATA VERA.

The various importations of the autumn-flowering *Cattleya labiata* have brought a large number of varieties which far exceed in beauty the old plant of that name. Perhaps one of the finest in the country is now flowering in the Rev. R. Kinleside's collection, Sunbury House, Tunbridge Wells. The plant bears five flowers, each 8½ inches across; the labellum is 2½ inches wide, and of that rich crimson-lake colour seen in the best forms of *C. labiata Warneri*. *Cypripedium* × *Morgania*, with three fine spikes; *C. × Niobe*, *C. × Leeanum superbum*, and other rare things are also in flower in the same collection. *J. O'B.*

CYPRIPEDIUM × VENUSTO-SPICERIANUM.

Although not a showy variety, a good form of this hybrid is very neat and pretty. An exceptionally good one, with broad, nearly white petals, thickly spotted with purple, is in flower just now in Mr. H. A. Tracy's Nursery, Amyand Park Road, Twickenham. The same cross is called in some gardens *C. × polystigmaticum*.

CYPRIPEDIUM × IANTHE (HARRISIANUM ♀, VENUSTUM ♂).

For the large size of its flowers, this stately flower stands out prominently among hybrids; the flowers are also of good substance, and the plant a sturdy grower. An excellent example of it, bearing a two-flowered inflorescence, is in flower in the collection of Henry Little, Esq., The Barons, St. Margaret's, where the pretty *C. × Swinburnei*, and a very bright hybrid between *C. Hookeri* and *C. barbatum grandiflorum*, and other rare plants are also in bloom.

ZYGOPETALUM MACKAYII.

The old form of this fine Orchid seems yet to be the best, most of those recently imported being very inferior to it, and some of them scarcely worthy to bear the name. A pair of large specimens of the true old plant, furnished with many spikes of its fragrant and showy flowers, are fine objects in the arrangement of plants in flower put up in the Orchid-house by Mr. J. Dinamore, the gardener at the Cedars, Harrow Weald, the residence of T. F. Blackwell, Esq. *J. O'B.*

KEW NOTES.

LONICERA HILDEBRANDIANA.—This is a new Honey-suckle which was discovered in Upper Burma by General Collett about five years ago, and has lately been introduced by means of seeds to Kew, where there is now a batch of young seedlings. It was described and figured in the *Journal of the Linnean Society*, vol. xxviii. (1891), along with *Rosa gigantea* from the same region. The Honey-suckle has flowers 7 inches long, and large ovate glossy-green leaves. General Collett says of it: "*L. Hildebrandiana* is, so far as I am aware, a rare plant; though I have been told that the flowers of this

species are much used in decorating the temples at Pindiah, near Pwehla. I found it only in one locality, at a season when unfortunately it was almost past flowering . . . It is a conspicuous shrub, with large, dark, glossy leaves and fine crimson flowers, 7 inches long, and by far the largest of any known species of Honeysuckle. It is much to be desired that seeds of this beautiful shrub may yet be secured, and the plant raised for the adornment of our gardens." The flowering of this plant is anticipated with considerable interest.

MUSA HILLII.

This is an Australian species of *Musa*, which was described by Baron Sir F. von Mueller, in his *Fragmenta*, ix., 169, 190. Seeds of it were received at Kew in 1889, and from these the plant was raised which is now flowering for the first time in the Palm-house. It belongs to the *M. sapientum* group, and has a stem 12 feet high by 8 inches in diameter, coloured brown. Mr. Baker gives the dimensions of the stem as 30 feet in height, and $1\frac{1}{2}$ feet in diameter. The leaves are 8 feet long, and $1\frac{1}{2}$ feet wide. The peduncle is thick, erect, a yard long, with whorls of white flowers enclosed in green ovate bracts; the fruits are small and ovoid, and are said to be not edible. The species is wild on the banks of the Daintree river in Queensland. A figure of the Kew plant will be published in the *Botanical Magazine*.

AGAVE POTATORUM.

A large plant of this *Agave* is now pushing up a stout flower-spike at Kew. It is an exceptionally fine specimen, measuring 8 feet in diameter and 5 feet from the collar to the top of the leaves. There are about fifty leaves, each $3\frac{1}{2}$ feet long and a foot wide, narrowed to 6 inches at the base, where it thickens to fully 5 inches; the apex is narrowed to a long horny spine-tipped point, and the margins are armed with hooked spines. This exceeds considerably the dimensions of this species as described by Mr. Baker in his *Amaryllideæ*, where it is stated that *A. potatorum* is a native of Mexico, and was introduced into cultivation about 1830. Possibly this is the first plant to flower in cultivation. It has lately been transferred to the Palm-house, where its spike, which may be 20 feet high, will have room to develop.

OSTEOMELES ANTHYLLIDIFOLIA.

This interesting shrub, which has lately been noted several times in these pages, and is offered in the catalogue of M. Lemoine of Nancy, was found in Upper Burma by General Collett, as is shown by the following note, which follows that on the big Honeysuckle above quoted:—"A very common and conspicuous bush, on certain parts of the plateau, is the curious *Osteomeles anthyllidifolia*, a shrub nearly allied to *Pyrene*, with the habit of the Blackthorn. Thick bushes of it are covered in spring with small, pretty, white flowers, contrasting well with the green, finely-pinnate leaves. It is much browsed by cattle in the neighbourhood of villages, and then assumes a stunted, thick-set habit, reminding one, from a distance, of *Furze* bushes on an English common. Although spread over the whole plateau of the Southern Shan States, it is only common in particular localities, where it sometimes forms extensive thickets." From this it would appear that this shrub is likely to have a value as a hedge-plant in the warmer temperate regions, and also may be worth growing for fodder.

GUEVINA AVELLANA.

This is the Chilean Nut which was introduced in 1878 by Mr. W. Bull, and recommended as an "evergreen tree, 30 feet high, bearing globose edible drupes, enclosing Almond-like seeds, which are eaten in Chili and Peru." It was figured in the *Gardeners' Chronicle* in 1884, vol. xxii., p. 41, from a specimen cultivated out-of-doors in the garden of Mr. Bolitho, at Greenway, near Dartmouth, where it proved to be quite hardy. A leaf from the same plant has lately been sent to Kew by Mr. R. V. Sherring, who informs me that it is now 7 feet high, and perfectly

healthy. The leaves are glossy-green, bipinnate, the pinnæ leathery, ovate, toothed, and the stalks clothed with a rusty tomentum. When small, the plant produces only pinnate leaves. It is also known in gardens as *Quadria heterophylla*. There is only this one species of *Guevina*, which is a Protead, and closely allied to the tropical genus *Rhopala*. Gay, in his *Flora Chilensis*, says that this plant is common in South Chili from 35° to 43° latitude, and that its edible fruits are collected and sent to the north and Peru. The Nuts are called *Avellano* by the Spaniards. This is a plant which might be grown for its ornamental foliage in the warmer parts of these islands, whilst in such places as Florida, the South of France, &c., its cultivation might possibly be made a source of profit. *W. W.*

FORESTRY.

BRITISH FORESTRY: THINNING.

THE article in a recent number of the *Gardeners' Chronicle*, by Mr. A. C. Forbes, on thinning plantations, and another on the same topic, by Mr. Thomson, of Clovenfords, in *The Timber Trader's Journal*, are useful as showing the cleavage, in British Forestry practice, that has got to be closed up before we can have anything worthy of the name of a "system" in this country. Mr. W. T. Thiselton Dyer, of Kew, in his evidence before the "Select Committee on Forestry" a few years since, lamented this cleavage, and referred to the "diametrical" difference of opinion on the same points between Sir Charles Strickland and Mr. Michie in the *Gardeners' Chronicle* some years back, as an example, and as showing in what "a very unsatisfactory state woodland practice was in this country." See Reports, August 5, 1885.

Mr. Forbes, it is easy to see, leans to the continental school, which is the best. Briefly, this school may be said to advocate "close rank" in young plantations till they acquire age, when "close canopy" is the term used to denote the same thing. The object of this close system of growing timber is to shut out light and air from the trunks of the trees, and from the soil, thereby preventing fluctuations of temperature and moisture, excessive evaporation, &c., with the result that the trees, while preserving a sufficient head of branches or leaf-surface to sustain growth, naturally begin to shed their bottom branches at an early stage and continue to do so till the end, when the product is a crop of long, straight trunks free from knots long since grown over. Dr. Schlich, of Cooper's Hill, belongs to this school. So, I believe, does Dr. Somerville, lecturer on forestry at Durham University; and so does Col. Bailey, lecturer to the forestry classes at Edinburgh, and who has adopted *Schlich's Manual* as his standard. Now, if any of your readers interested in this subject will compare *Schlich's* quantities of trees to the acre, especially in the young stage, with the "orthodox" rule-of-thumb tables of British authors, they will be struck with the difference; for the Continental woods by comparison with ours are simply crowded to excess. So particular are they, says Dr. Somerville, that rather than break the continuity of shade and close rank in young plantations, when removing a tree they will ring it, and let it die out. Mr. William Thomson condemns this mode of culture, if we understand him correctly. He travels often, he states, for hundreds of miles in Perth, Inverness, and Ross-shires, and is forced to the conclusion that in the journey he does not pass half-a-dozen well-managed young plantations (a wide term). The mismanagement, he explains, consists in keeping out the light and air by not thinning, from which cause the trees lose their lower branches, exactly the aim of the continental forester within correct limits, and the object now taught by Colonel Bailey to young Scotch foresters. Mr. Thomson assumes that, in the cases he cites, when thinning is done, the trees will suffer after being so coddled, but there is not the least fear of that if the thinning is so conducted that close rank is still maintained.

I have several times been over a good portion of the ground referred to by Mr. Thomson, and my impression was that the Fir woods were thinned, as a rule, too severely, and that the timber was rough in consequence.

Nothing teaches a forester his business like having to sell his productions in the open market. In not such a very long period I have sold by tender, private bargain, and by auction between thirty and forty thousand pounds' worth of home-grown timber for all sorts of purposes, and I have learned by experience what "quality" in timber means, and where the value comes in. It is a constant remark of timber merchants, who know nothing of forestry, that, with the exception of Larch, home-grown timber is either too short in the trunk or too rough, or both, and I am often asked why the trees are not clean and straight, "like the foreign stuff." The difference in the price tells its own tale. You can always get a very much higher price for a good plantation-grown Oak or Ash, for example, than you can for a park or hedge-row tree of the same dimensions, because in the latter the trunk is short and rough, and perhaps more than half the bulk is in the wide-spreading top of limbs and branches—of little more than cordwood value. So with Spruce and Fir timber of any kind. Your customer will give a good deal per foot more to you if you can show him a wood where all the lower branches have long since perished for want of light and air, and the trees have nothing but a "bonnet" at their tops. The least valuable plantations I have seen of Spruce or Scotch Fir and Douglas Fir were what have hitherto been considered "properly thinned" examples, and their low value was due to the fact that they contained too few trees to the acre, and the trees were too rough through being furnished with branches down to the ground (thanks to the "light-and-air" theory), and which ought long before to have been smothered off by close rank. A foreign-grown Spruce and a home-grown one—say, from a Scotch wood well thinned—make clear at once the difference in the two systems of culture. The Scotch Spruce tapers rapidly, and is extremely rough in knots from end to end—a bad fault. The reason of both is too thin planting, and too free thinning afterwards, causing an over production of side branches too far down the tree. The foreign Spruce pole, on the other hand, from woods where they appear to be absolutely crushed, is smooth externally, as if, almost, it had been planed, and is so uniform in girth, that in a pole—say, 40 feet long and quarter girthing perhaps 7 inches in the middle—the run-off from base to small end will often not exceed $1\frac{1}{2}$ inch in the diameter. The Scotch tree will contain the most timber—not much more, but of less value; but the foreign pole more than gains this in quality, and the decidedly greater number of trees to the acre makes up all differences and more.

If I were going to give a young forester a lesson on timber-growing, I would first send him to Grimsby or Liverpool timber-wharves, and next set him to make a bonfire of most of the writings of our British authors on the subject. Mr. Thomson, like a good many others, implies that foresters are handicapped for want of sufficient means, while others say they are not allowed to do this and that by their employers; but I feel sure that, however much to blame landlords may be, they are not to blame for the methods of culture adopted by foresters who, for the most part, have a free hand in that respect, their employers entirely trusting them. The proof, if any were wanted, exists in the teachings of foresters, which show what they would do if they could, and what they do practise when allowed, with the worst results. *S., The Woods.*

WELLS PALACE.

THE city of Wells is beautifully situated on the southern declivity of the Mendip Hills, and contains within its precincts the most magnificent and extensive examples of early English architecture to be found in the west of England.

The Palace, the official residence of the Bishop of Bath and Wells, adjoins the cathedral, and forms one of the principal attractions of the city. It was originally built by Joceline de Welles between 1205 and 1244 A. D.

It is surrounded by a strong embattled wall, having bastions and turrets at intervals, with the usual alure at the top of the wall behind the parapet, in which there are embrasures and loopholes alternately. A wide moat, said to be the most perfect in England, supplied from the never-failing springs which rise in the garden, encompasses the wall, and imparts to the whole the appearance of an ancient baronial residence. The entrance is on the north side, over a fixed wooden bridge; the gate is quaint and massive. The grooves of the portcullis are still intact, with a modern portcullis in them. The present gatehouse is in the plain style of the fourteenth century, with flanking turrets, plain and massive, with a groined vault over the archway. The apartments on either side of the gateway are occupied by the head gardener, Mr. Payne. Beyond the gateway is the courtyard. It is here that the flower-shows are held, and where many well-known horticulturists of the West meet. It was interesting to watch the bishop, a venerable gentleman, now in his eighty-fifth year, inspect the various exhibits, evidently with the keen interest of the horticulturist, and to note the good feeling between master and man which entire confidence and long faithful service engender.

The courtyard contains many fine old forest trees, which partly conceal the ruins of the great hall, the windows and archways of which still retain traces of their former grandeur; it measured 156 by 66 feet, and had a roof similar to that of Westminster Hall. This fine hall is said to have been stripped of its timber, lead, and whatever else of value it contained, by Sir John Gates, who was for a short period in possession. In the turbulent times of the Commonwealth, the palace experienced the fate of many other fine buildings at that period. Upon the restoration of Charles the Second, Bishop Piers found the palace roofless, and otherwise despoiled.

The ground floors are in their original state. There is a fine historic chapel, an extensive library, and picture gallery, the latter modernised, and containing many portraits of bishops, prominent among them being Bishops Laud and Ken (author of the morning and evening hymns), and Thomas Wolsey, in his cardinal's robes, a copy of the celebrated one in Christ Church, Oxford.

On the lawn, south of the great hall, are many trees and shrubs of more than ordinary interest. *Ailanthus glandulosa* is a giant, with a trunk 15 feet in circumference; *Pyraea japonica*, growing on the open lawn, is a perfect bush, with a circumference of 75 feet; *Catalpa syriaca*, *Robinia*, *Liriodendron tulipiferum*, *Crataegus tanacetifolia*, *Ginkgo biloba*, and many other trees and shrubs, are of great size and age, and are well in keeping with the venerable pile which they surround.

The kitchen gardens and houses are without the palace, and are approached from it by a wooden bridge which spans the moat. As may be expected from a place where so much entertaining is done, these gardens are extensive. Five acres are heavily cropped with vegetables, while hardy fruit of all kinds is largely grown. Apples are particularly well grown, one dish of Peasgood's Nonsuch Apple having won one Bronze Bankian and three Silver Medals this season.

The houses are old-fashioned, awkwardly-built structures, but in spite of this serious disadvantage, they were teeming with excellent produce at the time of my visit. The early houses were cleared of their fruit, and flowering plants had been installed. The late vinery contains two Vines only, Tottenham Court Muscat, and Alicante, the latter worked by Mr. Payne fifteen years ago on West St. Peter's stock; it carries fifty-two bunches, none of which are under 2 lb. each, and many considerably over 3 lb., and perfect in bunch, berry, and finish. The Melon-houses were heavily cropped with a handsome seedling variety, not yet in commerce, a few of those

cut turning the scales at 6 lb. each. The scores of fine fruit hanging testified to its productiveness and constitution.

Chrysanthemums, *Poinsettias*, *Primulas*, and *Epiphyllums* are largely grown for exhibition purposes, and the plate in Mr. Payne's possession testifies to his success as an exhibitor. There are also the usual complement of stove and greenhouse plants grown for decorative purposes. *W. R. W.*

PLANT NOTES.

WHITFIELDIA LATERITIA.

THE above plant is the only representative in cultivation of this small genus, which possesses only two species. As its flowers are produced at this dull season, when bloom of any sort is scarce, it only requires to be better known to become more popular in our tropical-houses. It is a native of the interior of Sierra Leone, from whence it was brought by Mr. T. Whitfield in 1841. The figure in the *Botanical Magazine* was made from a plant flowering at Kew in October, 1841, where it is remarked that the same plant was still bearing flowers in March, 1845. This is accounted for by its racemes of flowers opening in succession from the base, which are of a bright brick-red colour, and produced from the apex of every growth. The leaves are of a pleasing green colour, and produced in abundance, forming a pretty contrast to its drooping inflorescences. Our plant has already been in bloom for about a month. In regard to cultivation, nothing can be more easy, and it succeeds well either planted out or in pots; a good rich compost of loam, leaf-soil, and sand will give good results, and, with judicious pinching, fine plants may be obtained in the course of a year or two. Cuttings strike readily in spring, if given bottom-heat, and after rooting should be placed upon a shelf as near the glass as possible, to ensure a sturdy growth, and be shifted into larger-sized pots as required, until about the end of July. *H., Royal Botanic Garden, Edinburgh.*

BANKSIA COLLINA.

Seldom are the members of this interesting genus found outside of our botanic gardens, and this is the more to be deplored considering the beauty of their foliage, and the remarkable character of their inflorescences. A plant of the above-named species has been in flower here for several weeks past, its bottle brush-like heads of flowers springing from the forking of the branches, being particularly striking; these are of a yellowish colour, with the pistil standing out, and the stigma turned back, in the shape of a hook. The leaves are about 3 inches in length, of a dark green colour above, whilst the under-surface is covered with silvery hairs. The figure in the *Botanical Magazine*, t. 3060, under the name of *B. littoralis*, was taken from a plant flowered here in 1830, *littoralis* being one of the three synonyms this plant has received. For the successful culture of these plants an intermediate or greenhouse temperature is necessary, and, when established, they seem to enjoy being planted out. Our plants, recently planted in the temperate-house in pure loam, are doing exceedingly well. For pot culture, it is perhaps preferable to use a small amount of peat, together with good fibry loam and sand, potting firmly being an essential point. Cuttings, although not difficult to strike, take a considerable time to root, in a sandy peat soil, and, when struck, should receive as much light and air as possible. *H., Royal Botanic Garden, Edinburgh.*

CENTROPOGON LUCYANUS.

When properly grown this is one of the brightest plants to be found in the warm greenhouse; and at this season of the year its terminal clusters of bright carmine-crimson tubular flowers are vivid and very effective. Mr. J. Dinsmore, gardener to T. F. Blackwell, The Cedars, Harrow Weald, grows a quantity of it in 48-size pots, which give a fine show that will continue well into the new year. *Plumbago rosea*

is also grown in the same way, the plants being cut down annually after flowering, and it is also a very useful decorative winter plant.

BEGONIA MRS. JOHN HEAL.

This fine hybrid, between a rose-coloured tuberous Begonia and *B. accotrana*, raised at Messrs. J. Veitch & Son's Nurseries, King's Road, Chelsea, proves to be a true winter flowerer, and its large rose-crimson flowers borne above its fleshy, bright-green foliage are very handsome, and especially useful at this time of year. The seedlings have produced both double and single flowers. *J. O'B.*

THE SHANKING OF GRAPES.

DOUBTLESS there are various circumstances connected with our artificial culture of the Grape which produce the above complaint. These are chiefly owing to the large departure from nature which we have made in the matter of the plant's surroundings, and much good may result from the consideration of them in your columns. I have had many instances of outdoor Grape culture under my notice in Kent in past years, the varieties having been Black Hamburg, Espérone, Black Cluster, Foster's Seedling, Buckland Sweetwater, Royal Muscadine, and Dutch Sweetwater. These were cultivated mostly on a south wall, in a well-drained soil, overlying limestone, without any artificial preparation. No great quantity of manure was afforded, and the growth of foliage was encouraged by laying-in some strong young rods each season. Water was not afforded the border unless the season was an exceptionally dry one. I cannot remember ever seeing a shanked berry during the whole period. The most satisfactory varieties were Espérone and Royal Muscadine, which ripened fairly well in most years, but the others only in the warmest summers. But the point to observe is, that there was no shanking of the fruit.

I have seen many cases of it under glass in some of the best managed vineries and gardens, and I am certain it arises from a variety of causes, among which I would include ill-drained and made borders, poverty of the soil, overcropping, dryness at the roots, insects which injure the foliage, denuding the plant of foliage, weakening of the plant yearly by severe barking of the rods and plastering, unnatural climatic conditions. These may all be classed under two heads, (1) insufficient food for the crop; and (2), impairing of the vitality of the plant. To take them into full consideration is impossible without infringing too much on your space; but a little more detail may be useful: first, as to badly-made borders; i.e., lack of or insufficient drainage, where drainage is required; and the use of, it may be, good turfy loam and manure, very good, too, for the first four or five years, but which gradually becomes soured and pasty. It should always be borne in mind that the soil of the upper 3 inches of an old pasture contains but few stones, but chiefly consists of worm-casts, the excrement of animals, decayed leaves and other vegetable matters, together with the roots of grass and other plants, and in its natural state it keeps sweet when it is well drained; but when removed, and laid perhaps 3 or 4 feet deep in a Vine-border, these conditions are changed, and we should always do right if we mixed plenty of small stones or similar material in it, so as to keep it aerated and sweet.

Poverty of the Soil.—All that our hot-house Vines extract from the soil by their leaves, fruit, and wood does not again return to the soil, and Vines in vineries are in this particular under very different circumstances to those growing in a vineyard, which, instead of being confined to narrow borders, have practically an unlimited root-run; so that if we wish the Vinea to keep in good condition year after year, we ought to supply much more food than that which is removed. I well remember one case of shanking, which was clearly traceable to insufficient nutriment.

Overcropping.—This has a decided relation to the cause just considered. It will be evident to most people that the quantity of fruit a Vine can properly mature will depend entirely on the amount of food within its reach and its capability to elaborate this

FIG. 113.—PLANTATION OF MARRAM GRASS. (SEE P. 750.)

FIG. 114.—MARRAM GRASS: SHOWING METHOD OF PLANTING. (SEE P. 750.)

food in its leaves. Good cultivators endeavour to keep these principles always in view, so as to preserve the balance between the foliage and the crop. An overcrop does not always cause shanking during that season, but it may so weaken the Vine as to produce that result another season.

Dryness at the root.—This is always bad for the Vine at any time of the year, and if allowed to occur during the period of rest, it is not unlikely to extend through the period of growth also, owing to the difficulty there is always experienced in saturating a large mass of dry soil; and the result is shanking and other evils. The rule should be that whenever water is applied, it should be in abundance.

In the second class we have *insect pests*. It is unnecessary here to particularise these; every Vine grower, if he wishes to get a good crop, must be perpetually on the watch for them. The point I wish to impress is, that shanking may be traced to the check their ravages give to the Vine at a time when its needs are the most urgent; and dryness at the root, a cold and wet border, over dry or too steamy atmospheric conditions will all cause trouble in this way.

Denuding the plant of foliage.—This is perhaps not so common as it was twenty or thirty years since, for we have made progress since then, but it has not quite died out. The foliage on the main laterals should be thinly and evenly disposed, and the shoots stopped as soon as possible, and on no account should overcrowding be allowed; the sub-laterals should be stopped as soon as ready for it, and the next growths pulled out when young. Having done all these things, there will be no necessity to take away a large quantity of full grown foliage at any time.

Weakening of the Plant by barking, &c.—There yet remain large numbers of Vines which have been ruined by this system, and although we are getting into a more rational system, it is still recommended and practised by some growers. I once heard it compared to stripping a man to his skin, and plastering him over with all kinds of filth; the rods under this treatment eventually cease to increase in size, and then there is no longer any prospect of first-class Grapes from them.

Unnatural Climatic Conditions.—It is of course impossible to grow Vines under glass without putting them to a certain extent under "unnatural conditions," but with all plants there is a limit to the changes they will bear in this direction, and if we get beyond this point we are courting failure. The air of a vinery should never feel close, or be overcharged with moisture, as this is far from being the conditions under which the Vine grows in the open air; and if it be carried out persistently, is sure to result badly. Even Vines which have shanked badly with the ordinary crop when forced early, will finish a few bunches as a kind of second crop on the sub-laterals, perfect in colour, and without any shanking, because the Vines have had plenty of air since the first crop of the year ripened, and they have existed under conditions that are more like those in a state of nature, with the exception of having glass over them. The air of a vinery should always be kept brisk and sweet, and much cooler by night than by day.

The causes of shanking being so various, it is impossible to find a remedy that is infallible and applicable to all cases; and the intelligent cultivator will take all things into consideration, and find a remedy for shanking by removing the cause. *W. H. Divers, Ketton Hall Gardens, Stamford.*

NURSERY NOTES.

MESSRS. E. D. SHUTTLEWORTH & CO.,
LIMITED.

This enterprising firm at Peckham Rye has made much progress during the present year. At the end of last season the company had been newly arranged but a short time, and its spirit of progress was already taking effect in proposals for increasing the house accommodation at Peckham Rye, and for developing the capability of the ground taken at

Fleet, Hants, and of stocking it with a collection of herbaceous plants, &c.

The greater part of these ideas have been carried out, and there have been erected three good houses, each 100 feet by 36 feet, and several useful pits, a very fair addition to an establishment in one season. Nevertheless, they are comparatively well filled with stock, which seems to have increased just in equal ratio. Judging from what we saw when at the place some little time since, the additions have been much in the way of market plants, for these are present in much larger quantity, and in greater variety, whilst general plants have increased to a fair extent.

The firm has exhibited during the season very frequently, and especially during the first half of the year, groups of well-cultivated plants were almost always to be seen at the meetings of the Royal Horticultural Society at Westminster. The general collection of the plants at home is similar. Cleanliness prevails everywhere, and the plants appear to be grown as hardy as possible, thus preparing them, as far as is possible, to bear any change of conditions they may endure when removed from the nursery. This refers particularly to Palms and such-like plants that are often coddled far beyond what is necessary. *Kentia Belmoreana*, *K. Canterburyana*, *K. Forsteriana*, *Areca Baueri*, *A. lutescens*, *Geonoma gracilis*, and several of the poplar species of *Phoenix*, are in greatest numbers, but there are also some good plants of *Livistona chinensis* (*Latania borbonica*), and *Corypha australis*. Though most of them are in the young stage, many good specimen plants are kept for supplying orders that may be received for such stock. *Aspidistra lurida variegata* is done well, and sold in large quantity, being one of the best market plants grown; whilst the pretty *Araucaria, A. excelsa*, is also liberally treated. Many other good foliage plants, including *Aralia Sieboldii* and *A. S. variegata*, and the handsome *A. Chabrieri*, are in the same excellent condition as are the others.

Dracenas and *Crotons* form quite a speciality, and many very successful exhibits of the latter have been made during the past two years. All the more popular varieties of *Dracena* may be seen, and a long list of *Crotons* in variety could easily be enumerated.

It surprised us to hear that the market for *Asparagus plumosus nanus* was not so brisk as it had been. It may be admitted that it has a drawback if required for arranging with cut flowers in vases, through its essentially drooping habit, but the same characteristic is its chief recommendation for trailing work, the decoration of rooms, or for intertwining with shower bouquets, and for such purposes a more charming or graceful plant cannot be named.

Ferns, again, are grown in immense quantity, and the kinds in stock are those most valued for hardiness of constitution. A variety of *Pteris tremula* called *P. t. Smithiana* is especially deserving notice, as being dwarfer in habit, with shorter, more compact fronds than the type, and being prettily crested at the apex. The trade done in Orchids is not large, but there are some fine large plants of *Dendrobiums*, *Cattleyas*, and *Cypripediums*, that give a rare lot of bloom each year. *Maxillaria spicata* was carrying a nice lot of bloom, and some good plants of *Coclogynes* in pans were just in sheath, and promised a fine display.

Flowering plants are not by any means neglected. *Azalea mollis* is forced in hundreds, and a large stock was to be seen ready for that purpose; and batches of *Azalea indica* which had been grown at home were hardly distinguishable from the luxuriant imported plants, so healthy did they appear. Lilies of the Valley are also made much of for the purpose of forcing, some of which were exhibited in bloom in the early days of November. Double-flowered Primulas occupied a couple of shelves in one of the houses, and have given a lot of bloom. *Bouvardias* were the conspicuous feature in another house, and were the remaining plants after the orders had been fulfilled. These were being utilised for producing cut bloom.

Many miscellaneous plants, such as *Callas* (which are in fair numbers), *Ericas*, *Pelargoniums*, *Gardenias* (in capital health), *Boronias*, *Carnations*, pot *Roses*, &c., were noticed.

The nursery at Fleet, Hants, is said to be giving the most satisfactory result to be wished. The ground has proved especially well suited to the growth of bulbs, *Roses*, and hardy plants generally, including fruit trees, excepting those required for standards, as the soil, which is remarkable for increasing fibrous roots upon the plants, does not induce such thick and sturdy holdfasts as are desirable for standards, and which are generally obtained from a stiffer soil. Samples of most of the herbaceous plants grown at that place are kept at Peckham Rye, arranged in beds, for the convenience of visitors.

Since the company has become "limited," there has been an attempt to introduce the co-operative system amongst the employes, and already most of the foremen of departments have an interest in the firm.

The nursery is about 1 mile from Peckham Rye station, and half-a-mile from Honor Oak Station, on the London, Chatham, and Dover Railway.

PARKSTONE NURSERIES, DORSET.

These nurseries cover an area of several acres in extent, and are situate within a few hundred yards of the railway station of Parkstone, and a few miles distant from Bournemouth, in which town the proprietor, Mr. T. K. Ingram, has an establishment for the sale of cut flowers. That the mild and salubrious climate of Parkstone—"the Mentone of England," is conducive to a free and healthy growth the condition of the trees and shrubs at the time of our visit (the middle of November), fully testified. A fine specimen of *Chamærops Fortunei* was observed growing in the nursery-grounds in front of Mr. Ingram's house.

The glass-houses are numerous and are well filled with plants of a decorative character, among which were noticed large quantities of *Ficus elastica variegata*, as well as the green form, about 20 inches high; *Dracena angusta*, about 24 inches high, and well furnished with dark-green narrow arching leaves from the pots; *Poinsettia pulcherrima*, about 12 inches high, growing in 3-inch pots, and developing nice heads of crimson bracts; *Callas* (*Richardia æthiopica*) to the number of 700 or 800 plants, growing in 6-inch and 7-inch pots, and all showing flower. When the plants are gone out of flower they are partly rested, and a few weeks later they are turned out of the pots, the old soil being shaken off the roots, and they are re-potted into the best loam at command, water being afforded to settle the soil, and afterwards when needed. Thus treated, the plants can be had in flower earlier in the winter than would be the case had they been planted out. *Bouvardias*, *Vrelandii* (white), *President Cleveland* (red), *Priory Beauty* (pink), *The Pearl* (white), *F. V. Raphael*, semi-double (light red), the plants being dwarf and well flowered; double white *Primulas*, and large quantities of *Maidenhair* and other Ferns, mostly in 3 inch pots, were also noted. Bulb-forcing (in boxes, and planted out in beds in the forcing-houses) is carried out somewhat extensively, and with success; in the Parkstone nurseries, 20,000 *Narcissus* and 40,000 crowns of *Lily of the Valley* (Berlin crowns) being among the number of bulbous plants annually forced to meet the growing demand for choice cut flowers during the winter and early spring months. *Chrysanthemums* are largely and well grown. *H. W. W.*

MESSRS. W. L. LEWIS & CO., SOUTHGATE, N.

As in most of the nurseries in which Orchids are cultivated with success, the number of the houses devoted to these plants steadily increases. The large house for *Cattleyas*, in the course of erection at the time of our last visit, is now filled with these plants and *Lælias*, consisting of many rare varieties and extra fine specimens, and all in very fine condition. But now that the last new erection is fully stocked with plants, the need of more space appears

to be urgent, and the groundwork of some additional houses has been commenced. All the houses are specially erected for the cultivation of Orchids, and that circumstance, and the cultural skill of the manager, Mr. Ashton, have conduced to make this nursery a model of a neat Orchid-growing nursery. The show of plants in flower of *Cattleya labiata* and *Dendrobium Phalanopsis Schroderianum* is just passed over, and the display now consists of *Cypripediums*, crosses of which are here raised in moderate numbers, amongst them the beautiful *C. × aouthgatense*. Among those in bloom are the very pretty *Cypripedium × Pallas* (*callosum × calophyllum*), *C. × Harrisianum superbum*, a magnificent form; *C. × Evenor* (*Argus × bellatulum*), a beautiful cross, and evidently a freer grower than most of the *C.* similar crosses; *C. × rubrum* (*venustum × Hookeræ*), a singular-looking and dark red-tinted flower; a new cross between *C. × Harrisianum* and *C. Dayanum*, with flowers like those of *C. × Harrisianum roseum*, but with a larger lip, the petals horizontally extended, like those of *C. Dayanum*. *Cypripedium × Aylingii* is a thriving plant; and among the new arrivals is an excellent lot of the new *Cypripedium Charlesworthii*. With the *Cypripediums* were some well-flowered plants of *Calanthe × Veitchii* and varieties of *C. vestita*, the violet-accented *Cymbidium sinense*, *Cœlogyne Massangeana*, a fine strain of *Oncidium curtum*, and *O. Forbesii*, with strong flower-spikes; *Zygopetalum Mackayii*, *Compactia macroplectron*, *Dendrobium × Cassiope*, &c. In a small lean-to house some specimens of *Phalanopsis*, large and small, thriving in the most satisfactory manner, and flowering profusely, were noted. *Phalanopsis* are among the most troublesome of subjects in gardens, but we have observed that in most cases where a warm moist house without doors opening directly into the outer air is tried for them, the plants are generally successfully managed. In the same house were some sturdy little plants of home-raised crosses of *Cypripediums*, the result of crossing rare species, and many of which it is hoped will flower next season.

The occupants of the new *Cattleya*-house were in splendid condition, consisting of fine varieties of *Cattleya Mossiæ*, and others, large-flowering *Cattleyas* predominating. At one end of this house a collection of *Lælia purpurata* was remarked in vigorous condition, and sending up flower-sheaths in satisfactory numbers. Of plants in flower mention may be made of *Pleione maculata*, *Cattleya Holfordii*, and *C. H. Rozzlii*, the latter with purple markings on the labellum; and a plant that may turn out to be a *Cattleya maxima* cross, is expanding its showy flowers, besides which were good examples of *Lælia anceps grandiflora*, &c.

The low span-roofed houses are chiefly filled with *Odontoglossums*, showy *Dendrobiums*, *Masdevallias*, and other Orchids of the cool-house, all of which are clean and healthy. In one house was a number of *Lælia majalis*, *Oncidium nabigenum*, *Odontoglossum crispum*, *O. Pescatorei*, &c., some being in bud. In flower were *Lycaste Skinneri*, and a plant of the best known variety of *L. S. alba*; many forms of *Lælia albida*, the fragrant *Trichosma suavis*, the pretty *Oncidium cheiroporum*, *Sophrontia grandiflora* and its variety *rosea*; and well advanced in bud were a great number of pretty and rare things which will continue an interesting show of flowers throughout the winter and spring.

FLORISTS' FLOWERS.

"STOPPING" CHRYSANTHEMUMS.

I HAVE so much respect for Mr. Douglas, knowing him to be a most conscientious adviser, that I feel some diffidence in calling in question his directions with regard to the above; still, I feel that exception must be taken to what he writes on p. 716 of the *Gardeners' Chronicle* in regard to incurred Chrysanthemums which may be grown to produce exhibition blooms. The methods he advises of stopping the

plants of various members of the "Queen" family, Princess Teck and its sports, Prince Alfred and Jeanne d'Arc, may answer for a home display of flowers, but when it comes to the finest blooms possible for exhibition, that is quite another thing.

It has long been admitted that, to obtain the finest results, the plants must be of mature growth. My argument is, and always has been, that to give the best results the plants must be allowed to grow somewhat naturally. The multiplication of shoots from the single stem raised from a cutting is brought about by natural means, such as bud formation, which check, for a very short time, the growth of the main shoot, inducing additional side shoots to form, and thus the requisite number of flowers is obtained. My contention is that, if the cuttings are inserted during the month of December, in a similar manner to that described by Mr. Douglas, the plants encouraged to grow freely, providing them at all times with abundance of space so that the ripening of the wood may proceed at all stages, blooms of the finest quality are the result, and the plants which are managed on this principle will generally show three buds, the third one about the last week in the month of August, or as it sometimes happens, early in that of September. Cultivators of experience know that it would be useless to "take" buds that formed before the middle of the first month named, as these furnish rough and uneven blossoms; and if these buds are rubbed off others will form in the course of three weeks, and from these are obtained highly coloured and finely-formed blooms. It should not be assumed that I refer now to and advise the use of terminal [final] blooms. Although the "crown" bud is generally regarded as being the second bud formed, it is not always so; certainly not in the case of the "Queen" family—very many plants showing two buds which cannot be distinguished from one another, and after that, a bunch of terminal buds would follow.

Mr. Douglas, I see, takes exception to *Empress of India* and *Lord Alcester* in the matter of stopping. I wonder why? I have never yet been able in any way to distinguish between the original member of this family and either of those named in the matter of growth. And this being an admitted fact, why should these two members of one family require different treatment? My experience compels me to say, that nearly all sports are the exact counterpart of their parent in the manner of their growth.

Especially do I think it is a mistake to treat the members of the Teck family in this way of stopping their shoots in April or any other time. No variety requires so long a season of steady growth as the members of this type. If what are known commonly as "crown" buds—the second formed are taken before the last week in August, they are certain to develop rough and pale-coloured flowers. When the plants are managed on the non-stopping method, the third bud formed early in September gives the best results. Many blooms of *Hero of Stoke Newington* find their way into the back row, and deservedly, too; but more into the middle row of a twenty-four stand, this being the largest variety in the family. *Charles Gibson*, *Lady Dorothy*, and *Mrs. Norman Davis* also are very often found in the middle row; *Lord Eversley* and the original generally occupying the front row. I cannot help thinking Mr. Douglas made a mistake when he said that these varieties are only good for the front row. *E. Molyneux*

THE AURICULA.

At mid-winter there is not much that can be done amongst florists' flowers; and just because the plants require so very little attention I feel constrained to write about them, so that the little they need may not be altogether neglected. In damp close weather they are as likely to suffer injury from damp as from any other cause. The frost causes the leaves to decay, and these should be at once removed, as they are sometimes the cause of the plants decaying at the neck, and when removing these leaves see that the decayed portion attached to the stem of the plants is entirely removed. As I write these

lines the weather is mild, and has been generally so for some time; and this has caused the plants to grow rather more than is good for them. At mid-winter it is better that they should have a touch of frost; and if the soil is frozen through, the plants really seem to benefit by it. I mention this because a good Auricula fancier, the late Kirke Penson, Esq., told me he never liked to see the plants exposed to frost; probably he may not have given them a chance to be frozen through and through, and could not speak from experience. A good frost causes the leaves to go rapidly off by decay. Slugs and the leather-coated grubs may get into the frames; if they do, see that they do no injury to the plants—let them be watched for at night with a good lamp, and be destroyed.

The small seedlings now in flower-pots or seed-pans, should be placed in a house or pit from which frost is excluded, so that they may not be thrown out of the soil by frosts; or even checked in their growth. Our object is to get the plants to grow to a flowering size by the end of the ensuing season, which they will not do unless they are kept steadily growing from the first. The very small off-sets which were put in late and have scarcely made any roots, should also be placed with the seed pots or pans near the roof glass. Those who have seed to sow should now sow it, if they are able to place the seed-pans in a pit from which frost is excluded, if not, I would wait until February.

CARNATIONS AND PICOTEES

are like the Auriculas, growing rather more than we like to see them, especially those of us who are looking forward to getting the best head of bloom about the date of the National Society's Exhibition in July. However, this is a matter over which we cannot have much control; all that can be done is to admit as much air as possible by night as well as by day, shutting up the houses or frames on those nights when sharp frosts are likely to occur. The plants ought not to be allowed to become dusty-dry at the roots; nor should they be watered until they are well on the dry side, and here again the anxious amateur, with not much experience in the culture of plants, is likely to ask: How often should the plants be watered? No one can give anything like a definite answer to this question. It depends all upon the weather. In frosty weather long continued they require no water all the time. In mild weather they are looked over once a week, or twice, as indicated by the appearance of the plants. All plants must also be kept clean, decayed leaves should be removed, and green-ly be wiped off with a brush or destroyed by fumigating.

Fungoid diseases, such as spot, are favoured by damp weather, and spread if the plants are kept in frames or placed in the open garden; but in the drier air of a greenhouse they will disappear, and never spread to other plants in a dry atmosphere. Another fungoid disease, *Uromyces caryophyllinus*, is not so easily disposed of, it has, unfortunately, become very common in collections, but there is no safety with it on the place, and unless it is stamped out on its first appearance, the cost of cultivating the Carnation will be enormously increased. The only way to make sure of its destruction is, cut off the leaves affected as soon as the blisters appear. If they are allowed to burst open, and the coffee-coloured spots are allowed to fly about in the air, it will be absolutely impossible to get rid of it. This fungus seems to thrive best in a dry warm atmosphere, therefore it is much better to attack now when least active. It seems to take more kindly to Carnations of the Malmaison type, and spreads more freely under glass than in the open air; in this respect it is totally different from the disease termed "spot" (*Uredo dianthi*), which increases in a damp stagnant atmosphere. I have had specimens of the *Uromyces caryophyllinus* sent to me which had taken entire possession of the Carnation plant, so much so that nothing could be done except to burn up the entire plant. Another good grower wrote to say that his entire collection of plants of Mrs. Reynolds Hole was destroyed by it. *J. Douglas, Ilford.*

WOOD NOTES.

In the *Year-Book* for 1891, published in Hobart by the Tasmanian Government, there was printed a section relating entirely to the trees of that wonderful and pleasant land—the health-resort of the Australians. Of course, these are duplicates of the varieties found in the adjoining Continent—majestic in their towering grandeur, and of vast economical importance. In the work quoted are appended to all the botanical descriptions, reports from civil engineers and other scientific men who had thoroughly tested the timber in all forms, and as applied to every conceivable industry. Well, the other day, thinking over the enormous waste going on in America, as well as the vast output for commercial purposes, the thought occurred that there were still enormous fields to draw from at the Antipodes, and with the knowledge that our streets were being paved with blocks of Jarrah-wood from New Zealand, inquired of the Agent-General for Tasmania concerning the timber imported by us from that island. None!—or rather, to be quite correct, “practically there is no export of timber from Tasmania to England. The total sent home in 1891—the latest date for which there are complete returns—being of 108 superficial feet, valued at £21.” And Westlake of Tabernacle Street, Finsbury, E.C., was the importer. A “note” in connection with the firm’s colonial operations, Mr. Peace, of the Natal Government Office here, dated to us that they exported no timber—they imported some. From Tabernacle Street went these imports—some veneers! One timber merchant suggested that some of our colonial friends were inclined to sit down, and let other people do the shifting—more’s the pity.

It would appear that the vast increase in electric installation affects the demand for American Walnut, and that on occasion that all-round timber, white Pine, does duty for Walnut of all shades, being wonderfully amenable to staining and varnishing! Teak, of course, and Rosewood, with Mahogany, “go well” with the new light, and magnificent combinations are spoken of in which woven set-pieces of foliage and flowers—loose panels, in fact, for shifting, play, or will play, an important part. A set of bold oblong panels of the kind would suit many a ball-room, dining, or drawing-room; and hint at the revival of an occupation for the gentler sex, which could be made to grow into an industry of a no mean order.

It may be safely said that we do not know half enough of colonial horticulture; its agriculture we are beginning to know something of through dairy-farm products coming all the way from New Zealand, and successfully competing with contries nearer home. As several London merchants said to us, there is no reason why timber from the Antipodes should not take rank in this country, widely useful as it all appears to be; but the respective Governments should take the matter in hand, and place conveniently-sized samples before the public whenever and wherever it can be done; or they might have agents who would contract for supplying timber, just as English firms do, and soon there would be a paying demand; but the sitting-down policy will never do. To our colonial friends interested in the opening up of what would really be a new trade, we may recite the words of more than one firm of London timber-merchants, viz., that all vendors of any repute will most willingly make room for good sound stuff, no matter the quarter from whence it comes—provided always that there is a market for it. E. C.

THE ALPINE GARDEN.

SAXIFRAGA FORTUNEI.

This is the latest Saxifrage to bloom in the open, and often gets cut off by frosts. The flowers are pure white, and produced in graceful racemes, being very welcome on an autumn day in the open, when few other things are in bloom. It is, however, better to grow the plant in pots, and when in flower they can be removed to the greenhouse from the cold

frame, in which they will succeed perfectly well. *S. Fortunei* is not difficult to grow, and ordinary soil will suffice, whilst propagation is effected by division. There are some kinds allied to this species, as *S. cuscuteiformis*, which blooms freely over a long season, and *cortusaefolia*, but the most useful and beautiful of all is *S. Fortunei*. It is a native of China and Japan, and in the more southern counties of England could be trusted in the open; but, as a rule, to enjoy the beautiful racemes of flowers, the protection of glass is requisite. This species is quite as well worth growing as *S. longifolia*, as it blooms at a season when one appreciates the flowers more even than those of spring or summer. F.

THE WEEK'S WORK.

THE KITCHEN GARDEN.

By H. C. FRINSEP, Gardener, Buxted Park, Uckfield.

OUTDOOR WORK.—While the weather remains open, operations out-of-doors should be expedited, especially the digging and trenching of the soil, if it be stiff and adhesive. Digging does not always get the amount of attention it deserves, and it is a common practice with stiff soils to dig them two spits deep, throwing the top spit into the bottom of the trench in large masses, which remain in that condition till turned up again. The spits that are turned into the bottom, if at all stiff or close, should be rendered fine by chopping them with a spade, whereas the soil which is brought to the surface should be left in as rough a state as possible. [For a time. Ed.] One often sees the ungenial sub-soil brought to the surface, whilst that which is fertile is buried beyond the reach of the roots of most kinds of vegetables. This is a mistake; and the lower stratum of soil, if it be at all infertile, should be left where it is, merely turning it over with the fork or spade.

CELERIAC *Kohl Rabi*, *Stachys tuberifera*, &c., left in the ground, should be covered with litter sufficient to exclude frost.

LETTUCE.—A sowing of Cabbage varieties should now be made on a warm bed, and for early work none is better or earlier than Golden Queen, whose colour is all that could be desired, and it turns in much sooner than any green variety, and as there are no outside leaves, the plants may be planted rather close together.

CARROTS in hotbed frames will now be growing fast, and snails and slugs must be diligently kept under, or they would clear a frame of Carrots in a short space of time. Lime acts as a deterrent, but in mild weather they should be sought for with a lamp after dark. Another sowing may be made.

INDOOR WORK.—Potatoes for seed should be examined, and the best tubers selected for sets, and if these are kidneys standing them on end. Carrots, Beetroots, and other roots in store, should also be looked over, removing any growths and throwing away those which are decaying. Onions, Shallots, and Garlic require the same kind of care, or the rotting bulbs will soon affect others. Label, stake and peg making should be looked to in bad weather.

PLANTS UNDER GLASS.

By BAILEY WADDS, Gardener, Birdsall Gardens, York.

CRINUMS, IMANTOPHYLLUM MINIATUM, AND VARIETIES.—Any of these which have been rested as recommended in earlier *Calendars* may now be placed in a warm house without bottom-heat, and placed on a shelf or the bed, and well watered at once. It may be advisable to pick away the surface-soil a little, and afford some fresh rich loamy soil in its place.

TOXICOPHLEA SPECTABILE may now be placed in the stove or forcing-house if it has been well grown during the summer in the warm-house, and placed to rest in a cool-house for three months; its sweet-smelling white flowers will repay any care bestowed upon it. When resting in the cool-house, the plant should be kept rather dry at the root, but the foliage must be maintained in a good condition, no evergreen plant requiring to be so dried-off as to lose its foliage. Afford good waterings of tepid liquid manure to plants placed in heat—bottom-heat is not required by it.

AMARYLLIS OR HIPPEASTRUM.—A batch of early and well-ripened bulbs of flowering age, and in well-drained pots, may be placed in a moist temper-

ature of about 50° by night, 55° to 60° by day, affording them not much water before they grow freely. Keep them in a light and airy part of the house, and damp them overhead with the syringe at times.

PELARGONIUMS.—The show and fancy varieties which were potted in September and October should be kept near to the glass, and care taken with the watering and affording air. A temperature of 40° to 45° by night and 50° to 55° by day will be suitable, with plenty of air when the weather is mild. The plants should be occasionally turned round about, and fumigation resorted to if green-fly be present. Avoid damping them overhead, and keep them rather dry at the roots, but not so as to cause flagging. The foliage should be of a good green colour, the shoots trained out from the centre to the circumference, weak shoots cut out, and strong ones stopped.

SOUVENIR DE LA MALMAISON AND OTHER CARNATIONS require to be kept free of green-fly, and to have air afforded night and day when not in flower, and kept comparatively dry at the roots for some weeks to come; but as the plant is an evergreen, they must not be kept over-dry. Several kinds of temperature are required to have this variety in flower during the winter—one for the young stock, one for the growing plants coming on to flower, and another for those that are in flower. They should be kept apart from other plants, or they will get dirty.

VIOLETS will need careful attention, so as to ensure daily gatherings of blossoms, the frames being defended against low temperatures with dry mats and litter. Mouldy leaves and flowers should be daily removed, and air afforded night and day during mild weather, removing the lights altogether when it is sunny and mild. Afford the plants no water during these dark days unless they show signs of flagging.

HYACINTHS AND OTHER DUTCH BULBS.—The potting of these that have been kept back for late flowering should now be completed, treating these like the earlier-potted bulbs. Introduce some of the early varieties into the forcing-house; also more Lilacs, *Deutzias*, *Spiræas*, Lily of the Valley, *Azalea mollis*, *Freesias*, *Sweetbriar*, &c.

THE HARDY FRUIT GARDEN.

By T. TURTON, Gardener, Maiden Erlegh, Reading.

FIGS.—To ensure a crop of fruit from Fig trees on walls, the smaller embryo fruit must be protected from frost. Instead of the usual practice of protecting the fruits by binding the branches in bundles, and then covering them with straw bands, &c., the evil results of which have often been exposed, branches of Yew, Spruce, Fir, &c., should be tied over the main branches of the Fig trees, these providing sufficient protection. The withering and falling of the leaves in February and March gradually expose the Fig trees to the light, and in the event of a return of frosty weather more Fir or Yew branches, or even old fishing-nets may be placed over the trees if the protecting material should seem to have got very slight.

BLACKBERRIES.—The old growths which bore fruits may now be removed, and the young ones fastened to the trellis, at 9 inches or 1 foot apart. If the stools stand somewhat close together, rather than train the growths straight upwards, and have to shorten them too severely in the summer, let them run obliquely, crossing each other like diamond-paned windows, but do not crowd them together. With the introduction of American varieties of Blackberries a few years ago, many were led to adopt their cultivation, and the Wilson Junior variety, which was so much cried up at the time, has turned out to be one of the best of those introductions, if its requirements are fairly met. Unlike our common English Blackberry, which will bear and ripen as fine fruit in a shady position as when exposed, the Wilson Junior, a very strong growing variety, must have a sunny position, and where wired-walls with a south or westerly aspect can be devoted to its cultivation, it repays the cultivator. In soils which have become too infertile for the remunerative cultivation of other fruits, these Blackberries would prove a paying crop without further preparation of the soil beyond trenching it for a space of 3 feet or 4 feet distant from the wall. The Blackberries could be planted at 6 feet apart. Old or unsightly buildings, with the warm aspect above recommended, could soon be covered with the Wilson Junior, if the soil is not very suitable for other fruits. The cut-leaved variety is the best for growing

in exposed positions, over arches, wire-trellises, &c., or it may be planted to cover dead trees, in the shrubberies.

THE ORCHID HOUSES.

By W. HOLMES, Gardener, Pickering Lodge, Timperley.

HINTS ON CURRENT OPERATIONS.—The various plants of *Cattleya labiata* and *C. Bowringiana* have flowered freely, making a fine display in our houses during the past six weeks, and some few may last over the old year. Any of these plants which may stand in need of re-potting or re-dressing will be taken in hand before new roots push out in any number. It will be found necessary to break the pots, the better to get all the roots. Former directions with regard to re-potting, &c., will hold good for these plants. The old flowering-sheaths must be cut clean away, and but little water afforded the plants. It may here be said that *C. Bowringiana* should be potted on a rather higher mound of materials than most other *Cattleyas*, the new growths often breaking from the base of the previous growth, and given more materials they have a better chance of getting clear away. A very small quantity of water will be needed by this *Cattleya*, no more than is sufficient to keep the pseudobulbs plump. *Cattleya exoniensis* if in flower and in need of potting, will be better if this be done now than later. *Zygopetalums Mackayi* and *Z. maxillare*, now showing flower-spikes will, in each case, require abundance of water at the root. *Zygopetalum maxillare* grows better in the *Odontoglossum*-house than in any other. *Calanthe veratrifolia* and *C. Textorei*, both evergreen, if in good health will need watering at the roots plentifully, and a moist atmosphere should be maintained where they are growing. *Phaius grandifolius*, *P. maculatus*, and *P. Wallichii*, being strong-growing, fleshy-rooted plants, need to be carefully watered occasionally, weak liquid manure being applied at the root. A few *Dendrobiums* may be started in an intermediate-house, keeping them therein for a few weeks before placing them in the flower-house. Those plants which are started at at this period will flower during January, and any of the following may be chosen at this time, viz., *D. nobile*, *D. Wardianum*, *D. crassinode*, *D. Findleyanum*, and any of the garden crosses. The temperatures for the next few weeks may range as follows: *Cattleya*-house, by night 55° to 60°, by day 60° to 65°; *Odontoglossum*-house, by night 45° to 50°, by day 55°; *Phaius*-house, by night 60° to 65°, by day 70°; and East Indian-house, by night, 60° to 65°, by day 70°.

THE FLOWER GARDEN.

By T. H. CRASP.

LAWNS.—Any alterations or levelling of the land should, if possible, be taken in hand, and finished at an early date, the New Year bringing its own necessary operations in abundance. Nothing detracts so much from the appearance of a garden near the dwelling as an uneven lawn. In removing the turf previous to operations being commenced, let it be cut, "raced" is the gardener's term, into strips of 1 foot wide and 3 feet long, or in squares of 1 foot and 1 1/2 to 2 inches thick. If cut in the longer form, let it be rolled with the grass-side inwards, and stacked clear of the ground which is to be levelled. Then dig the land all over to a depth of 6 inches, and when that is done proceed to level it on a dead level, or a hanging level, using the line if the extent is not great, and if large the boning-stick must be used. Having put in the various pegs at from 10 to 12 feet apart, proceed to level the soil, carefully filling-in hollows and reducing hillocks, raking it roughly, and afterwards trampling it evenly and regularly all over, raking it again before placing turf in position. If the lawn showed signs of poverty in the soil, spread some rich soil over it before turving it anew, and in the early spring afford a manurial dressing of some kind. Lawns often get browned in patches, a circumstance that is due to a shallow, poor, sandy soil, or because there are foundations of old buildings or masses of rock just beneath the surface. In such cases the offending material should be removed and replaced with some good holding loam. Having laid the turves as close together and as evenly as regards the level as possible, proceed to beat it regularly all over. It may be beaten once or twice during the winter, when in a moist but not wet condition.

PRUNING SHRUBS.—Except when the frost is very severe, shrubs may be pruned and trimmed at almost any time during the winter. A good many species and varieties form well-shaped heads naturally and without any assistance in the way of pruning; but others require a few inches to be cut

off the branches that are crowding or overgrowing their neighbours. As a rule, amongst the Evergreens, all the Cypresses, Junipers, *Cryptomerias*, *Thuias*, do not need this kind of trimming, with the exception of an occasional shoot or two that has overgrown its bounds.

GENERAL WORK.—*Dahlias*, *Cannas*, &c., that were taken up and placed in a shed to dry, should now be put in a cool dry shed, where the frost is excluded, and covered with dry soil or ashes. It is a good plan to take up the roots of choice varieties of *Hollyhocks*, and plant them in a cold frame close together, ventilating them freely in mild weather. They may be wintered outdoors safely in southern counties, by protecting the roots with a good layer of ashes, and the tops in severe weather with some light dry litter, but even then it is risky in the case of choice and valuable varieties. Take every precaution to provide protection for any plant that is likely to suffer from frost. In wet or frosty weather plenty of work may be found indoors by making labels of various sizes, pointing flower-sticks, and tying them up in small bundles according to their length and size, &c. A good stock of birch-brooms might also be made in country districts where plenty of material is at hand. Pegs may be cut for layering and pegging down plants, and if all these little details are attended to at this season of the year a deal of time may be saved when the long and busy days come again.

FRUITS UNDER GLASS.

By M. TEMPLE, Gardener, Carron House, Falkirk, N.B.

CHERRIES.—Where early *Cherries* are required towards the end of the month of April, the present is a good time to start trees in pots, if they have been long enough time potted to be well established. Preparatory to putting the plants into the forcing-house, wash them with Gishurst-soup, and remove all inert soil from the surface without injuring the roots, replacing the same with loam, in which is well mixed some special kind of manure, and make this top-dressing very firm with the rammer, and for that purpose the new materials must be dry. Let sufficient space be left for affording copious waterings. Fumigate and clean the *Cherry*-house, and place the trees therein in such a position that they may be afforded plenty of air, and where the light is the best. *Cherries* are easily ruined by quick forcing, and at starting a temperature of 40°, with air put on daily, should not be exceeded by artificial means, although with sun-heat it may rise 10°, with plenty of air afforded, and this should be given early, so as to prevent a too sudden rise of the temperature. Sprinkle the trees once or twice daily with tepid water, and water at the soil as often as may be required, remembering that great dryness in the soil will check the trees as well as too much water. *Plums* may be forced in the same house with *Cherries*, doing well with the same management; and in either case, the varieties which fruit early are the most suitable. A few *Peach* trees, well established in pots, of the earlier varieties, may have a position with the above. Fire-heat is the most injurious item applied to fruit trees in pots, but cannot be entirely dispensed with.

FIGS.—Where these are grown in a house by themselves they are of easy management, still, in many *Peach*-houses good *Figs* are grown. When the roots of the *Fig* are confined to narrow borders or tubs, the affording of water is always a nice part of their culture, the untimely dropping of the fruit being often traceable to the maintenance of a damp surface on the soil of border or tub, while the feeding roots below are suffering from dryness. Heavy top-dressings of adhesive manures often lead to errors in watering. The use of cold water should be guarded against, and a crowded state of the shoots is not desirable, but short stiff growths are generally fruitful, and should be retained in preference to long-jointed ones. At starting, a temperature of 45° to 50° at night should not be exceeded, and a healthy atmosphere should be maintained by lightly syringing the trees and walls, &c., at shutting-up time. *Bush Figs*, if in pots, are easily managed, and may be prepared for forcing similarly to *Cherries*. They may be plunged in a bed of warm leaves, not exceeding 60° to 65° at first. Slow forcing is the rule during the first month after the plants are started, harvesting sunheat as much as possible in preference to using fireheat. If *Fig*-trees or bushes have been started to ripen fruit in April (many lose the crop by doing this) they may have a rise of temperature to 50°–55°.

when growth has really begun, and 10° higher when at shutting-up time if there is sun-heat. Syringe the trees in the afternoons, but avoid having much moisture in the house in damp or cold weather. If bottom heat be used it should not exceed 70°.

STRAWBERRIES.—Plants which are fruiting a second time require careful watering as the fruit shows signs of colouring, and manure in all forms must be withheld, and no more water afforded than will keep the roots healthy; ventilate freely, and expose the fruit to the light.

THE APIARY.

By EXPERT.

TWO QUEENS IN ONE HIVE.—Mr. Wells has just given his third season's experience of the working of hives on his double-queen system. The result is very satisfactory, and will, no doubt, induce many bee-keepers to supersede their present hives and go in for double ones. In the year 1891, Mr. Wells obtained an average of 128 1/2 lb. of honey from eleven hives; in 1892 an average of 158 lb. from five hives; and in 1893 an average of 136 lb. per hive from nine hives. He states that last season the bulk of the honey he obtained was gathered from the early blossoms of Plum, *Cherry*, *Pear*, *Apple* trees, &c.; and that afterwards there were scarcely any flowers in the neighbourhood of any use for producing honey. Sainfoin a mile away was cut before it came properly into bloom, and there was no white *Clover* to speak of. This being the case, it is very evident that if ordinary hives had been used little or no honey would have been obtained in such a district, as bees are rarely, if ever, sufficiently strong in numbers to store supplies so early in the year in hives of the present kind. Mr. Wells summarises his results for the past year as follows:—

108 1/2 lb. sections at 9d each	4	1	0
1115 lb. extracted honey at 6d. per lb.	27	17	6
19 lb. beeswax, at 1s. 6d. per lb.	1	8	6
			33	7	0
Less total expenditure	1	0	9
Balance for labour	32	6	3

In addition to this, no sugar was required for feeding, the bees having stored enough honey in the brood-frames to winter on. Apparently, there were no swarms from the nine hives, as none are mentioned, and this would coincide with the experience of most bee-keepers, swarming in 1893 having been quite the exception.

THE ABSENCE OF SWARMS IN 1893.—The abnormal season just passed was remarkable as far as bees are concerned in the persistency with which the combs generally used for the rearing of brood were crammed with honey, and the almost entire absence of swarms. The latter was no doubt the outcome of the former peculiarity, as the queens being restricted for want of room, fewer eggs than usual were deposited, and colonies did not increase much in strength. There would be also greater mortality amongst the adult bees, worn out with the extra incessant labour of honey-gathering. In an ordinary season, honey is obtained and taken into the hives at so slow a rate in spring that it is consumed almost directly by the ever-increasing brood, so that by May or the beginning of June the hives become so crowded with bees, that swarming takes place as a natural consequence, and more room is thus provided. The glorious weather coming so early, and at the period when fruit and other trees were clothed in bloom, caused more nectar than usual to be secreted, and gave the bees every opportunity to gather it, which they did, but preferred to store it in the cells which came nearest to hand, supers that were put on being quite neglected. The proper course to pursue under the circumstances, would have been to have removed as many of these heavily-charged combs as possible from the brood chamber, replacing them with empty ones or full sheets of foundation, so that the queens would have had greater facilities for depositing eggs.

ATTENTION TO HIVES.—The only attention that bees require now, is to see that the entrances to the hives are kept clear, so that ventilation is not impeded. A piece of wire shaped into the form of a hook may be used to clear away any dead bees that can be reached on the floor-boards that would be likely to cause this mischief. In the case of snow coming, the entrances should be shaded by placing a board in front, so as to prevent the sun being reflected into the hives and enticing the bees out to their destruction.

EDITORIAL NOTICES.

Letters for Publication.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for contributions, or to return unused communications, or illustrations, unless by special arrangement.

Plants, Fruits, &c., to be Named.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

SALES.

MONDAY,	DEC. 18.	Poaeae, Herbaceous Plants, and Dutch Bulbs at Protheroe & Morris' Rooms.
WEDNESDAY,	DEC. 20.	Dutch Bulbs at Protheroe & Morris' Rooms.
THURSDAY,	DEC. 21.	Consignment of Lilies from Japan, Begonias, Spireas, Roses, Greenhouse Plants, Azaleas, &c., at Protheroe & Morris' Rooms.
FRIDAY,	DEC. 22.	Dutch Bulbs at Protheroe & Morris' Rooms. Orchids at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—39° 6.

AMONG the "weeds" which have been turned to good account, and might be rendered much more useful (see p. 521), may be mentioned the Lyme grass (*Elymus arenarius*), the Marram grass (*Psamma arenaria*), *Triticum junceum*, and *Carex arenaria*. All these are common on our sandy shores, and, together with *Euphorbia Paralias*, *Eryngium maritimum*, *Convolvulus*, *Soldanella*, and many others, are enabled by means of their widely-spreading underground stems and roots to anchor themselves in the sand, whilst, by means of their internal organisation, they are specially well adapted to resist the ill effects of deficient moisture to which they are subject. Not only is undue evaporation provided against, but the structure of the plant permits the absorption and storage of water, so that it is rendered relatively independent of long spells of drought, and its skeleton of woody tissue enables it to withstand the force of the wind. The peculiar form of the leaves is also well-adapted to diminish the injury caused by the thick covering of sand to which they are exposed, and to resist the friction and cutting to which they are liable from the wind-borne sand grains. All these phenomena are obvious enough to those who observe the organisation of the plants inhabiting the sand dunes of our coasts. Here and there attempts have been made to turn these attributes to good account, but certainly not nearly to so great an extent as might be done.

Nature shows us the way, but we are laggards in following it. Nevertheless, it is quite certain that, once the sand is fixed by the systematic planting of sand-grasses, other vegetation can be grown with profit, and the desert be made productive. The young grasses, the Luzerne, and the Broom often sown with them, act as nurses to the seedling Pines; and other plants, which can, if thus protected in the early stages, be made to grow. We are familiar—by hearsay, at any rate—with what has been accomplished in South-Western France, where an entire province has been endowed with fertility, and a plague spot rendered healthy; and there is no reason but inertia why the same process should not be carried out elsewhere. Our excellent correspondent, Baron FERDINAND VON MUELLER, whose energy has apparently no bounds, has introduced the seeds of the Marram grass into Victoria, with results which are shown in the following extract, and in the engravings taken from photographs, for which we are indebted to him (figs. 113 and 111, p. 745):—

"The Marram grass, the seed of which was first introduced into the Colony of Victoria by the Government Botanist, the Baron von Mueller in 1883 (and by him entrusted to the Borough Council of Port Fairy for experiment on the barren shifting sand hummocks fronting the coast line of Port Fairy), has been proved to be the most effective sand-stay ever planted. Practical evidence of its value can be seen in the miles of sandhills now reclaimed by the Marram plantations, sown under the direction of Mr. S. AVERY, the park-ranger. So complete has been the reclamation of the lands, that where a few years ago not a sign of vegetation was to be seen, there now exists a succulent grass eagerly devoured by cattle, and growing to a height of 4 feet. Marram grass is practically indestructible—burning, cutting, or eating off only makes it thrive, whilst in exposed shifting sand it propagates as surely as in the most sheltered position.

"The following directions how to plant Marram grass have been prepared by the park-ranger: The grass to be planted in rows at a distance of 6 feet apart, the space between the plants to be at least 2 feet. The depth to which each plant is put into the sand depends upon the nature of the sand. If in sand not likely to drift for two or three months, 9 inches will be deep enough; but if very loose and shifting, the grass should be placed from 12 to 15 inches deep.

"A 'plant' consists of as much grass as a man can conveniently hold in his hand, and care should be taken to have the roots regular. The system adopted in planting is for one man to dig the hole, and another to put in the 'plant,' and well tread in round the same. After twelve months' growth, the plants are fit for thinning out and transplanting. Cattle should not be allowed to graze on the grass until the roots become thoroughly established. It takes 3630 'plants' to the acre; and there are about 2800 plants to the ton, thus 1 ton 6 cwt. will cover one acre.

"The most favourable time for planting is in autumn. The grass will retain its vitality, and strike root after being out of its sand bed for three months or more."

Another point which may be mentioned, is the value of certain plants in holding up clay banks by the sides of railways, or on our coasts. At Folkestone, for example, the gault, a limey clay, is notoriously treacherous, and the undercliff in Eastwear Bay testifies to the destruction that is constantly going on. The great clumps of Colts-foot, of Reed, *Phragmites communis*, the coarse tufts of Fescue, Brambles, and other plants with similar endowments, show what might be done, concurrently with other measures, to prevent this destruction. But it requires to be done

systematically and thoroughly, and as the causes are always more or less in operation, so the protective measures require to be carried out with corresponding vigilance. The so-called practical man, as is his wont, asks, "But will it pay?" He is right in making the enquiry. Fortunately, in this case there is no doubt whatever that operations such as we have spoken of are eventually highly remunerative.

OUR ALMANACK.—Secretaries of Societies and others, are earnestly requested to forward immediately, the dates of Show Fixtures and Meetings of Botanical and Horticultural Societies of any kind for 1894, for insertion in the Almanack, to be published in our issue for January 6.

CALPURNIA AUREA (fig. 115, p. 751).—This plant flowered for the first time at Kew in the spring of 1890, when it was noted in the *Gardeners' Chronicle* as a small tree, with the habit and flowers of the common Laburnum, and for which it passed with non-botanical people in Natal, of which country it is a native, and is now a favourite garden-tree in that colony. It grows freely, forming a graceful tree, and flowering irregularly under cultivation at Kew. In pots it is not very happy, but planted out in a large conservatory it is quite at home, even when not in flower, and it is attractive by reason of its elegant pinnate, deep green foliage. The racemes of yellow flowers are shorter, and therefore less elegant in appearance than those of the common Laburnum; still, they are more thickly placed on the raceme, and of a clear bright-yellow colour. In countries where severe frost is not experienced, this *Calpurnia* may prove a useful little tree for the park and garden. The accompanying figure was made from a plant which flowered last autumn in the Temperate-house at Kew, and is flowering there at the present time, flowering shoots from this plant having been shown at the Drill Hall on Tuesday last. Although many of the leaves fall off the plants at Kew in the winter, the plant is not deciduous. *Calpurnia* is a genus of eight species, all natives of South Africa, and closely related to *Sophora*. Perhaps Mr. MEDLEY WOOD, of Natal, would be kind enough to tell us more about this interesting tree.

LINNEAN SOCIETY.—On the occasion of the meeting held on Thursday, December 7, Professor STEWART, President, in the chair, Mr. A. Trevor Babye was admitted a Fellow of the Society; and the following were elected:—Messrs. J. H. Cooke, H. Cummins, R. E. Leach, C. Sharp, A. Smith, F. C. Smith, A. H. Teague, and H. L. Thompson. Mr. C. T. Drury exhibited and made remarks upon a new example of apospory in *Scolopendrium vulgare*; and Professor Bower brought forward a similar case in *Trichomanes Kaulfussii*. Mr. F. Enoch, with the aid of the oxy-hydrogen lantern, exhibited the various stages of development of the Black-Currant mite (*Phytopus ribis*), and gave an interesting account of its life-history. Mr. Thomas Christy exhibited a gigantic reed-like leaf from the Zambesi, with drawings of sections; it appeared to be allied to *Sansevieria cylindrica*, but differed conspicuously in the greater size of the leaves, which measured about 9 feet in length, instead of 18 inches to 3 feet. The remarkably tough and strong fibre which it produces is considered to be of great commercial value, being equal to the best *Sansevieria* Hemp. On behalf of Signor Martelli, the Secretary read a paper on "The Cause of the Fall of the Corolla in *Verbascum*," which gave rise to an interesting discussion. The meeting adjourned to December 21. With reference to the *Sansevieria* leaves above-mentioned, as being shown by Mr. Christy, the cylindrical reed-like leaves, about 9 feet in height, belong, without doubt, to a species of *Sansevieria*. As, however, only the leaves were present for examination, the exact species could not be determined. The internal structure of the leaf is most like that of *Sansevieria cylindrica*. One great difference from that variety is, however, the length of the leaves, as

all describers of this hitherto have given them as being from 18 inches to 3 feet long, whereas in this case they are 9 feet. A strong and very tough fibre runs through them, and is equal to the best quality of *Sansevieria bemp.* A full account, we believe, was published in the *Chemiker Zeitung.*

BOTANICAL MAGAZINE—The plants figured in the December number are:—

Amorphophallus oncophyllus, Prain, t. 7327.—A species with a solitary tri-pinnatisect stalked leaf, a spotted peduncle, a spathe the base of which wraps round the lower part of the spadix, and is of a dull,

greenhouse or half-hardy shrub, with "white flowers, changing to pale azure as they fade. See *Gardeners' Chronicle*, 1889, vol. ii., p. 156, f. 21.

Eria Meirax, N. E. Brown, t. 7329.—A very curious miniature Orchid, with small, depressed, subglobose pseudobulbs, like miniature *Crocuses*;

FIG. 115.—CALPURNIA AUREA: GREENHOUSE SHRUB; FLOWERS, GOLDEN YELLOW. (SEE P. 750.)

LINNEAN SOCIETY.—An evening meeting will be held on Thursday, December 21, at 8 P.M., when the following papers will be read: 1, "Enumeration of all Orchidæ hitherto Recorded from Borneo," by H. N. RIDLEY, F.L.S.; 2, "Hepaticæ collected by W. R. ELLIOTT in the islands of St. Vincent and Dominica," by R. SPRUCE, A.L.S.

livid colour, whilst the spreading portion is purple, with large green blotches. The spadix is stout, with an ivory-white, flame-shaped appendage. The plant is a native of the Andaman Islands, and though very handsome, its odour is noted as "the most vile of any of its notoriously evil-smelling congeners."

Abutilon vitifolium, t. 7328.—A very handsome

leaves oblong, lanceolate, about half an inch long, appearing after the flowers. The latter are red, about the same length as the leaves, regularly tubular, curved, with a limb of three regular, spreading, ovate-acute segments. It was originally described by Mr. N. E. Brown in the *Gardeners' Chronicle*, 1880, ii., p. 603. It is a native of Moulmein and Sikkim.

Eulophia Zeyheri, t. 7330.—A Natal species, with long, lanceolate, plicate leaves, and stalked clusters of primrose-yellow flowers, each about 3 inches across when expanded. The lip is three-lobed, the lateral lobes purplish, erect, the disc with two projecting keels, which end in little horn-like processes, and the spade-shaped front lobe studded with purplish hairs. Introduced by H. J. Elwes, Esq.

Protea rhodantha, Hook. f., t. 7331.—A handsome species, the seed of which was introduced to Kew by Mr. W. T. Hornio 1886. It only attained a height of 18 inches, when it flowered—a valuable feature. It is a shrub with oblong-linear leaves and terminal heads of crimson flowers, surrounded by numerous overlapping, oblong, crimson bracts. It is a native of the Transvaal.

"ORCHID REVIEW."—The December number of the *Orchid Review*, which completes the first volume, contains a chromo-lithograph of the new *Cypripedium Charlesworthii*, and a complete index. It is interesting to note that the volume now completed contains the origin and parentage of the numerous hybrid Orchids down to the present date, all of which can be readily consulted by means of the index.

GARDENERS' ORPHAN FUND.—We hear that the LORD MAYOR has undertaken to take the chair at the next anniversary festival of this excellent institution.

CHRYSANTHEMUM PRINCE OF NAPLES (Prinz von Neapel).—The *Gartenflora* has a coloured illustration of this new Anemone-flowered Japanese variety. The rays are rosy-lilac, spotted with white spots, which may find favour with some, but which to us seem suggestive of unpleasant associations!

ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.—The acting directors of this Society met in the Secretary's office on Monday evening, 11th inst., Mr. A. REBSON, Vice-chairman, presiding. As suggested by Sir ARTHUR GRANT, the chairman of the Society, it was resolved that a Congress should be held in Aberdeen on a date to be afterwards arranged, the Congress to be attended by representatives from the leading horticultural societies in Scotland, and the best steps to be taken for the advancement of horticulture and kindred subjects to be discussed. It was resolved, subject to the permission of the Town Council, to hold a summer exhibition on the Links on the occasion of the Highland and Agricultural Society's Show next summer, and that an autumn show be held in the month of September. It was also agreed that two medals be offered to gardeners for length of service.

MYRTLE BERRIES.—A correspondent from Sidmouth, Devon, sends branches of the common Myrtle laden with purple berries. Only once before during eighteen years have the berries been produced, and that was in 1887 (Jubilee year), when the summer was also a hot one.

ROMNEYA COULTERI, OR THE CALIFORNIAN POPPY.—This plant is not only suitable for outdoor culture, but we find it will well repay for the protection of an orchard or cool greenhouse. Cultivated in pots, it has rewarded us with an almost continuous supply of bloom, commencing in April and continuing, as you will see from the enclosed specimen, up to the present time, and we have secured a fine crop of seed. We note in some of the horticultural papers, it is thought by many that it will not withstand the severity of our climate; but we may mention that we have plants in our nurseries which have withstood the last four winters with the protection only of a little coke-dust, though we doubt not any other light material would answer the purpose equally well. *R. H. Vertigans & Co.*

STOCK-TAKING: NOVEMBER.—The returns of our trade for the month of November do not compare very favourably with those for the same period last year, the imports being less by 8½ per cent., and the exports by 5 per cent.; the fall being, on imports, £3,097,517, and the exports £743,466. The "navigation" side of the question shows a fall of

11 per cent. in the entries and clearances. And here we may just note, that the number of steamers employed in British trade is 5694 whose tonnage is in excess of 100 tons, the net tonnage being 5,886,621 tons; these figures being given on the authority of the last issue of the *Répertoire Générale de la Marine Marchande de Bureau Vérité*. The effects of the great coal war have been more felt in November than in previous months, and will doubtless be felt during the present month, though the great industries are again in full swing, with an air of uncertainty in the market relating to the ultimate settlement. The imports of wheat and flour from the United States during the past month fell off by nearly a million sterling compared with November of 1892; and the fate of the proposed WILSON Tariff in lieu of the MCKINLAY being somewhat dubious, trade is necessarily contracted. The annexed figures from the "Summary" table of the Returns before us will be of interest:—

IMPORTS.	1892.	1893.	Difference.
	£.	£.	£.
Total value for month	£38,898,373	£35,890,856	-3,097,517
§II.—(A.) Articles of food and drink—duty free	13,058,620	11,886,973	-1,171,647
(B.)—do., dutiable	2,818,758	2,581,746	-237,012
§VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute)...	8,913,754	7,932,702	-981,052
§VII.—Raw materials for sundry industries and manufactures (including wood and timber, hewn, sawn, split, dressed; vegetable materials, for paper-making, &c.)	3,562,296	3,299,044	-263,252
§IX.—Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ...	1,621,563	1,623,483	+4,920
(B.)—Parcel Post ...	28,983	41,902	+12,819

It is interesting to note that, whilst three-fourths of the exports from the United States are of agricultural produce, we in this country take over three-quarters of that grand total. There is a rising market in America for food-stuffs, hence merchants are holding, whilst Russia is sending us more than usual. It is also interesting to note here that accounts from Egypt are all round of a highly encouraging nature, though those from Italy and Spain might be very much better. The following figures respecting our imports of fruit, roots, and vegetables maintain the interest in this section of the Returns always evinced by readers of this journal:—

IMPORTS.	1892.	1893.	Difference.
Fruits, raw:—			
Apples bush.	901,959	602,210	-299,749
Cherries "	—	—	—
Plums "	—	2	+2
Pears "	19,268	43,170	+23,902
Grapes "	99,012	173,971	+74,959
Unenumerated "	29,584	36,051	+6,467
Onions "	446,711	419,275	-27,436
Potatoes cwt.	493,103	49,295	-353,808
Vegetables, unenumerated, raw, ... value	£62,912	£52,298	-£10,614

As a "sign of the times" in the matter of imports of food products from our colonies, we may note the placing on the New Zealand and Australian line of a new steamer, next in size to the once-famous *Great Eastern*. The cargo capacity of the twin-screw *Gothic* is simply enormous, and dairy-farmers and fruit-growers at the Antipodes will doubtless hail with delight the first appearance of this last product of Irish industrial enterprise.

THE EXPORTS

for November, as above noted, show a falling off to the amount of 5 per cent. compared with those for November, 1892. This, and even more, was to be expected as a result, partly of the coal war and of the uncertainties in connection with the proposed

new American Tariff. Mr. WILSON and those acting with him, including President CLEVELAND, are quite aware of the fact that it is the purchaser, not the vendor, who pays the customs dues on all imported goods; and a good many Americans are tired of being thus mulcted to foot up the bill of an extravagant expenditure—the United States Budget showing a large deficit—the first for many years. Liberal as is the Wilson Tariff, it does not quite throw down the barrier of protection, but if passed, it will be productive of much good at home as well as to the hampered agriculturist in the States furthest removed from the Atlantic seaboard. The export of heavy goods and minerals have been much affected by the strife in the coal trade; should peace be assured in this direction, an all round improvement may have to be noted in the returns for December.

THE REIGATE AND DISTRICT CHRYSANTHEMUM SOCIETY.—This Society has, as we are informed by Mr. HARRY BAILEY of The Briars, Reigate, accomplished another year's useful work in connection with gardening charities, for in addition to the 30 guineas given to the Gardeners' Royal Benevolent Institution, as announced in our last week's issue, they have also handed £20 to the Royal Gardeners' Orphan Fund. Apart from this, the committee are enabled to offer a substantial prize-list, and the spirited competition which ensues is a further proof not only of the good work the Society is doing financially, but the increased number of growers of queen-of-winter flowers. The indefatigable Hon. Secretary, Mr. J. BROWN, backed up by a hard-working committee, deserve great praise, for during the five years the Society has been established, no less a sum than £299 10s. has been given to charities.

THE ORCHIDÉENNE.—At the meeting on the 10th inst., there were fourteen exhibitors and fifty Orchids, besides a collection of fifty specimens of *Cypripedium insigne montanum*. H.M. the King of the BELGIANS sent from Laeken an inflorescence of *Cattleya labiata* Warocqueana, with six superb flowers. A Certificate "de belle floraison" was awarded by acclamation. Certificates of Honour were awarded to M. LINDEN, for the following plants:—*Lælio-Cattleya Stechegolowiana* (!), a presumed natural hybrid between *C. grandis* and *C. labiata*, the segments are lilac, and the lip of an intense purple; 2, *C. Lowii* × *Parishii*, with the petals of *Lowii*, and the standard of *Parishii*; *Cypripedium villosum* × *Harrisoni* gained an Award for M. ENGEN POURBAIX. Mr. Alfred van Imshoot obtained a Certificate for *Lycaste Luciani* and *L. Imshootiana* [both of which were also exhibited at the meeting of the Royal Horticultural Society on Tuesday last]. First-class Certificates were awarded to M. LINDEN, for *Odontoglossum crispum amplissimum*, with a spike of sixteen flowers, with petals and lip of milk-white; also for *Cypripedium insigne montanum*, with the standard snow-white; *Stenia fimbriata*, with a lip as of tissue paper; *Cypripedium bellatulum magnificum*, with very large flowers and deeply coloured spots. Mr. Van Imshoot obtained a like award for *Lycaste Skinneri alba*, a pure white flower; and for *Cypripedium selligerum superbum*, *Ocuidium Phalaenopsis* var. *Imshootiana* and *Restrepia antennifera* var. *striata*. M. Ed. Vervæet showed *Odontoglossum sulphureum* (First-class Certificate). Mr. Van Wambeke received the same award for *Cypripedium selligerum*. *Odontoglossum crispum*, a fine variety, secured like honour for the Comte de Bousies. Similar Certificates were awarded to M. de Moorloze, for fine forms of *Cattleya labiata* and *Odontoglossum crispum*; to Dr. Van Canwelaere, for *Cattleya labiata*, with deeply coloured petals, edged with white; to M. de Lansberghe, for *Odontoglossum trifidians*. Second-class Certificates were awarded to Aganisia ionoptera, from M. Linden; to *Odontoglossum Pescatorei* from M. Ed. Vervæet. Botanical Certificates were awarded to a species of *Catasetum* undetermined, and to a new species of *Maxillaria* from Peru, both shown by M. Linden.

THE CHISLEHURST AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.—On Tuesday last, the President of the above Association, Mr. J. LYNE, read a paper, entitled "The Drought of 1893." In the discussion which followed, the fact was mentioned that, on one occasion at least 143° of heat were registered in Chislehurst, the average temperature for that locality during the summer being from 108° to 115°. It was also mentioned as a curious effect of the drought that about 80 per cent. of the Potatoes planted by Mr. LYNE could not break through the soil, which was of a clayey nature, and had been literally baked by the heat. The ravages of green-fly and red-spider had interfered greatly with the crops, making it difficult to preserve a decent quantity. Mr. BUSHBY of Croydon contributed the information that in Surrey the drought had penetrated to a depth of 15 feet, and that at the present time the rain had hardly gone in 2 inches.

THE DUTCH AMBASSADOR.—We learn that Baron de GOLDSTEIN, the newly-appointed Ambassador to this country, is the President of the Royal Netherlands Horticultural Society.

ROYAL GARDENERS' ORPHAN FUND.—The Rugby and District Chrysanthemum Fruit and Floricultural Society was enabled to give to the above Fund the sum of £6 17s. 8d., realised by the sale of Chrysanthemum and other flowers, fruit, &c., on the occasion of their last exhibition, and is desirous of expressing its thanks to those who so kindly contributed to that end.

FIG. 116.—THE "KNOWSLEY" SNOW PLOUGH.

ADJUSTABLE SNOW-PLOUGH.

THE "Knowsley" Snow-plough, for being enabled to figure which we are indebted to Mr. Harrison of Knowsley Gardens, is, as will be seen by the figure, an adjustable machine, and can be readily fixed to suit various widths of road up to about 12 feet. There is a slightly projecting plate of iron fixed to the bottom edge of each of the side-pieces, which act like a share in cutting the snow up from the ground, and a pair of iron "skates" fixed in the line of draught, and secured to the shafts and front part, prevents the possibility of the implement refusing to act when it happens to get into a deep drift, and, as a further aid to that end, the power is applied, that is, the horse is hooked on, not at the extreme nose end as is usually done, but a little further back. The draught of the new implement is much lighter than that of the old pattern of snow-plough. The plough is shown in the illustration (fig. 116), with one side extended to the full width and the other drawn in.

HOME CORRESPONDENCE.

BELGIAN AND ENGLISH GARDENERS.—If Mr. Watson and Mr. Burbidge think proper to air their patriotism and their spirit of confraternity, they might choose a better means than by distorting (*dénaturer*) my remarks on the subject of English gardeners. I refer to the exact terms of an article published in the *Journal des Orchidées* on October 15, p. 432, the translation of which in the *Gardeners' Chronicle* is open to slight corrections, but which cannot, in any way, be considered as "ill-considered" or unfavourable to English gardeners. Before

COUNTY COUNCIL HORTICULTURE IN NORFOLK.—Of the varied forms of technical education now being carried out in Norfolk under the auspices of the Technical Education Committee of the C. C., none is more popular, or affording more general satisfaction than that treating of horticulture. The services of Mr. W. K. WOODCOCK, the C. C. lecturer, are being much sought after in all parts of the county, and the average attendances at the lectures is much better than was the case a year ago. During the mid-day hours also Mr. WOODCOCK gives outdoor demonstrations in pruning and the general treatment of fruit trees, and these are very popular, being largely attended by cottage gardeners; and much good is expected to result from these lectures.

PANICUM PLICATUM.—We learn that there is a fine plant of this species, some 11 feet in height, in one of the houses of the Botanic Garden at Utrecht. Last summer the plant was grown in the open air with a fine effect.

PUBLICATIONS RECEIVED.—*Index Kewensis*, fasc. ii., pp. 72s to 1263 (De to Jus); *Les Orchidées*, M. Georges Mantin; *Kew Bulletin*, Appendix I (list of Seeds, &c.); *Agricultural Journal of the Cape Colony*; *Brazil, State of Para, State of Ceara*.—(Reports in Connection with the Chicago Exhibition). *Proceedings of the Agri-Horticultural Society of India*; *Pharmaceutical Journal*; *Flora of Somerset*, Part I, Rev. R. P. Murray; *North Carolina State Horticultural Society*; *Tropical Agriculturist*; *Moniteur d'Horticulture*; *Der Anatomische Bau der Laubblätter der Helleboreen*, Dr. A. Nestler; *Grundzüge einer Vergleichenden Anatomie der Blumenblätter*, von Luise Miller; *The Flora of the Assyrian Monuments*, by D. E. Bonavia, M.D. (Westminster: Archibald, Constable & Co.).

writing my cultural notes I desire to make this fact quite clear. Before concluding, I should like to ask Mr. Burbidge whether and when he has seen the cultivation of Orchids at M. Waroqué's at Mariemont, or at Messrs. Lindens' at Brussels? *L. Linden*. [It is not desirable to prolong this correspondence. There is no question but that there are excellent cultivators in both countries, that circumstances differ in each, and that each may learn from the other. "To see ourselves as others see us" is, moreover, frequently salutary. Ed.]

DAMAGE TO TREES AT DROPMORE.—On Tuesday, December 12, we experienced a south-west gale of unusual severity, doing considerable damage to trees. The wind was roughest between 4 and 5 o'clock, P.M., when several branches were twisted off our large Douglas Fir, and three Cedars in the avenue were blown over, and the tops taken out of several others. Several Spruce Firs and Beech trees have also been uprooted. The wind was accompanied by heavy rain. This morning there is a renewal of the gale, with a very high temperature (53°). *C. Herrin, Dropmore, Dec. 13.*

CARNATION MRS. LEOPOLD DE ROTHSCHILD.—If I rightly understood the action of the judges who had to examine the new flowers submitted for Certificates at the recent Crystal Palace Chrysanthemum Show, they passed over a vase of blooms of the above Carnation because they were as they thought a little weak in the stem, and because they had no plant to enable them to judge of its merits; but they gave a Certificate to a white variety, also shown as cut blooms, on the ground that it was a stronger grower. Mrs. Leopold de Rothschild somewhat follows the character of Miss Joliffe, which without danger of being considered a weakly grower, is small in the foliage; it grows to a medium height, the habit is very free and bushy. The shoots send

up blossoms on erect stems, and it is so persistent in flowering that it may be rightly termed perpetual. About six weeks ago, when at Gunnersbury Park, Acton, I saw a house of between 200 and 300 plants of this variety, some a year old in 6-inch pots, and some two or three years old in much larger pots. Not only was the healthy and free character of the plants noticeable, but the head of bloom was somewhat astonishing, and the flowers were so great and well displayed. The blossoms are sweetly fragrant—that is a decided advantage, so many Carnations of otherwise good properties not possessing this quality. The flowers open as delicate pink, and as they age they become pinkish-rose without in the least losing any of their beauty; and it is only the older flowers that appear to split their calyx, though there was a marked absence of this defect among the flowers seen at Gunnersbury Park. Cuttings strike readily, and therefore it is a very useful nurseryman's plant, and it is in my opinion one of the very best to grow for cutting and market work. Had I been called in to make an award to it as a new variety I should have given it a double First-class with my knowledge of the variety and its excellent qualities. Probably, Messrs. Cutbush & Son, of the Highgate Nurseries, who exhibited the flowers, cut them from a plant grown in a little warmth, and therefore a little drawn. *R. Dean, Ealing, W.*

DO CYPRIPEDIUMS SPORT?—When speaking to Mr. R. H. Measures, of Streatham, a few days ago, he put the above question to me, and suggested that it would make an interesting topic for those concerned in the cultivation of Cypripedes. Mr. Measures is not only of opinion that Cypripedes do sport, but he has a plant in his collection which is varying continually in its form of flowering. This plant is *Cypripedium* × *Dauthierii*, The Albino, a plant of which is also possessed by Sir Trevor Lawrence, Bart. The ordinary *C. Dauthierii* is a hybrid between *C. barbatum* × *villosum*, and may be best described as a pale form of *C. Harrisonianum*, the latter being the reverse cross. The origin of The Albino I do not know; suffice it to say, that it is to *Dauthierii* what *Sanderæ* is to *insigne*. Mr. Measures' observations reveal the fact that at one season of flowering The Albino is not an Albino at all, but a *Dauthierii* pure and simple; while at the next time of flowering it reverts to its other character, and is once again The Albino, thus giving a representation in still life of Dr. Jekyll and Mr. Hyde. Another curious phenomenon which this plant presents, is a habit which it has of sending up suckers from the roots, and which at a glance look like numerous seedlings growing up. Mr. Measures could not quite understand these vagaries, and turned the plant out of its pot for examination, expecting, of course, to find that the plant consisted of two varieties; it was found, however, that the plant was entire, and each growth was traced in succession upon the rhizome. It will be interesting to hear if other hybrids, or species for that matter, are addicted to the same peculiarities. *Cattleyas* which have been pure white one year will sometimes flower the following year with a decided rose tint. Can this also be called "sporting?" *P. W.*

NON KEEPING OF APPLES AND PEARS.—Mr. Cook's experience of the very indifferent keeping qualities of these fruits, noted in a recent issue of the *Gardeners' Chronicle*, this season, is exactly that of many others, and it seems absolutely certain that our usual good supplies of home-grown fruits will by Christmas be unusually small. I was the other day reading some observations of Mr. Meehan with respect to the impossibility of growing good Apples in certain of the hot districts of America, and he pointed out that the Apple is essentially a cool-climate-loving fruit. We have had a season of exceptional heat and drought, with the result that we have had the finest Apples and Pears probably ever seen. A few weeks ago we rejoiced, were, in fact, very proud, that Great Britain had produced such grand, perfect samples. Now we rather regret what has happened, as it is found that our magnificent fruits are thin of tissue, devoid of juice, puffed up, as it were, by the great heat, and yet attenuated by reason of the great drought. We have had another lesson of the non-value of mere size in fruit products, as compared with that sterling solidity and excellence as well as endurance that come from ordinarily slow growth, and in which root moisture plays an important part. If we had experienced but occasional rains, we should have had less of sun-heat, cooler atmosphere, and sap flow in abundance.

The season has been such an abnormal one, so erratic, and sometimes so novel in its results, that we may not regard it as at all indicative of what will be the nature or condition of our fruit crops in future years. It is a good thing for us that the trees so early relieved of their fruit did not, like Strawberry plants in some districts, feel the effects of the autumn rains at the roots, so as to induce a new sap-flow, and an outbreak of flower-buds—that would have been a disaster. As it is, the moisture has helped to plump up the bloom-buds on all fruit trees, and we may look next year for normal crops with some natural anticipations. *A. D.*

EXPANDING SHOW BOARDS FOR CHRYSANTHEMUMS.—In the *Gardeners' Chronicle* for December 3, 1893, p. 727, you refer to an "Expanding Show-board" for Chrysanthemums, exhibited by Messrs. Cannell & Sons, of Swanley, at the meeting of the Floral Committee of the National Chrysanthemum Society on December 5, which you state that a patent has been applied for. In submitting this board to the committee, Messrs. Cannell, by some inadvertence, omitted to acknowledge the fact that, in all essential respects, the show-board put forward as "Cannell's Expansion Board," was but a copy of the expanding board submitted by me to the Floral Committee of the Royal Horticultural Society on November 14 last, which board came under the notice of Mr. H. Cannell, in his capacity of a member of that committee. Messrs. Cannell had my written consent to use this board, but an acknowledgment of the source of the invention would not have been altogether out of place. I need scarcely add, that no patent not obtained by the "first and true inventor" would be worth the paper or parchment it was written on. *Charles E. Shea, The Elms, Foots Cray, Kent, December 11, 1893.*

COLOURED FOLIAGE.—I read the notes on the colour of foliage in autumn, which appeared in your issue of December 9, with much interest, but may I be allowed to say, that most of the gorgeous tints there mentioned may be enjoyed in our gardens during many months of the year, of course I mean by planting those trees and shrubs that possess varied and beautiful tinted and coloured foliage. It has been to me for many years a matter of astonishment that such has not been the practice. Among our trees we have golds, purples, silvers, bronzes, light green, dark green, almost black, and many forms of variegation, and with these, and a little careful consideration, lovely, and for months permanent, combination of colour and form may easily be produced. I am now only writing of the deciduous trees, &c., but there are numerous hardy evergreens that may also be used, or a mixture of both. This last, however, requires more skill to manage properly. Of the first, where beautiful and vivid grouping of colour can be produced from the Elder alone, we have the golden-tipped, the golden variegated, and the silver, the useful silver-spotted or grey, the green and the scarlet-berried variety, and the dark green cut-leaved, light in form and elegant all of them. With these plant the *Prunus Pissardii* with its crimson leaves, and in spring its lovely blossom; the sheen on the *Acers*, in many colours; the *Negundo alba variegata*, or its twin in all but the glowing yellow, the variety "suea variegata." There are also the finely brilliant forms of the Japanese *Acers*. How lovely all these are! The golden-leaved *Laburnum*, the golden-leaved *Lilac*, the golden-leaved *Weigela*, and many others, then and there all tend to brighten and enrich the whole garden when judiciously used, and several of these are good autumnal "colourers" also. Then why, I ask, are they not more sought for and used? Why are not such permanent garden effects more enjoyed? I have planted nearly all the above and several others with much satisfaction to myself if to no one else. I have also made some groups of "colour" by the aid of the gold, the silver, and other variegated *Hollies*, mixed with *Yews*, as a dark green, with the blue, grey, and gold varieties of *Lawsoniana* or *Young's Golden Juniper*. Then there are numbers of *Ferns* as greens, and many coloured grasses. I hope I am not taking too much of your valuable space by thus briefly calling attention to what I believe is a neglected Art in gardening, this arrangement of coloured foliage, with or without floral decorations intermixed. *Harrison Weir, Srevoaks.*

—None of your correspondents have named the *Salisburya* as to colour of foliage on p. 718. Miss Marianne North considered it the most beautiful of all trees for autumnal tints, and this year the

colour is a lovely pale gold, which continues long after the leaves have fallen on the grass. In a wet season, or with early frosts, the beauty is not seen; but this year it has been most beautiful. Some of the species of *Vines* also have been marvellous in their tints. *E., Bitton.*

THE TRADE IN CHRISTMAS TREES.—Whilst on a business call at Messrs. Fromow & Sons' nursery establishment at Turnham Green, just recently, I was struck with the very extensive stock of the common Spruce of all sizes, from quite pigmy plants up to handsome specimens of 10 and 12 feet in height. I was curious to know the number of these Christmas trees which passed through their hands, chiefly into London and the suburbs, during this festive season. Judge of my astonishment when I was told that 20,000 was approximately the amount which they cleared. I was quite prepared to hear Mr. Joseph Fromow state 5000 as about the number sold, but the larger number was altogether a surprise. In one block stood, I should think, quite a thousand of small neat trees 2 to 3 feet in height, all potted up ready for delivery. Many of the larger ones had quite sufficient roots to have ensured their safe removal for transplanting with ordinary care and attention. Thinking of this large number of trees for Christmas festivities, afterwards my thoughts dwelt on the still larger number of children (and older people, too), who would derive a deal of pleasure and innocent amusement wherever these decorated trees form the most important feature in many an evening entertainment. The only possible regret could be that the vast majority of these trees would be dead in a few weeks time, instead of thriving later as ornaments in the landscape. *H.*

HEELING-IN BROCCOLI.—In the county of Kent at a distance from the sea, Broccoli of all varieties suffer more or less from frost if the winter be severe, hence heeling-in becomes a necessity. It is my practice to begin this operation in the month of November, carrying it on when the land is not in a sticky condition into December. It is easily done by taking a few spadeful of soil at the end of a row of plants, and bending the first plant down to an angle of 50°, taking up the soil behind the next one and throwing it down on the stem so as to keep that plant in the position it has been laid, pressing the soil firmly over and around the stem. If the Broccoli is to be lifted up with good balls of soil, this is done with the early varieties; they should be dug and planted the head facing north on a sheltered border. The plants as taken up require but small space, and the ground previously occupied by them may be prepared for other crops. The varieties which are found to do well are Knight's Protecting, Goehen, and Ledsham Latest, not the hardiest, but one of the best flavoured varieties of Broccoli; *Victoria* and *Model*—these are the latest. For early use, *Snow's Winter White*, *Osborn's ditto*, *Walcheren*, *Early Penzance* (a small grower of upright habit), *Veitch's Self Protecting*, these are early varieties that should be lifted so soon as the curd shows itself. *H. Markham, Mereworth Castle.*

PEACH AND NECTARINE LIFTING.—It is generally recognised that the month of November is the best month in the year for lifting and replanting the above, but it may be carried on, if necessary, in the present month, provided the weather is not in any degree frosty. The subject of root-pruning of young orchard trees has been much discussed in these pages recently, and many gardeners seem agreed that, if these trees are well planted at first, and are afforded plenty of head room, they rarely require their roots to be cut off or pruned, unless growth be strong and coarse, or the trees be not fruitful. The roots must then be dealt with. There is, however, a great difference between orchard trees and Peaches on a wall. These are sometimes planted too close together, more perhaps for variety's sake, or the clothing of the wall quickly. However, be that as it may, when space is limited, if growing in rich soil, the wood will soon become too rank for good fruiting, and root-pruning or replanting must be resorted to. The latter method is to be preferred, as by it the deep-seated roots may be brought near to the surface and spread out, and the danger of roots striking downwards averted for several years. There is scarcely a limit to the size of a tree that may be replanted, provided due care be taken, be it a Peach, Plum, &c., and the trees generally set a lot of bloom-buds the following season, and unfruitful trees rarely fail to fruit the second year. Always begin to take up or root-prune a tree by throwing out

a trench 2 feet wide at fully 5 or 6 feet away from the main stem of large trees, and at proportionally less distance for small ones, and this trench should be kept clear of soil, and fully 2 feet in depth. Having done this, first remove the surface-soil down to the roots nearest the top, gradually removing bit by bit, and then undermine, always using a fork, and work inwards towards the tree. Any roots that have gone downwards should, if they cannot be dug up without great labour, be severed, carefully preserving and tying in damp straw all others. It is a job that does not admit of hurry, as the roots are brittle and easily broken. Having prepared the future station of the tree, spread out the roots at various depths, after pruning away damaged parts and suckers, being careful not to put the root-stock nearer the foot of the wall than 7 or 8 inches. If the border is not a new one, lime rubbish, old plaster, and some small quantity of rotten manure may be added to the staple. Never plant on a loose bottom, or allow the soil overlying the roots to be other than firm. A mulching should be placed over the roots. As all soil, however firm, sinks during the winter, no transplanted tree should be nailed or otherwise fastened to the wall before March, except by placing some string across it in several directions merely with the idea of keeping it in place. I have shifted very large trees of Plums with good results, but the work should be done, if possible, as soon as the leaves begin to fall, and the following season the soil should have a renewing of the mulching, and be watered abundantly early in the season, for should the soil get dry, the trees would get a check from drought and give but scanty crops that season. *H. Markham, Mereworth Castle, Maidstone.*

POINSETTIA AND OTHER PLANTS AT GRIMSTON PARK, YORKSHIRE.—Among the beautiful things to be observed in the gardens of the Grimston Park, not the least are the plants of *Poinsettia pulcherrima*, between two and three hundred in number, and ranging from 6 inches to 4½ feet in height; the heads of bracts of many of these plants measure 14 inches across. The plants were disposed among and backed up with *Adiantums* and other Ferns, the group being edged with *Euphorbia jacquiniæflora* and *Calanthe Veitchii*. *Eucharis amazonica* is another plant which is well done at Grimston; it is planted out in boxes of slate, and these fine specimens are at present flowering freely. The gardens at Grimston have always much to interest a gardener, well managed as they are by Mr. John Clayton. *Paxtonian.*

BELGIAN ORCHID GROWING.—In reply to "W. H. B.'s" inquiry concerning Belgian Orchid compost, I give below a description of the material used by one of the largest and most successful growers in Belgium. Instead of peat, as used in England, the fibrous roots of *Polypodium vulgare*, a Fern indigenous to Great Britain and the northern part of the Continent, are employed. The lumps are brought in from the woods and dried, all thick roots being first removed, and when dry, the finer part is more or less carefully extracted by sifting it in a fine meshed sieve, taking into consideration whether the plants to be potted are of a terrestrial or epiphytial nature. When so far prepared, the roots, roughly cut up with a chopper, are then ready for being mixed with moss. The latter is chiefly of the variety with large heads. After being picked in the usual way, it is likewise chopped up and mixed in an equal quantity of fibre, as far as *Odontoglossums*, *Lycaste*, and similar sorts are concerned; but a smaller quantity is used for *Cattleya*, *Lælia*, &c. The superiority of this kind of compost consists in its greater durability; it is, therefore, less liable to turn sour, and the plants may remain for a longer period in their pots undisturbed, to the evident benefit of their roots and general condition. Silver sand, charcoal, and loam are rarely, if ever used. *H. H.*

EARL'S COURT PRIZE MONEY.—I think the time has come when all those exhibitors who have not received the prize money awarded to them at the series of Earl's Court shows should take concerted action in the matter. It appears to me that the best course to adopt is to take proceedings against the officials as a means of bringing matters to a head. I am far from being desirous that any annoyance should be caused these gentlemen, but as many exhibitors were put to considerable personal expense in conveying their exhibits to and from the shows, they should be reimbursed the outlay. Some of them can ill afford any loss. I would suggest that a meeting of exhibitors be called, and some course decided upon. As the matter at present stands, it is

little better than a grave scandal. If there is a prospect of the money being paid, let as much be said to allay alarm; if there is not, then I think there is cause for immediate action being taken. *A Sufferer*. [It has been publicly stated that the illness of one of the officials is the cause of the delay. ED.]

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

NOVEMBER 28—Present: Dr. M. T. Masters (in the chair), Prof. Church, Mr. McLachlan, Mr. Bunyard, Rev. W. Wilks, Dr. Bonavia, and Rev. G. Henslow (Hon. Sec.).

rarely now seen. The present tree is eighty years old, but never fruited before. Dr. Church observed that being closely allied to *Theobroma cacao* or *Chocolate*, it would be interesting to examine the seeds for theobromine.

Primula capitata and *Basal Rot in Daffodils*.—The following communication was received from Rev. C. Wolley Dod, Edge Hall: "I have been engaged for several years in investigating that mysterious phenomenon, basal rot in Daffodils. The Scientific Committee have assured me (after repeated examination of bulbs sent by me) that no specific cause of it can be detected. I am enquiring whether there is anything analogous to it in any other plants—viz., death from general unsuitable conditions, commencing at the juncture between the root and the bud, and producing decay there, partial or entire. I have noticed something similar in some Himalayan Primrosea, especially *Primula Stuarti*, which I have ceased to

growing on *Jasminum revolutum*, was received from Mr. F. W. Barbridge, of the Trinity College Botanic Gardens, Dublin. He observes that "it does nearly as well on *Forsythia viridissima* and *F. suspensa*, as well as on Ivy. Indoors in a warm house, *Pelargoniums*, *Fuchsias*, and *Crotons* seem to suit it best. We had it growing on a zonal *Pelargonium* which was placed in the *Jasmine* on a west wall last May, and it now forms a wiry net-like mass 10 feet high and 8 feet wide. It often twists upon itself." An examination of the suckers or haustoria showed that the *Cuscuta* often preyed upon itself whenever two branches were spirally twisted together. As far as a few observations can be trusted, the roots of the thicker of the two stems always penetrated the other. It frequently fixed itself to the surface of the leaves of the *Jasmine* as well as around the stems and petioles.

Preserving Fresh Fruit in Carbonic Acid Gas.—The following communication was received from Mr. W. Sykes, of Woodleigh, East Dulwich, being a description of experiments suggested at a meeting of the Scientific Committee on July 25:—"On August 23 I put down some Apples, Pears, Plums, Tomatos, and eggs, but am sorry to say that, so far, my experiments with carbonic acid gas are unsatisfactory. It does not appear to check the ripening or decomposition, and it gives the fruit a peculiar flavour. The Apples have a musty, coddled taste. With the Plums the gas centres round the stones. In the Tomatos there is a sharp, forbidding, pungent taste throughout, which leaves them after standing twenty-four hours in the air. I allowed the gas to pass through the washing-bottle into the tins, the natural air escaping through a pipe. After the fresh air had escaped (tested with a lighted match), I closed the latter pipe and let the gas work itself dead slow. After giving them all a good application (three dozen taking in both applications some six hours) I went through them again, opening the escape-pipe mentioned above to scour out, then I reclosed it with pliers before closing the entrance-pipe, the gas had worked dead slow, the top and bottom bulging out. The pressure at the gauge stood at 5 lb. The water in the washing-bottle was fresh boiled and put into the washer (just bearable), being changed for every dozen tins. I did not exhaust the air, and found with this test of a week that the Tomatos were sweating equal to those kept for over a fortnight after the air was exhausted. Some *Coreopsis*, white *Marguerites*, and *Nasturtiums* were put under the same process (August 23). The first kept well, and after being in water looked none the worse; the white of the *Marguerites* turned to a pale chocolate beyond recovery, and the *Nasturtiums* collapsed into a withered heap." Professor Church observed that the failure might have been due to an insufficient time having been allowed for the atmospheric air to diffuse. He added that much carbonic acid had been proved to exist around Mangold roots when turfed over, which undoubtedly acted as a preservative.

FIG. 117.—GENECIO MACROLOSSUS: LEAVES, DEEP GREEN, GLOSSY; FLOWERS, YELLOW. (SEE P. 756.)

Pears and Fungicides.—With reference to the remedies suggested by Mr. Massee, Dr. Masters inquired of Mr. Bunyard as to his experience in their use. He replied that growers were frequently deterred from employing any poisonous preparations in consequence of the carelessness of the men from their want of realising the dangers involved in using them, so that they preferred to employ sulphur, and especially the "black" or impure sort.

Tamarix dimorphic.—Mr. Henslow remarked that the two species common in Egypt, *T. articulata* and *T. nilotica*, corresponded with the two forms of *Casuarina* exhibited by Dr. Masters at the last meeting, who observed that *T. gallica* not infrequently develops the two forms on the same plant.

Sterculia nobilis, R. Br.—A fruiting specimen of this plant was received from Syon House. A synonym is *Southwellia nobilis*, of Salisbury's *Paradisus Londinensis*. It has been known to fruit in this country, but Dr. Masters observed that it is

cultivate because the base of the bud (I use bud in its botanical sense of crown from which the leaves sprout) is so apt to rot into pulp. In *P. capitata*, however, of which I have grown and flowered thousands during the last fifteen years, no winter bud is ever formed. Mr. G. Wilson tells me that in his garden at Wisley it is a hardy perennial, but with me it invariably dies if left out in winter. The tissues are not destroyed by hard frosts, for after a hard winter the leaves in the centre of the tuft often continue green in February, but rot seems to commence at the base, as in the specimens enclosed, and the open leaf-tuft invariably rots off before spring, being often still green. I should be glad of an opinion whether the case is likely to be analogous to that of basal rot in Daffodils?" Mr. Wilks corroborated Mr. Dod's experience, as he found the plants died in a similar manner in his garden. The specimen was forwarded to Kew for examination.

Cuscuta reflexa.—A specimen of this parasite,

DECEMBER 12.—Considering the lateness of the season, the meeting in the Drill Hall, James Street, Westminster, presented some interesting features. Orchids being numerous and in many cases of rarity, and the display of *Chrysanthemums*, *Ferns*, foliage plants, and fruit well represented.

Floral Committee.

Present: J. Marshall, Esq., in the chair; and Messrs. J. Laing, J. Walker, G. Gordon, G. Paul, R. Owen, H. Herbst, R. Deao, H. B. May, C. F. Bause, E. Stevens, F. Ross, C. J. Jeffries, F. Barr, T. W. Girdlestone, J. D. Pawle, W. Furze, W. Bain, T. Godfrey, T. Baines, C. E. Shea, H. H. D'Ombrian, C. Noble, J. Bennett-Poë, and W. Watson.

A group of choice and well-grown Ferns was contributed by Mr. H. B. May, Edmonton, including *Pleopeltis fossa*, *Pteris tremula denae*, *Polypodium angustatum*, *Acrostichum irioides*, *Polypodium nigrescens*. The last named is an extremely interesting Fern, from the nest in which the spores are produced, resembling impressions caused by a punch. There was also a first class specimen of *Platycerium aethiopicum (stemmaria)*, having fronds—which are divided towards the end into two lobes—nearly 3 feet long (First-class Certificate) (Silver Flora Medal).

Messrs. Hugh Low & Co., Bush Hill Nurseries, Enfield, again staged a large group of well-flowered *Cyclamens* (Silver Flora Medal).

A pretty group of miscellaneous plants came from Messrs. John Laing & Sons, Forest Hill, S.E., but they suffered from being placed in a dark part of the Hall. There were well-grown *Dacrydium*, including

the useful and prettily-variegated narrow leaved *D. Doucettii*, a number of well-flowered plants of *Odontoglossum grande*, some *Cyclamens* in flower, *Pavetta borbonica*, *Nicotiana colosea* variegata, and a plant of *Manettia bicolor* (Silver Flora Medal).

Sir Trevor Lawrence, Bart., Burford Lodge, Dorking (gr., Mr. Bain), again showed *Primula Forbesii*, also some sprays of *Costus igneus* bearing their orange scarlet flowers about 2 inches across (First-class Certificate). A Botanical Certificate was awarded to *Massonia amygdalina* from the same exhibitor. This is a new species, and its small white flowers are highly perfum-d.

Mr. H. Balderson, Hemel Hempstead, had *Primula sinensis* variety called Henry Balderson.

Messrs. Jas. Veitch and Sons, Chelsea, staged a number of *Nepenthes* with good pitchers. *N. Ameyana* from *N. Rafflesiana* × *N. Hookeriana*, was awarded a First-class Certificate; the pitcher is green and marked prettily with red. Others included were *N. Chelsonii*, *N. Curtisii* *superba* with dark coloured long pitchers. *N. Burkei* *excellens*, a magnificent pitcher with intense purple mouth; and the narrow-pitched *N. cincta* (Silver Flora Medal).

A very interesting collection of flowers, for the most part old neglected plants of our greenhouses, was sent by the Director of the Royal Gardens, Kew. *Brownea Crawfordii* from *B. grandiceps* × *B. macrophylla*, has an immense corymb of flowers of soft crimson, with very prominent anthers of the same colour; *Manettia bicolor* is an old plant from South America, of twining habit, with small leaves and tubular flowers of scarlet, tipped with yellow. This is an old inmate of the greenhouse, but now neglected. *Bomaria oligantha* has tubular flowers of orange-scarlet with orange tips; *Thunbergia* (*Hexacentris mysorensis* is another old plant, and bears most handsome flowers of rich bronze and yellow, arranged in racemes. *Senecio macroglossus*, or the Cape Ivy, see fig. 117, is a flower of pale yellow colour, profusely produced on the young wood; it bears some resemblance to a single flowered *Chrysanthemum*. *Calpurnia aurea* (the Natal Laburnum (see fig. 115), is described fully in another column. *Bomaria Patavensis* was exhibited as a good corymb of striking orange-crimson flowers. All of these plants flowering in mid-winter are well worth the attention of gardeners.

Mr. Robert Owen, nurseryman, Maidenhead, sent a wonderfully fine collection of *Chrysanthemums* for the season of the year.

At the back was a line of twenty-seven bottles, each containing three fine blooms, and in front of these were ten show boards, each containing twelve blooms, the incurved varieties being by themselves; the incurved Japanese were also together, and the varieties with spreading florets. A considerable proportion of these were seedlings raised by Mr. Owen. The collection well deserved the Silver Flora Medal it received. Awards of Merit were made to Mr. Owen for Japanese Mrs. Marian Bourne, a large and full incurved flower, the colour lilac-pink, with a silvery reverse, but not particularly novel in colour. It is likely to be useful for exhibition purposes.

Good Gracious, an American variety, remarkable for delicate tint of soft pink, and profusion of small petals which imparts to it a novel and distinct appearance.

Other fine and promising varieties were John Noble, a bold and massive incurved Japanese, the colour a kind of chocolate crimson, the reverse of the petals which are very broad and stout, being bronzy-gold—quite distinct in character; Secretary Farson, reddish-salmon base with golden centre; Mrs. Smith Rigland, a large broad-petalled incurved Japanese, having a reddish cinnamon surface, and a rich golden reverse, a variety not seen at its best on this occasion, but with a great future before it; Robert Owen, a very fine golden incurved; Walter Surman, a somewhat formal incurved Japanese, but large and full, having a bronzy-salmon base and a golden reverse; Francis T. Brage, a bright golden reflexed; Mr. H. Brownhead, pale cinnamon with a golden reverse; Mrs. A. Rogers, pure deep yellow of the W. H. Lincoln type; Mlle. Thérèse Pancoucke, a broad-petalled incurved white; Golden Gate, rich deep gold, extra fine; Mrs. F. Denne, delicate lilac-pink, deepening to cerise, a broad-petalled incurved Jap.; Abbé Mendenhall, pale canary, with a golden centre; Golden Wedding, rich gold, very fine; Nevada, white; Lord Brooke, in strict incurved character; Charles Blick, a reflexed gold; and Le Prince du Bois, a pale-coloured variety of considerable promise. From Mr. C. H. Ratsch, St. Peter's Buildings, Bonremouth, came Japanese R. B. L. Monk, which is like a broad-petalled *Gloriosum*, with

curious whorled florets, white in colour, and quite distinct in character. Mr. William Wells, nurseryman, Earlswood, had Mrs. L. C. Madeira, a fine yellow incurved, but with a tendency to come oval in the centre, which destroys its symmetry; and one or two single varieties from his large collection.

Orchid Committee.

Present: H. J. Veitch, Esq., in the chair; and Messrs. J. O'Brien (Secretary), Dr. M. T. Masters, F.R.S., De B. Crawshay, C. J. Lucas, T. Statter, E. Hill, H. M. Pollett, H. Ballantine, J. Jaques, T. B. Haywood, and J. Douglas.

The objects brought to the meeting were, for the time of year, both interesting and numerous. Messrs. J. Veitch & Son, Royal Exotic Nursery, King's Road, Chelsea, exhibited a group of rare and exceptionally fine Orchids, and were awarded a Silver Banksian Medal. Among their plants were *Cypripedium* × *Oenone* (*Hookera* ♀, *superbiens* ♂). Award of Merit; *C.* × *T. B. Haywood*, with several flowers; *C.* × *Harrisianum* *superbum*; a spike of *C.* × *Sedeni candidulum*, with five flowers open, and several buds; *C.* × *Theresites* (*Sedeni* ♀, *Lindleyanum* ♂); *C.* × *Creon* (*Harrisianum* *superbum* ♀, *oeranthum* *superbum* ♂); *C.* × *Pylæus*, *C.* × *Lathamianum*, the singular *Dendrobium* × *Stratiotes*, *Sophrontis grandiflora* with thirty flowers; a fine plant of *Oncidium divaricatum*; *Oncidium cheiroporum*, with ten spikes; *Cattleya* × *leucoglossa* (*fausta* × *Loddigesii*), *C.* × *Phidone* (*intermedia* ♀, *maxima* ♂); the singular *Dendrobium glomeratum* (Botanical Certificate); and varieties of *Lælia anceps*, &c.

Messrs. F. Sander & Co., St. Albans, arranged an effective group, in which *Lælia anceps* were remarkable, among them being the varieties *Sanderiana*, *Percivaliana*, *Barkeriana*, and *Oweniana*. Mexican *Lælia* were *L.* × *Crawshayana*, *L. Gouldiana*, *L. autumnalis alba*, &c., together with *Brassia Leeana*, a species allied to *B. candida*; *Chysis Oweniana*, a species with pink and white flowers; *Odontoglossum Roseii* *excellens*, *Zygopetalum rostratum* (Award of Merit), *Aganisia ionontera*, *Cypripedium* × *nitens* *Sander's* var., *C.* × *Masonianum*, *C.* × *Ridolfianum*, and *C.* × *Lynchianum* *superbum* (Silver Banksian Medal).

Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, had an extensive group, in which were fine plants of twenty distinct species and varieties of *Cypripedium*, two of the most remarkable being *C.* × *Pitcherianum*, *Williams' var.* and *C.* × *Leeanum giganteum*. Among other good plants included in this group were *Calanthe* × *Mylesii*, pure white; *Lælio-Cattleya* × *Blesensis*, *Lælia acuminata rosea*, varieties of *L. anceps*, *L. Gouldiana*, *Oncidium obryatum*, *Odontoglossum crispum*, *O. asperum*, and *O. Insleayi splendens* (Silver Banksian Medal).

Messrs. Linden, l'Horticulture Internationale, Parc Leopold, Brussels, staged a group of rare Orchids, and obtained an award of a Silver Banksian Medal. Two very extraordinary new *Lycastes* from Peru were among the exhibits, both possibly natural hybrids. One of these, *Lycaste Imachootiana*, had the habit of *Lycaste Skinneri*, and flowers equal in size to those of that species. The broad sepals were greenish-fawn minutely spotted with purple except at the tips; petals pale yellow, with red dotted lines at the base inside; lip bright yellow, spotted with orange-red at the base and on the callus (Award of Merit). The other, *Lycaste Luciani*, had flowers equal to those of *L. lasioglossa* and, as in that species, the lip is hairy. The sepals were spotted with pale pink, on a pale fawn-coloured ground; petals white, with a few rose dots; lip rose and white (Botanical Certificate). Another grand thing in this group was the massive white *Odontoglossum crispum* *Thompsonæ*, with rich dark spots on the sepals; and one which is scarcely its inferior, the fine unspotted *O. c. amplissimum*. The variety *Thompsonæ* received an Award of Merit. Other good plants were *Lælio-Cattleya* × *Stehegolowiana* (*L. grandis* × *C. labiata*), *Cypripedium* × *Robinsonianum* (*Lowii* × *Parishii*); *Oncidium Phalanopsis*; a cut spike of *Cattleya labiata*, with six flowers; one of the charming scarlet *Cochlioda Noezliana*, with about twenty blooms, and *Catasetum virens*.

Messrs. Hugh Low & Co, The Nurseries, Clapton, exhibited a very fine selection of Orchids, many good *Cypripediums* being included, and among them their new *C.* × *Smithii* (*Lawrenceanum* × *ciliolare*), a very richly-coloured cross-bred, with flowers in which the beauties of *C. Lawrenceanum* play an important part. The group received a Silver Banksian Medal. C. W. Fincken, Esq., Hoyland Hall, Barnsley (gr., Mr. J. Milburn), again showed the

beautiful natural hybrid, *L. Finckeniana*, with six flowers on a spike (First-class Certificate). C. J. Lucas, Esq., Warnham Court, Horsham (gr., Mr. Duncan), showed *Cypripedium* *Clinkaherry-unum* × var. *Warnhamense* (*Curtisii* ♀, *Philippinensis* ♂), a very fine hybrid (see *Gard. Chron.*, July 22, 1893, fig. 18) (Award of Merit); *Dendrobium infundibulum*, *Phaius maculatus*, and *Compactia macroelectron*.

M. Jules Hye-Laysen, 8. La Coupure, Ghent, sent a grand *Cypripedium* in his *C.* × *fasciatum* (*Spicerianum* × *hirsutissimum*) with very large purple-tinted flowers. It is of the same parentage as *C.* × *Ceres*, originally described in the *Gardeners' Chronicle*, but in this one some circumstance has brought about a much finer thing (First-class Certificate).

Baron H. Schröder, The Dell, Egham (gr., Mr. H. Ballantine), sent a gigantic inflorescence of his unique *Cymbidium Traceyanum*, one of three spikes borne on the plant this year (Cultural Commendation), also a grand spike of *Lælio-Cattleya* × *Nysa* (*L. crispa* × *C. Waracewiczii*) which surpasses *L. c.* × *Exoniensis* (First-class Certificate); *Cypripedium* × *Leeanum* *superbum*, *C.* × *Glatea*, *C. insigne Sanderæ*, *C. i. Sanderiana*, and the rare *Brassia anthorotis* (Botanical Certificate).

R. I. Measures, Esq., Cambridge Lodge, Cambridge (gr., Mr. Chapman), showed *Cypripedium venustum* *Measuresianum*, an extraordinary and beautiful form with white and green flowers, without any of the brown and red seen in the type (Award of Merit); the beautiful *Pleurothallis scapha* (Botanical Certificate); and *Cypripedium* × *Celeus*.

His Grace, the Duke of Northumberland, Sion House, Brentford (gr., Mr. G. Wythes), showed an effective group of cut spikes of *Calanthes* set up with Maidenhair Ferns (Silver Banksian Medal); W. Vanner, Esq., Camden Wood, Chislehurst (gr., Mr. G. H. Robbins), showed *Cypripedium* × *pulchellum* (grande × *Sedeni candidulum*); and *C.* × *Io-Spicerianum*. F. Wigan, Esq., Clare Lawn, East Sheen (grower, Mr. W. H. Young), staged *Cypripedium* × *Wiganianum* (? *Harrisianum* × *Ashburtoniæ*), a distinct and rather striking flower. J. F. Ebner, Esq., Woodlands, Beckenham (gr., Mr. A. Waite), sent *Cypripedium* × *Sallieri anreum* (Award of Merit). H. Hainsworth, Esq., St. John's Park, B'ackheath, showed *Cirrhopetalum ornatisimum*.

T. Statter, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), showed *Cypripedium* × (*villosum* × *oeranthum* *superbum* × ?) a flower of the *C. nitens* class, with purple colouring showing through the upper sepal.

M. Wells, Esq., Bloomfield, Sale, Manchester (gr., Mr. Hinde), sent *Lælio-Cattleya* × *exoniensis*; and E. Ashworth, Esq., Harefield Hall, Wilmalaw, Cheshire, showed *Lælia anceps Amesiana*.

Fruit Committee.

Present: P. Crowley, Esq., in the chair; and Messrs. Henry Vilmorin, G. Bunyard, G. Tabor, H. Pearson, J. Cheal, C. W. Cummins, W. Warren, T. J. Saltmarsh, J. Wright, A. Dean, J. A. Laing, W. Bates, J. Willard, C. Ross, G. Wythes, F. Q. Lane, J. Hudson, W. Balderson, G. H. Sage, J. Smith, A. H. Pearson, and R. Hogg.

The exhibits were not numerous, but a capital collection of Apples was staged by Messrs. H. Lane & Son, Berkhampstead, including a large heap of Lane's Prince Albert and King of the Pippins; also dishes of many other varieties in first-class condition. Some of the more noticeable were Norfolk Beaufin, Golden Noble, Yorkshire Greening, Peasgood's Non-such, Lady Henniker, Fearn's Pippin, Hoary Morning, Gascoigne's Scarlet, Annie Elizabeth, Bismarck, Hanwell Souring, Blenheim Orange, Court Pendu Plat, Calville Rouge Précoce (a very pretty little fruit), Warner's King, Col. Vaughan, &c. (Silver Knightian Medal).

A smaller collection of Apples and a few Pears came from Messrs. Jno. Laing & Sons, Forest Hill, S.E.; good examples of Norfolk Beaufin, Waltham Abbey Seedling, Alfriston, King of the Pippins, Bramley's Seedling, &c. The Pears were Easter Beurré and Catillac (Bronze Banksian Medal).

A fine collection of Kales was put up by Messrs. Jas. Veitch & Sons, Chelsea, including a number of variegated forms; also the Palm-tree Kale, one of the largest varieties, of dark green; Veitch's Late Curled, and Chelsea Exquisite Curled Kale. Three stems of Brussels Sprouts, Ne Plus Ultra, were from the same exhibitors (Vots of Thanks).

From the Royal Horticultural Society's Gardens at Chiswick were sent several heads of Cabbage, Christmas Drumhead (Award of Merit), and several

of the old St. John's Day Cabbage. The Portugal Kale, Couve Tronchuda, also sent, is worthy of more extended culture, there being no better early winter vegetable; although but little heart is formed, the leaves are quite tender when cooked, and the flavour is thought by many to be more delicate than the Cabbage.

Mr. Owen Thomas, the Royal Gardens, Windsor, exhibited fruits and fruiting branches of a good winter Tomato named Frogmore Selected (Cultural Commendation).

D. C. A. Cave, Esq., Sidbury Manor, Sidmouth, Devon, contributed a few fruits of a seedling Orange named Edith. The fruits were large, and in shape almost round (First-class Certificate).

NATIONAL ROSE.

REPORT OF THE COMMITTEE FOR THE YEAR 1893.

The past season, owing to the continued drought and heat, proved one of the most disastrous for Roses and Rose shows that has been experienced for many years, so that notwithstanding the loyal support of the exhibiting members at the three exhibitions held by the society, the blooms staged were, as a rule, much below the average in number, size, and quality. The competition at the show of Tea Roses held at the Drill Hall, Westminster, was good, also in several of the leading classes at Work-sop, but at the Crystal Palace there were fewer Roses than at any similar exhibition for nine years. In connection with the Work-sop Show, some of the stands exhibited at which were exceptionally fine, it should be stated that the success of the exhibition was greatly due to the admirable manner in which all the arrangements connected with it were carried out by the committee of the Work-sop Rose and Horticultural Society, especial credit being due to Mr. H. V. Machin, Vice-President, Mr. G. J. Whall, Hon. Treasurer, and Mr. G. Baxter, Hon. Secretary.

The new catalogue of exhibition and garden Roses was issued to members early in May last, and appears to have been much appreciated. Several foreign trade growers have already followed the society's lead in introducing into their own catalogues a separate section for Hybrid Teas upon similar lines to that adopted in the Society's catalogue.

It is with much regret the committee announce the loss the society has sustained during the year through the death of one of its Vice-Presidents—the Rev. J. M. Fuller—whose valuable services as chairman at their meetings will be greatly missed. They have also to deplore the death of Monsieur J. B. Guillot, a recently-elected honorary member, and so well known to rosarians generally as the raiser of many of the choicest Tea and other Roses in cultivation.

Notwithstanding the great depression in trade which has prevailed throughout the country during the past year, the number of members as well as the number of affiliated societies has been well maintained; in fact, in no previous year, with the exception of 1892, have the present numbers been exceeded.

Financial Statement.—The committee congratulate the members upon the present satisfactory financial position of the society. The amount in hand at the beginning of the year was £31 16s. 7d., and now at its close there remains £51 19s. 3d. to carry forward to the next account, the total expenditure having been £699 3s. 3d., while the aggregate receipts, including last year's balance, were £781 2s. 6d. It should here be stated that a special fund was raised early in the year among the exhibitors to defray the cost of printing and binding the new catalogue, so that no part of the cost of its publication has fallen on the ordinary funds of the society. Although more than the usual number of changes have taken place in the *personnel* of the non-exhibiting members, the amount received in subscriptions was nevertheless in excess of that of any previous year.

ARRANGEMENTS FOR 1894.

In order to meet the requirements of exhibitors in all parts of the country, it has been decided by the committee to hold next year a Southern Show, a Metropolitan Show, and a Northern Show. The early exhibition of Tea Roses at the Drill Hall, Westminster, will therefore be discontinued, and a Southern Show be held instead of it at Windsor, in connection with the Windsor, Eton, and District Horticultural and Rose Society, on Wednesday, June 27. The Metropolitan Show will take place at the Crystal Palace on Saturday, July 7, while the Northern Show will be held at Halifax on Thursday,

July 19, in conjunction with the Salterhebble and District Rose Society.

Members' Privileges.—Members subscribing £1 will be entitled to two private view tickets and four transferable tickets, the latter admitting at the same time as the general public, while subscribers of 10s. are entitled to one private view ticket and to two transferable tickets. Each of these tickets is available for any one of the society's exhibitions. Members joining the society for the first time next year will also receive a copy of the society's new descriptive catalogue of exhibition and garden Roses. Members alone are allowed to compete at the society's exhibitions.

There are two classes of helpers to whom the committee feel especially grateful. In the first place to those local secretaries who have either secured for the society new members, or, where this has not been possible, have done all in their power to keep within its ranks those they had previously obtained; and secondly, to all those who, by the gift of special prizes or by contributing to the prizewinners' fund for the new catalogue, have enabled the committee to maintain the high standard of prizes offered in the schedules. Among the local secretaries two are worthy of special mention—Mr. C. J. Grahame, late local secretary for Croydon, who again secured for the society a large number of new subscribers; and Mr. C. F. Hoare, who has for many years rendered the society such good service as local secretary for Beckenham, and to whose zeal and energy the Society is indebted for the largest number of subscribers ever obtained by any individual member of it.

NATIONAL CHRYSANTHEMUM.

DECEMBER 11.—A meeting of the General Committee took place at Anderton's Hotel, Fleet Street, on the above date; Mr. R. Ballantine presiding over a large attendance. A hearty vote of thanks was passed to Messrs. E. D. Shuttleworth & Co., Albert Nursery, Peckham, S.E., for their generous contribution of a fine collection of plants, free of charge, for the annual dinner. The chairman reported that the dinner was a great success, and that in extent and quality the December Exhibition had surpassed all expectations. The desire for a change of place for the exhibitions of the Society came up once more on a report made by the chairman as to an examination he had made of the Westminster Town Hall, and the examination of the Hall on the Thames Embankment, showing by their measurements that they were wholly inadequate to contain the exhibits, while the terms were very high, and the conditions severe. A resolution was passed to the effect that a sub-committee be appointed to look for suitable buildings for the purpose, and report in October next, but as a sufficient number was not nominated, the proposal fell to the ground. An interim report of the schedule sub-committee was presented, and the dates of the various exhibitions in 1894 were confirmed as follows:—Early Autumn Show, October 10, 11, and 12; Great November Show, November 6, 7, and 8; Early Winter Show, December 4, 5, and 6. And the list of judges for the same nominated by the sub-committee was also passed. The Secretary submitted a financial statement, showing that the receipts from all sources amounted to £653 odd; the reserve-fund having reached the sum of £54. The award of Medals made by the Arbitration Committee at the December Show were confirmed, and fourteen new members were elected, bringing the total for the year up to 164. An able, exhaustive, and interesting Paper on "Judging Chrysanthemum Blooms," prepared by Mr. Charles E. Shea, was then read by the Secretary, and some discussion followed. It is intended that the paper shall be fully considered on a future occasion. A hearty vote of thanks was passed to Mr. Shea for his paper, and also to the Chairman for presiding.

DECEMBER 13.—The last meeting of the Floral Committee for the present year took place at the Royal Aquarium on the above date, but, with the exception of a large collection of Chrysanthemums, numbering about 300 blooms, from Mr. R. Owen, Maidenhead, little else was produced. First-class Certificates of Merit were awarded to Japanese Owen Thomas, a grand variety, raised by the exhibitor, a large incurving flower, in the way of W. H. Lincoln, but richer in colour and broader in the petal; and to Good Gracious, an American variety, described in our report of the Royal Horticultural Society's meeting. Secretary Farson, rosy bronze-gold, also from Mr. Owen, was Commended; and a charming

white variety, in the way of Mdlle. Thérèse Rey, the Committee wished to see again; this variety was also shown by Mr. H. J. Jones, Lewisham. The Elms Expanding Show-board was shown by the inventor, Mr. Charles E. Shea, and was very highly commended by the Committee as an ingenious invention, and as enabling exhibitors to see their old show boxes.

TREES AND SHRUBS.

PINUS INSIGNIS.

I HAVE read with great interest Mr. Ward's account of the fine tree of *P. insignis* at Longford Castle; and as he asks if there are finer trees in the United Kingdom, I send measurements of one we have here at Redleaf. This tree was one of the first sent out in this country, at least, I have been told so by one of our leading nurserymen, who remembers the time very well. I measured the tree this morning, and I find that the height is just 70 feet; circumference, at 1 foot from the ground, 12 feet 9 inches; at 3 feet, 11 feet 1 inch; 6 feet from the ground, 10 feet 4 inches; extreme width of branches, 70 feet. This tree is somewhat crowded up by other trees, and Rhododendrons and other shrubs planted underneath have no doubt spoiled the shape of it, as on one side it has lost most of its branches, but the tree itself is in perfect health. In the year 1881, this tree measured 66 feet 6 inches in height; at 3 feet from the ground, 10 feet 4 inches; at 6 feet, 9 feet in circumference—so that it has only gained 3 feet 6 inches in height in twelve years.

This is different from the growth made in its young state, as, fortunately, I have measurements taken of this same tree. In the year 1842 it was in height 2 feet 4 inches, probably planted at that time; in 1844, height 7 feet 1 inch; in 1846, height 13 feet 4 inches; and in 1848 it was 19 feet 6 inches in height and 1 foot 8 inches in circumference—so that in the first years of its existence it grew 17 feet 2 inches in six years. There is one peculiarity of the tree here, which is, that I have never known it to be injured by frosts or cutting winds, whereas during the last fifteen years we have lost several young trees, from 10 to 20 feet high, through the severe winters we have had in that time.

It may be that the first plants sent out were of a hardier nature or different variety in some way to others. I should like to hear what other correspondents have to say on this subject, as no doubt it would be more largely planted than it is were it not so often cut down and spoiled by frosts. I think that it is one of the handsomest trees we have of the Pine tribe. We have several fine specimens of other species of Conifers, and I shall be pleased to send an account of them some time, if of interest to your readers. *W. H. Holah, Redleaf, Dec. 11, 1893*

THE ROSARY.

THE BANKSIAN ROSES.

WHEN the loose rambling shoots of these have successfully passed through the winter, we are favoured with one of the most pleasing sights Roses provide. Unfortunately this section is only half-hardy, and many disappointments have been caused by injudicious planting. The Banksian Roses are more generally grown in pots by nurserymen than in the open border, and this fact allows of early spring planting, so that the Rose becomes partly established before meeting its first winter in the open. It is very necessary that a warm and sheltered position be chosen. I think the finest I have seen were rambling over the porch of a gamekeeper's cottage; the shelter of the surrounding trees being very acceptable to this Rose. Even with the advantage of a sheltered position, it is essential to have a somewhat dry border for the roots. The great advantage of this lies in the earlier and more thorough maturation of the summer growth, and the lessened susceptibility to the effects of frost

They are well worth the trouble of watering during summer, and a little attention in this respect will ensure some grand shoots for the following season's bloom. These may also be aided considerably by the prompt removal of growth that has flowered, thus directing the whole of the plant's energies to the right purpose.

It is not sufficiently well known that there are two distinct Roses sold under the name of White Banksian—one possessing only solitary blooms, and the other nodding panicles or trusses. In Mr. Baker's "Classification of Garden Roses," published in these pages (1885), the group of Banksians is divided into four species; and one of these (*Fortuneana*) has become confused with the white form of the Banksian proper—*Rosa Banksia alba*. There is a vast difference between the two species. The White Banksian was introduced from China in 1807 by Mr. W. Kerr, and has numerous trusses of very double blossoms, which rarely exceed the size of a shilling-piece. *R. Fortuneana* (*Fortunei*, and *Fortune's White*), on the other hand, produces solitary blossoms of considerable size—often as large as a five-shilling piece. This was introduced from the same country in 1846. It is much the strongest grower, and also the hardiest of the Banksians, which will account for its having been frequently sent out from nurseries as the White Banksian. It may be as well to point out a very easy way of recognising the two species by their leaves, and as they are almost evergreen, this will prevent the disappointment of planting the wrong one. The leaves of *R. Banksia alba* are oblong-lanceolate, obtuse, and very hairy at the base of the middle nerve; and the wood very seldom carrying any prickles. *R. Fortuneana* has ovate-lanceolate leaves, much brighter in colour than the former, and shining on both sides. It also possesses a few prickles. *R. Banksia alba* has been styled the "Rose without a thorn," and is probably more deserving of the title than any other species.

The yellow Banksian is represented in double and single form, and the double is sweeter scented, freer, and hardier than the white variety. This also blooms in clusters, and is of the same size as the true white. *R. Banksia lutea* was introduced to England by the Royal Horticultural Society through their representative, Mr. J. Damper Parks, who brought it home in 1824. The white Banksian has a distinct Violet scent; but I think the yellow has the most showy appearance. *A. P.*

MARKETS.

COVENT GARDEN, December 14.

We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. *Ed.*

PRICES rule as last week.

POTATOS.

The mild open weather with abundance of good and cheap vegetables, has a very depressing influence on our Potato market. Stocks continue to increase and prices for most samples continue to fall. *J. B. Thomas.*

SEEDS.

LONDON: Dec. 13.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report to-day's market thinly attended, with but little business doing. All descriptions of Red Clover seed, both foreign and English, keep firm. Alsike White and Trefoil are steady. Italian and Perennial Rye grasses continue weak. In Spring Tares the tendency is still upwards. Canary seed shows a further advance. Advertis just received from Constantinople, bearing date Dec. 5, 1893, give, as the total stocks then existing in all Turkey, the small number of 25,000 bags only. Mustard and Rape seed are unchanged. As regards Peas and Haricots, there is nothing fresh to note.

FRUITS AND VEGETABLES.

BOROUGH: December 12.—Quotations:—Savoys, 3s. to 6s.; Cauliflowers, 4s. to 6s. per tally; Turnips, 1s. to 1s. 6d.; Carrots, 2s. to 3s.; Parsley, 1s. to 1s. 9d. per dozen bunches; Onions, 5s. 6d. to 6s. 6d. per bag; English, do., 6s. 6d. to 7s. per cwt.; Apples, 1s. 3d. to 6s. per bushel.

SPITALFIELDS: December 12.—Quotations:—Savoys, 3s. to 6s.; Cauliflowers, 4s. to 6s. per tally; Turnips, 1s. to 1s. 6d.; Carrots, 2s. to 3s.; Parsley, 1s. to 1s. 9d. per dozen bunches; Onions, 5s. 6d. to 6s. 6d. per bag; English, do., 6s. 6d. to 7s. per cwt.; Apples, 1s. 3d. to 6s. per bushel.

FARRINGTON: Dec. 14.—Quotations: Brussels Sprouts, 2s. to 2s. 6d. per bushel; Parsnips, 55s. to 60s. per ton; Carrots, 45s. to 50s. do.; Onions, 8s. to 9s. per cwt; Celery, 8s. to 9s. per dozen; Apples, cooking 4s. 6d. per bushel; do., Blenheim's, 6s. to 7s. do.; English Grapes, 1s. 2d. to 1s. 6d. per lb.; Almeira, 11s. per barrel; English Tomatoes, 6d. per lb.

POTATOS.

BOROUGH AND SPITALFIELDS: December 12.—Prices to-day ranged from 35s. to 100s. per ton.

FARRINGTON: Dec. 14.—Quotations:—Main Crop, 80s. to 90s.; Bruces, 60s. to 70s.; Magnums, 45s. to 55s.; Imperators, 40s. to 45s.; Sutton's Abundance, 60s. to 70s. per ton.

LONDON AVERAGES: Dec. 13.—Hebrons, 80s. to 100s.; Regents, 50s. to 70s.; Snowdrops, 70s. to 80s.; Main Crop, 60s. to 90s.; Magnums, 40s. to 60s. per ton.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending December 9, and for the corresponding period in last year:—1893: Wheat, 25s. 9d.; Barley, 22s. 1d.; Oats, 18s. 4d. 1892: Wheat, 28s. 10d.; Barley, 25s. 1d.; Oats, 17s. 4d.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 140s. to 154s.; new, do., 125s. to 145s.; inferior, do., 100s. to 120s.; Hay, best, 145s. to 170s.; inferior, do., 90s. to 100s.; new Mixture, 115s. to 130s.; and Straw, 35s. to 55s. per load.

CHRISTMAS CATTLE.

ISLINGTON: Dec. 11.—There was a falling off, as compared with last year, in the supply of both cattle and sheep; notwithstanding the trade was not exceptionally brisk, and no material alteration in price has to be recorded. In beasts,

Scotch cattle were the great feature of the exhibition, but all others were of high quality. Prices ranged from 4s. 6d. to 5s. 2d. per 8 lb. The number put on sale was 4610 head. Sheep numbered 13,550—nearly 2000 less than last year. They consisted chiefly of Down, but there was a good show of the usual classes. Prices ranged from 4s. 8d. to 5s. 8d. Remembering the bad season for both breeding and feeding, some surprise may be felt at the market result as a whole.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

- Principal Grazing, &c., Districts—
- 6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending December 9, is furnished from the Meteorological Office:—

"The weather continued very unsettled, with frequent falls of rain in all parts of the kingdom. Thunder and lightning were experienced at many of our western and north-western stations towards the end of the period.

"The temperature was slightly below the mean in 'England, S.' and just equalled it in 'England, E.' and 'England, S.W.,' but in all other districts it was above the normal, the excess in Scotland amounting to 4°. The highest of the maxima were registered on the 6th, and ranged from 55° in 'Scotland, E.' to 50° in 'England, E.' The lowest of the minima occurred at the commencement of the week, when the thermometer fell to 15° in the 'Midland Counties' and 'England, S.W.,' 17° in 'England, S.,' 18° in 'England, E.,' and to between 21° and 30° in nearly all other districts.

"The rainfall greatly exceeded the mean in 'Scotland, N.,' and was rather more than the normal in the other Scotch districts, and in 'Ireland, S.' In most other districts there was a slight deficit.

"The bright sunshine was much less prevalent than during the preceding week; it slightly exceeded the mean value in most parts of England, but showed a deficit in Ireland and Scotland. The percentage of the possible duration ranged from 28 in the Channel Islands, and 26 in 'England, S. and S.W.,' to 9 in 'Scotland, E. and W.,' and in 'England, N.W.,' while in 'Scotland, N.' the percentage was less than 0.5."

BOOKS: *T. L.* The one that will give you the best methods of cultivating vegetables is Vilmorin's, *The Vegetable Garden*, published by John Murray, London.—*A. E. P.* There are a few manuals on forcing Cucumbers, Tomatos, Melons, and Mushrooms, but none on forcing in general.

BOOKS ON NURSERY PRACTICE: *A. Z.* You should take service in a first-class nursery where the subjects you wish information about are largely grown. As a help, get *Loudon's Encyclopedia of Plants*—it may be purchased at a second-hand bookstall; *A Manual of Conifers*, Veitch: published by the author, 544, King's Road, Chelsea; *Handbook of Hardy Trees, Shrubs, and Herbaceous Plants*, by Decaisne & Naudin, edited by W. B. Hemsley (Longmans & Co., London); *The Nursery Book*, by Bailey; New York Rural Publishing Co.

CROP OF TOMATOS: *A. Y. Z.* We cannot say what weight of fruit a plant of the Old Red variety would carry, as a plant would live for several years, and produce a greater weight each year. A Tomato, treated as an annual, and kept to one stem, would be capable of producing 20 to 25 lb. of fruit when fruited in the warmer part of the year. We have no belief in the so-called "heavy croppers." All are such under the best methods of cultivation, and at the natural fruiting season. The nearer you get to the original form the more freely they set their flowers in the dull season, but in the late spring and summer-time there is not much difference between them.

GREASE BAND FOR WINTER MOTH: *F. S.* We do not think any injury is likely to accrue to the bark of the tree if the band is properly applied. The reference to American blight is probably a slip of the pen?

LIME: *The Librarian.* Lime in its simple form acts as a fertiliser in soils deficient in that substance. It also acts as an ameliorator of heavy land, and it is useful in soils containing much vegetable matter, such as are most kitchen gardens that have been long in cultivation. It is present in most artificial manures.

NAMES OF FRUITS: *W. S. L.* Apple, Hoary Morning.—*K. H. H.* Lamb Abbey Pearmain.—*A. Chapman.* 1, A very excellent small Pear, resembles Baronne de Melo; 2, Marie Louise D'Uccle; 3, Passe Colmar.—*S. F. I.* Overripe and much bruised; 2, Beurré d'Areberg; 3, Vicar of Winkfield.—*J. G.* 1, London Pippin; 2, Scarlet Nonpareil; 3, Winter Hawthornden; 4, Not known, we had some difficulty in making out numbers, so indistinct was the pencil on the old newspaper.—*B. B., Exeter.* Pear, Vicar of Winkfield.

NAMES OF PLANTS: *K. H. H.* *Eulalia japonica foliis striatis*.—*G. E. A.* 1, *Crassula lycopodioides*; 2, *Opuntia* sp.; 3, *Opuntia microdasys*; 4, *Mesembryanthemum* sp.; 5, *Mamillaria texana*; 6, *Alpinia* or *Zingiber*; 7, *Sansevieria zeylanica*. Those not determined should be sent when in flower.—*Subscriber.* *Asparagus decumbens*.—*N. C. C.* *Lælia anceps alba*. No doubt you are right in the name of this plant, but your flowers are larger than any we have seen.—*F. R., St. Albans.* 1, *Cassia corymbosa*; 2, *Pittosporum undulatum*. Apple next week.—*W. M.* 1, Send in flower; 2, *Taxus adpressa*; 3, *Taxodium distichum*; 4, Send in flower; 5, *Diosma ericoides*; 6, *Peristrophe (Justicia) speciosa*; 7, *Eriostemon nerifolius*.—*December.* 4, *Pteris serrulata cristata*; 5, *Pteris cretica*; 6, *Selaginella stolonifera*; 7, *Adiantum decorum*.

P.O.O. payable at 794, Old Kent Road; Cheques crossed "L. and S. W. Bank."

GREENHOUSE DEPARTMENT.

THE AMATEUR FORCING HOUSE. TENANT'S FIXTURE (Span-roof).

These houses are offered at an exceedingly low rate, and should be readily approved by both amateur and professional gardeners, as brickwork, which is very expensive to a small house, is entirely dispensed with.

The utility of such a house for forcing or cultivating Cucumbers, Tomatos, Melons, &c., will be perceived at a glance, it being a structure constantly in request but almost hitherto unknown.

Specification—Framework substantially constructed of red deal; the whole of sides, and 2 ft. 6 in. of ends, boarded with well-seasoned tongued and grooved matchboards. Half-glass door, complete with rim lock and brass fittings, in one end; glass 16 oz. throughout, English cut. Ventilators supplied according to size of house, and stays necessary for opening same; stages for plants each side of house, all woodwork painted one coat of good oil paint, and the whole structure securely packed and placed on rail.

Lot.	Length.	Width.	Height.	Usual Price.	Sale Price.
1 to 7	7 ft.	5 ft.	7 ft.	£2 10 0	£2 0 0

SPAN-ROOF VILLA CONSERVATORIES.

Adaptable for the lawn of a villa residence, being well and substantially built, constructed of the best materials, and artistically finished, with diagonal panels and barge-boards. The framework is composed of 2 in. by 3 1/2 in. red deal, the lower part doubly-lined with tongued and grooved matchboards, and the roof properly fitted with sashes, which facilitates fixing or removing of same without disturbing glass.

The houses are fitted with a half-glass door, complete with rim lock, brass fittings and key, and is supplied with lattice staging for each side, footpath the entire length; gutters, down pipes, suitable ventilators, and necessary ironwork for opening same. All woodwork painted two coats of good oil paint, glass cut to sizes, and all parts securely packed on rail. Prices:—

21 oz. for Roof 5 per cent. extra.

"AMATEUR" SPAN-ROOF AND LEAN-TO GREENHOUSES. Tenant's Fixtures.

Made especially for Amateurs at a nominal figure, thereby coming within reach of those who require a strong but inexpensive structure, and being constructed in complete sections, are erectable by any handy-man or gardener in a few hours. Framework is substantially constructed of red deal, the lower part being filled in with well-seasoned tongued and grooved matchboards. The house is fitted with door complete, with rim lock and brass furniture, painted one coat of good oil colour, supplied with all necessary ironwork and stages for each side, and good 16 oz. glass throughout. All parts securely packed, and put on rail.

CARMAN to a Nurseryman.—Age 27; good references.—C. COOPER, Calveston Green, Meopham, Gravesend, Kent.

REAPING AND SOWING are the two most important periods in the life of the farmer, and granting that all circumstances are favourable, he naturally, during the latter period, hopes to get an adequate return for his labour. As he sows, he expects to reap, and unless constant industry has been exercised, the harvest is generally a poor one. So it is with regard to health, if we are not constantly on the watch, and destroy the germs of disease as soon as they are discerned, the body becomes weakened, and at last is unable longer to resist the attacks of the enemy. Holloway's Pills destroy even the most minute traces of disease, by purifying the blood and strengthening the system.

"GARDENERS' CHRONICLE."

Continued Increase in the Circulation.

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

Increased to the extent of 75 per Cent.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

H. CANNELL AND SONS' SEEDS.

Their Catalogue of the above will be sent post-free to all their friends and coming customers on application. Its value will surprise many, also the success of their Own Grown Seeds. It is a fact their superior quality increased our orders 2000 last season, absolutely proving they are better in every respect, and Five Silver Medals awarded at London Rig Shows for Vegetables confirm it, and with their mode of business, is evidently highly appreciated all over the World.

FOR SALE.—OIL PAINTING, by E. Moira. Subject, "Camden Park, Chislehurst, 1860." The various changes which Camden Estate has undergone since 1860 render this work of unusual interest. Offers invited. Can be seen by arrangement.—G. F., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

SUTTON'S AMATEURS' GUIDE in HORTICULTURE for 1894 is now ready.

SUTTON'S AMATEURS' GUIDE in HORTICULTURE for 1894 is now ready.

SUTTON'S AMATEURS' GUIDE in HORTICULTURE for 1894 is now ready.

Price 1s. post-free; gratis to Customers, from SUTTON AND SONS, THE QUEEN'S SEEDSMEN, READING.

SEAKALE for FORCING.—Extra strong, 10s. per 100; seconds, ditto, 6s. per 100. Free on rail for cash with order only. G. STEVENS, St. John's Nursery, Putney, London.

STRONG STANDARD APPLES. £1, £5, and £8 per 100. Best sorts. CHARLES TURNER, Royal Nurseries, Slough.

COELOGYNE CRISTATA.—A fine variety, well grown and cheap. Plants with 12 to 18 bulbs, 1 or 2 spikes, 1s. 6d. to 2s.; strong 30 bulbs, 5 to 7 spikes, 3s.; about 60 bulbs, 8 or 9 spikes, 5s.; stronger, 100 to 150 bulbs, 12 to 20 spikes, 7s. 6d. to 12s. 6d. each. TRUSTEES, late J. STEVENSON, Timperley, Cheshire.

ORCHIDS.—Many rare and choice Cattleyas, Cypripediums, Dendrobiums, Odontoglossums, &c., always in stock. Inspection invited. Please write for LIST. W. L. LEWIS AND CO., F.R.H.S., Chase Side, Southgate, London, N.

RASPBERRY CANES.—Norwich Wonder, Carter's Prolific, also Fastoff, well rooted. Not less than 500 canes of either sort supplied. ALBERT BATH, Vine Court, Sevenoaks, Kent.

MILLER'S SEAKALE gives great satisfaction. Strong roots for forcing, 8s. 6d. per 100; extra large massive roots, for quick forcing, 12s. 6d. per 100; good roots, for planting, 5s. 6d. per 100. F. MILLER AND CO., 267, Fulham Road, London, S.W.

Seakale, Peach Trees, Rhubarb, and Asparagus. BAGLEY'S noted SEAKALE for Sale; also two, three, and four-year old PEACH TREES, in pots; two, three, and four-year old Victoria and Champagne RHUBARB; and one-year-old ASPARAGUS. For Prices apply to WM. BAGLEY, Millshot Farm, Fulham, S.W.

SUPERB ORCHIDS, CHEAP.—Thousands to select from. Write for LIST, free. P. MCARTHUR, The London Nursery, 4, Maida Vale, London, W.

C. AND J. TUFFIN, COMMISSION AGENTS (Cut Flowers only).—4, Cross Court, Catherine Street, W.C., and Covent Garden Market.

WANTED, CUTTINGS of Evergreen and Oval-leaved PRIVET.—State price, and quantity to offer, to HUNTER AND McMORRAN, Nurserymen, Lanark.

" " 5 to 6 feet, at 42s. per dozen.

Every plant a perfect specimen. Excellent roots.

Special quotation for large quantities.

BEST LATE APPLE.

WE CAN STRONGLY RECOMMEND OUR NEW APPLE "NEWTON WONDER,"

as the best late Apple in cultivation; fruit keeps till June; large, well-coloured, perfect form, splendid cooking quality; tree a vigorous grower, free from canker, and very productive.

Awarded First-class Certificate, R.H.S., Dec. 1887.

NOW WIDELY KNOWN. DESCRIPTIVE CATALOGUE OF FRUITS ON APPLICATION.

J. R. PEARSON & SONS, Chilwell Nurseries, Notts.

GOLD MEDAL CHRYSANTHEMUMS.

My Collection has been awarded this season two Gold Medals, two Silver Gilt, one Silver, and one Bronze, the highest award in each case. The National Chrysanthemum Society's Gold Medal being the only one ever awarded to a Collection of Cut Blooms.

My Stock is in fine condition, and all who are interested in Chrysanthemums should secure a copy of my new, Descriptive, and Illustrated Catalogue, the most useful and complete ever published, which contains Cultural Articles by Mr. Charles E. Sheu, and Mr. H. Shoesmith; also Cultural Notes, by Mr. E. Beckett. Post-free, 7 stamps.

To Nurserymen, Builders, Local Boards, Vestries, &c. AND OTHERS WHO INTEND PLANTING TREES and SHRUBS THIS SEASON.

ROBERT NEAL, The Nurseries, Trinity Road, Wandsworth, S.W., begs to offer an extensive stock of FOREST and ORNAMENTAL TREES, SHRUBS, ROSES, GRAPE VINES, FRUIT TREES, CLIMBING PLANTS, &c., which being grown in the neighbourhood of London are especially suitable for Town Planting. Also a large stock of extra fine SEAKALE and RHUBARB, for forcing. CATALOGUES free on application.

Chrysanthemums. — Chrysanthemum.

TO MARKET GROWERS and OTHERS.—The four best kinds for Market: President Hyde, best yellow; Florence Percy, best white; Source d'Or, best bronze, the prevailing colour; Cannell's Elsie, best cream. My salesmen have repeatedly returned me as much again per box for the latter two sorts over all others. Splendid strong Cuttings, 2s. 6d. per 100, by Parcel Post. Also the following, at very low prices:—Lord Canning, splendid late white; Lacroix, Molyneux, Sunflower, Kocher, Florence Davis, Eynsford White, Beauty of Exmouth, and a host of others. Strong cuttings, true to name.—W. CONNELL, Lyme Regis.

Palma! Palma!! Palma!!!

J. W. SILVER, F.R.H.S., begs to call attention to his immense Stock of the above. In all sizes and best leading kinds, and offers, in large and well established clean and healthy plants, Phoenix rupicola, Kentias Belmoriana, Fosteriana, and australis; Cocos Weddelliana, Geomoma gracilis, Corypha australis, Latania borbonica, Pteleosperma Cuoninghamii, Arecia Banreii, and Seaforthia elegans, in 3-inch pots, 4s. per dozen; in 5-inch pots, from 12s. to 21s. per dozen. Catalogues and Packing free. Most extraordinary value.—**J. W. SILVER, F.R.H.S.,** Nurseryman, Seed, Rulh, and Plant Merchant, and Horticultural Sundriesman, Streatham and Norbury Nurseries, S.W.

NEW CHRYSANTHEMUMS.

We have great pleasure in announcing that we have acquired from Mr. T. H. Spaulding, New Jersey, U.S.A., the sole right of distributing his new set for 1894 in Europe. The plants arrived too late to produce exhibition blooms this season, and we were therefore unable to show them for Certificates, but the flowers we have had are wonderfully promising and fully bear out the raiser's descriptions. Mr. Spaulding tells us that this is the finest set he has ever sent out, which, coupled with his position as the first raiser in the States, will be ample proof of the value of these novelties. We have a good stock in hand, and shall therefore be able to supply strong healthy plants struck cool, which will bear full-sized blooms the first season. Catalogue containing these and the cream of all the other novelties, is now ready, free on application.

DEVELOPED

FRUIT TREES

IN BRITAIN.

Their larger-sized Trees Fruit at once.

"Kent—I may tell you I have bought fruit trees from five other large growers, and yours were far the best examples."

Special attention is called to their specimen Espalier Apples, Amateur's Standard Apples, Cordon, Gridiron, Double Cordon, and very large Pyramidal Apples on Paradise Stocks, all of which will fruit the first year of planting.

Large Pyramidal Plums, Peaches, and Nectarines, trained on stems 2 feet to 6 feet. Perfectly ripened and bristling with fruit buds.

"Middlesex.—Am delighted with the fruit trees—a splendid lot—so clean and robust, with fine roots."

Extra fine Peaches and Nectarines in Pots, 5s. to 10s. 6d.

Trained Peaches and Nectarines in Pots, to fruit at once, 5s. to 7s 6d.

Short-jointed and well-ripened Vines, &c.

And every kind and style of Fruit Trees.

Royal Jubilee Apple, fine standards, 3 6 each.

"Scotland—Apple trees received last week in splendid condition."

"Hants.—The specimen Pears came to hand, scarcely a twig broken."

"Cheshire.—Have found your trees more correctly named than any I have purchased elsewhere."

A grand lot of Scotch Fir, 4 feet to 6 feet, stout and well-rooted.

Specimen Austrian Pines, 4 feet to 8 feet.

Christmas Trees (Spruce) up to 20 feet.

"Kircudbright—I have had splendid fruit from the trees you sent me last year."

"Suffolk.—You have sent us a grand lot of fruit trees."

"Guernsey.—The fruit trees you sent me were infinitely better in every way than a neighbour's, who purchased elsewhere."

ROSE OF JERICHO.

(ANASTATICA HIEROCHUNTINA, Linn.)

RELICS of the Holy Land have in all ages been much prized by their possessors, and were often invested with an amount of superatition, which in this practical age seems to our enlightened ideas simply ridiculous. To this class belongs the Rose of Jericho, called also Rose de Marie, and Mary's Flower, on account of its being said to have expanded at the birth of our Saviour.

Although long known under the ambiguous name of the Rose of Jericho, no one has yet been able to solve the mystery, why a plant so unlike a Rose should have this designation. A writer in *Gartenflora*, Sept. 15, 1892, has discovered a plant, *Asteriscus pygmaeus*, which he says was long ago depicted on shields in old French heraldry, and though only recently described, was of early origin, belonging to the Composite family, which resembles much more a Rose than a closed Crucifer; from this, and the fact that the plant has hygrometrical properties, he deduces the idea that it is the true Rose of Jericho. On this slender hypothesis, we are asked to give up the idea that the plant known for hundreds of years as the Rose of Jericho is the true plant, because another is much more like a Rose, and also "that it must have become known to those valiant men in the East who, under unspeakable danger, were willing to deliver the distant States in the Holy Land out of the hands of the Turks." Were such slender premises to prevail, we should never be safe; for instance, when Dr. Thomson, in his excellent work, *The Land and the Book*, was describing a Syrian plant (p. 563), as a sort of vegetable, whose stems his muleteers were cutting up and chewing with great relish, he calls it the "wild Artichoke." Are we to suppose from this that we have the original Jerusalem Artichoke in the plant then described? or even that we should give up our name, i.e., Rose of Jericho, and call it by the name he dilates upon, which is the "Gulgal" of Scripture? We may here, by the way, remark, that this if established takes us back to 741, B.C., "the rolling thing" of Isaiah xvii., 13, carried before the whirlwind, and would give greater antiquity to the Rose of Jericho as a plant, though, of course, not in name. Although we cannot be certain, yet it is not unlikely that the plant which Josephus speaks of as running away from him who tries to gather it, or that the Rose plant in Jericho to which Syrach compared wisdom, because of it not being easily subject to corruption, is the *Anastatica hierochuntina*, Linn., by which name

botanists know the Rose of Jericho, yet we trace this plant to times of great antiquity, and think there is every reason to believe it to be the plant quoted in the above passages.

The plant was known to the early Arabian writers under the name of "Schad scharatelkaff," and the "Kaf maryam," of Elba Beitar reminds us of the Kaf maryam, or Mary's hand, by which name the plant is known in Egypt. Of late years in Rose de Marie we recognise the *Amonium* *Rose* *Sanctæ* *Mariæ* of Dioscorides and of *Journ. Bot.*, p. 258. The *Rosa Hierochontea* of Caspar Bauhin, *Rosa Hiericho* of J. Bauhin, figured in *Gerard's Herbal*, and also in 1613 in *Hortus Eystettensis*, and in *Lamarek's Illustration*, pl. 555, and in other places. The Rose of Jericho is a Cruciferous plant, growing in the Desert of Arabia, as well as in Syria, and has the peculiarity of curling its branches in dry weather, forming a ball of withered network, appearing quite dried up and dead, but on the appearance of rain or immersion in water, the whole plant (however dry it may have been), expands, assumes the aspect, though not the reality, of a living plant; hence the derivation of the generic name *Anastatica* from the Greek "anastasis," resurrection. There were, a few years ago, two specimens in the Museum of the Royal Botanic Garden, Edinburgh: the writer once heard a distinguished Eastern traveller explain to Mr. Sadler (the then Curator of the Botanic Society) that these were fair specimens, although he had met with larger. He said they were often a great impediment to persons when travelling in the deserts, when they accumulated in great numbers, and were blown about by the wind; they often got under and around the horses' feet, and greatly impeded their progress, and it was often with very great difficulty they were got rid of—indeed, sometimes they had to wait for a change of wind, when these light but numberless impediments were blown in a different direction.

Similar experiences are related by Dr. Thomson, who adds:—"Hundreds of these globes, all bounding like gazelles in one direction over the desert, would suddenly wheel short round at the bidding of a counterblast, and dash away with equal speed on their new course."

The Rose of Jericho is a small plant, the stems of which never rise more than 4 or 5 inches from the ground; the stems are covered with leaves and loaded with flowers, which have a resemblance to Elder flowers without their fragrance. It sheds its leaves and flowers as it withers, and the stems, bending in the middle, become entwined and form a kind of globe. This happens during great heat, but in moist and rainy weather these again open and expand to liberate the living seed.

In a country of ignorance and superstition, the alternate shutting and opening of this plant is miraculous to the inhabitants, who, devoid of philosophy, do not judge with the critical eye of more learned nations; they therefore ascribed this to an operation of heaven to make known the events of this world. With this impression the people from the various districts visit and examine the plants when they are about any special enterprise, if intending to undertake a journey, form an alliance, or conclude any affair of importance, or on the occasion of the birth of a child; if the stems of the plants are open they do not doubt of success, but if shut they renounce their project, and look upon the omen as being bad and dangerous to their interests.

The plant neither rots nor withers, but after a dozen years of complete dryness and apparent death, its "resurrection" is easily manifested by

immersion in luke-warm water. Other plants have the same hygrometric property, one of the best is *Selaginella lepidophylla*, a native of Mexico, which curls in the form of a rosette, and when dry curls up like a ball; this opens again when wetted. *W. Etherington Dixon, Assoc. Bot. Soc., Edin.*

FLORAL DECORATIONS.

By far the larger half of the flowers that are cultivated are grown for these purposes. A few words, therefore, on pleasing and effective ways of utilizing them may not be altogether out of place.

The first point to aim at, whether in the arrangement of a conservatory or the embellishment of a dinner-table, is the general effect. Strive above and before all to obtain a harmonious and beautiful whole, and, if need be, sacrifice minor details to that object. Do not, for the sake of showing off a magenta *Azalea indica*, place it among a group of *Amaryllis*; nor put in close juxtaposition a *Cattleya Skinneri* and an *Imantophyllum*; rather let one or the other blush unseen in another house. Avoid planting *Zionisa*, *Pentstemons*, and *China Asters* close together, or using orange *Marigolds* as a background for *Geraniums*, or surrounding a bed of *Phlox Drummondii* with a border of purple *Violas*. I should hardly have ventured on such prohibitions as the foregoing, had not my personal experience supplied instances of their disregard.

But the form of decoration which demands the most taste and care is undoubtedly the adornment of the house, and specially of the dinner-table; a task which not unfrequently falls to the gardener's lot.

I have seen very beautiful table decorations which had involved but little outlay and no great profusion of flowers; while others, on which neither expense nor blossoms had been spared, were either stiff or insignificant.

White *Van Thol Tulips* look exquisite arranged with their own leaves in small silver bowls, or in low vases of white china, especially if the table-centre be of soft silk, white pale green, or salmon pink. Scarlet ones might be placed in rustic baskets on a ground of pale blue or cream colour.

Or again, a rather large vase of Venetian glass in the centre, filled with gold and bronze *Chrysanthemums* loosely arranged, with fronds of some trailing fern falling over the table. The other day I saw a table entirely decorated with enormous blooms of that loveliest of Japanese, *Bouquet des Dames*, each flower cut off short and stuck bolt upright, without a vestige of greenery in a specimen glass. One could not help thinking how much better their beauty would have been displayed had they been massed in three handsome vases down the middle of the table, and supplemented by little Ferns in dainty china pots.

An ideal table in honour of a bride could be decked with *Colognes* or *Lily of the Valley*. The former should be arranged in shallow glass troughs, and if some leaves and bulbs of the plant can be spared, the flowers will look doubly well, whilst a too flat effect can be avoided by the introduction of some *Liliputian Palms*. Wide bowls filled with *Roman Hyacinths* or *Lily of the Valley*, interspersed with tall slender glasses, each containing a few sprays of the same, look very lovely; and *Crocuses* grown in shallow tins covered with moss, are bright and pleasing, though, as these flowers support the "early closing movement," they are not adapted for use by candlelight. [They will re-open under such circumstances.]

Silver decanter stands, which many people possess but do not use, are treasures in the hands of the skilful decorator, who fills them with *Calanthe* and *Asparagus*, *Ferne*, *Azalea mollis*, and *Adiantum Farleyense*, or coloured leaves and berries according to the season. The larger Lilies, as *lancifolium* and *auratum*, are seen at their best in those old-fashioned wine coolers which repose peacefully in the family plate chest, while a silver cake-basket piled high with *Roses* is a thing to dream of.

Hitherto, I have only spoken of tables decorated in one colour or with one flower, because, where the greenhouses can supply sufficient material, or the owner's purse is elastic, I consider them at once the most effective and the easiest of execution. In blending two or three varieties of flowers, care should be taken that the species are well assorted. For instance, I do not consider that either *Tulips* or *Daffodils* look well with *Orchids*, and should avoid combining scarlet *Poppies* with *Tea Roses*, or *Sweet Peas* with early *Chrysanthemums*, as, though the colours might be harmonious enough, the general effect would be one of incongruity.

Taste and originality are the main requisites in floral decoration, two qualities in which no one will willingly acknowledge himself deficient! Much however, can be done in this as in everything else by that capacity for taking pains which is sometimes regarded as the principal constituent of genius *A. W., Kendal.*

RICHARDIA REHMANNI (THE PINK-FLOWERED CALLA).

AN additional interest has been given to the genus *Richardia*, commonly known as *Calla*, by the discovery in the neighbourhood of Natal of a species with rose-coloured spathes. It was first introduced into the Cambridge Botanical Gardens under the name of *R. æthiopica rosea*, where Mr. Lynch flowered it in 1888, but there was no trace of rose in the flowers. It was then identified at Kew as *R. Rehmanni*, a species peculiar in having lanceolate and not hastate leaves, the latter being characteristic of all other species of *Richardia*. Recently Messrs. Krelage & Son of Haarlem introduced and flowered it, and Mr. Lynch's experience was repeated at Haarlem, though there a slight indication of rose-colour was perceptible in the spathes. Meanwhile tubers of the plant had been sent home by a Dutch correspondent, who described the flowers as rose-coloured. Finally, tubers of it were sent to Kew by Mr. Medley Wood, Curator of the Durban Botanical Garden, who also said the spathes were rose-coloured, and he has since forwarded to Kew a coloured drawing of the flowers produced by a plant he grew at Durban. Through the kindness of the Director of Kew, this drawing was exhibited before the Floral Committee of the Royal Horticultural Society last Tuesday, and the following communication from Mr. Wood to the Director was read by the chairman:—"I send to-day a coloured drawing of the flowers of the 'Pink Aroid' of which I sent you tubers a short time ago. The drawing was made by my nephew from a cultivated specimen. I have compared it with the original, and find that the colour is in no way exaggerated, but rather the reverse, since three or four days after the drawing was made the spathe became more decidedly suffused with pink. Mr. M. S. Evans has also seen it, and agrees with me that the drawing is true to nature. It is about natural size. The leaf is exactly similar to that of *R. Rehmanni* of which plant it will I think prove to be a variety."

The picture shown represented a flower of about the same size as the dwarf *R. æthiopica compacta*, the spathe being 4 inches long, trumpet-shaped, with a tail-like tip nearly an inch long, the colour being dull rose with a few lines of green outside, whilst inside it was of a darker shade, almost rose-purple. A longitudinal section showed it to be deep crimson at the base of the trumpet, and the slender yellow spadix less than two inches long.

It is therefore quite evident from all this that there is a "rose-coloured *Calla*" in Natal, but it is at the same time remarkable that the plants imported as rose-coloured so far, have shown scarcely any trace of that colour when flowered here. The plants sent to Kew by Mr. Medley Wood are now in vigorous growth, and we shall watch the development of their flowers with interest.

Although this *Richardia* has not the attractions of the useful old *R. æthiopica*, or the new yellow spathed *R. Elliottiana* and *R. Pentlandii*, it is a

plant worth looking after by hybridisers, and it is certain to find many admirers among those who take an interest in the novel and unorthodox among garden plants.

IVIES.

THE varied and extremely beautiful forms of variegated *Ivies* now obtainable are not sufficiently appreciated, and if the accompanying notes bring them more forward my object will be attained. One of the most valuable traits of the *Ivy* is its equal freedom of growth whether in sun or shade. It also seems impervious to town fogs and smoke, and will grow well in suburban gardeos and beneath trees, where few other subjects are satisfactory. A bare spot may be quickly covered with *Ivy*, both in its green and variegated forms; while for hiding a rough fence or broken wall, there is nothing to surpass it. This clinging shrub fits in with ruined and dilapidated surroundings far better than any other subject that I am acquainted with. All through the year *Ivies* have a fresh and bright appearance; as a natural screen to windows in towns I have seen the *Ivy* used in a most charming manner. If planted against the wall they can be so easily trained along a few stout wire supports, and form a screen of 1 to 2 feet high as may be desired. Lately, I observed a house in the suburbs of a seaside town, the whole front of which was covered with the *Irish Ivy* (*Hedera Helix canariensis*). As a screen to the lower part of the windows there were plants of *Hedera maderiensis variegata*, a very bright silver variegated form. This had a pretty appearance, and must have been lighter for the room than if the common green had been trained in its place.

Ivies grow in very little soil, and if kept well watered and syringed, are some of the grandest town climbers we possess. There is scarcely any limit to the uses to which they can be put, and I strongly advise the planting of some of the vigorous-growing variegated forms, and of which there is now a large variety. As pot plants, grown over a trellis or globe, they are seldom seen, yet there is no plant more amenable to this style of training, nor more lasting when obtained. The support they would obtain from the small roots which penetrate every interstice they can find when growing against a wall, may be provided for to a great extent by frequent syringing, and this will also keep the foliage bright and clear. An occasional dose of liquid-manure will be found a great help. *A. P.*

CULTIVATION OF HARD-WOOD PLANTS.

(Continued from p. 685.)

CHORIZEMAS.—There cannot be two opinions as to the showy character of these profuse-flowering semi-succulent greenhouse plants when in their full beauty in April and May. They are almost without an exception indigenous to West and South-west Australia, but are classed in gardens with New Holland plants. The plants are not so generally grown as was the case from thirty to forty years ago, when no collection of note would be without the best varieties; but fashions have changed of late years, and many a good plant now remains neglected. If cultivators only knew, however, of the extreme value of the more vigorous-growing varieties of *Chorizema* as pillar, roof, or wall plants, their culture would, I am quite persuaded, be again taken up. For training up pillars or wire arches in a conservatory, a more suitable plant can hardly be chosen. In this way I have had *C. cordatum splendens* one mass of growth, and flower too, in its season, extending fully 10 feet from the soil. The plant in question was planted out in a border with *Camellias*, and was quite at home there, growing in peat and loam. Through being planted out, it lasted in flower much longer than in pots, and commenced early in the year, continuing in beauty for quite three months. When treated in this way, the growths should only be lightly tied-in, so as to afford them support.

There are many conservatories in which room could, I think, be found for this mode of culture, and a sunny position is better than the reverse. As pot plants, they are seen to much better advantage when of medium or specimen size, although small plants also are very pleasing, by reason of the distinct and bright colours of their Pea-like blossoms. The strongest-growing kinds are managed more readily if trained on wire trellises, and the medium-growing species by means of slight sticks. The growth of healthy plants is very free, which will render necessary some amount of pruning; for most plants grown in pots, this should be done with moderation, otherwise harm will be done. The pruning can be modified considerably by a judicious system of thinning-out of the weakly spray-like or the exhausted shoots immediately the plants go out of flower; and when this is done, not nearly so much of the finer wood will have to be touched with a knife, shortening of the longer shoots and closer pruning of the smaller ones being then the better course. An indiscriminate use of the knife, after the manner of cutting a hedge, should not for a moment be entertained. It is better to let the shoots grow away freely all the summer, leaving the tying into proper form till the late autumn. Any extra strong shoot which looks as if it would rob the weaker ones, should be stopped at the points. When any re-potting is required, it should be done early in the summer, and soon after flowering is past in fact, so as to have as long a season for re-establishment as possible. *Chorizemas* should not be confined to small pots so as to starve the plants, it is better to grow them on into fair-sized specimens, then with proportionate pot-room shifting will be far less needed. Whether potted or not it is better to keep the plants under glass for a time until the young growths are well advanced, than to stand them outside immediately the flowering is over towards the end of May. By the end of June they should be fit to stand outside in a sunny position until the middle of September, if the weather still remains open and fine. From the time of pruning and potting, the syringes should be occasionally used, both to induce young growth and to keep in check red-spider, which besides white-scale, is about the only insect that gives trouble. Remedies have been alluded to in other instances. At no time should a close atmosphere be allowed during growth, and a favourable position in the greenhouse is all that is needed, the object being to secure a hard—not a sappy—growth. The watering needs to be attended to with care, in this respect the treatment is about the same as that of *Ericas* and *Epacris*. The object should be to avoid both extremes in this item of culture, it would not do to let a plant droop often during growth; on the other hand, but a moderate supply is required after housing until the flowering season comes round again. Good, sound, fibrous peat is the staple soil to use, such as one would choose for *Azaleas*, with no fine or pasty matter left upon the under side, as when the sods are cut too thickly. A dash of fibrous yellow loam would be a good addition when the peat is not first-rate. Silver sand should also be freely used. As in other plants of hard-wooded growth, firm potting is most essential. In alluding to the watering, I should have added that no manurial stimulants are ever really needed such as would excite growth too freely when other details are well attended to.

The best varieties are *Chorizema varium*, of which *C. varium Chandleri* may be considered as the finer form for general cultivation; it is one of the best growers of any, the flowers are of a bright orange and scarlet, the racemes in vigorous examples being much branched. *C. Lawrenceanum* is one of the best to grow into a specimen upon a trellis, or for training upon a pillar or near the glass; being about the strongest grower of any, it is not advisable to plant this variety out unless there is plenty of room for its extension—it has rather brighter coloured flowers than the preceding variety, having, like it, the same tendency to produce branched racemes. *C. cordatum splendens* is one of the most profuse in flowering, producing racemes of bloom of great

length when planted out; it is not of so bright a colour as either of the others, but the contrast between the orange and the red is more marked. *C. Henchmanni* is in growth quite distinct, being of a greyish or glaucous shade of green; the entire plant is of less vigour, having more of a shrubby habit; the flowers are scarlet, thus being also distinct in this respect; possibly through the characteristics of this plant, it is more predisposed to mildew than any of the others (sulphur being the remedy). *C. Lowii* is a variety of more recent introduction, but whether it be a new species or not I am unable to say; I am disposed, however, to think it is an improved form of *C. cordatum splendens*; the two colours, orange and scarlet, are both unusually bright—this variety was put into commerce only a few years back by Messrs. H. Low & Co., of Clapton, N.E.; it flowers freely whilst still of small size. *C. ilicifolium* is another quite distinct species, with yellow flowers and a rather vigorous growth.

GOMPHLOBIUMS.

These are not unlike the *Chorizemas* in flower, but the growth is different, being much more slender, with far less vigour in every way. Compared, too, with the *Chorizemas* as regards culture, they are more difficult to manage. A well-grown plant is now rarely seen. The last specimen I noted was at the Regent's Park more than twenty years back. The *Gomphlobium*s are more continuous in flowering, whilst there is never a mass of bloom open at one time. *G. polymorphum* is one of the best, the flowers are scarlet, purple, and yellow; *G. splendens* is a form of the preceding; *G. barbigerum* is somewhat more bushy than *G. polymorphum*, which is of a scandent growth, its flowers are yellow and larger in size. Paxton gives twenty-one varieties in his *Bot. Dict.*, all of which, with one exception are put down as possessing yellow flowers. These also are "New Holland" plants, but their particular locality is more south and south-east than the *Chorizemas*—both are, however, quite at home in the greenhouse. *H.*

(To be continued.)

HILLINGTON HALL, NORFOLK.

[SEE SUPPLEMENTARY ILLUSTRATION.]

THIS pleasant home of the ancient family of the Ffolkes lies about half way between the villages of Fitcham and Hillington, the latter being also a station on the Midland and Great Northern Railways, about seven miles north-east of King's Lynn. Hillington is also on the main road to Walsingham Abbey, a powerful and popular attraction of olden times.

Our space does not allow of our dilating on the antiquarian interest of the place, though the proximity of Hillington to the ancient shrine of Our Lady at Walsingham Abbey, and the prominence of the four ancient crosses outside the lodge gates on the Hillington Road, furnish strong temptation. Few more characteristic links could be found to bind the present to the past than such a rich embellishment of this Gothic lodge, with its two towers with venerable crosses. Sufficient mystery also hangs over their past history to invest them with special interest. The cross with the longest shaft of the four is doubtless the original village or parish cross of Hillington, and is still standing on the spot it has occupied throughout many centuries. The second cross was moved from the point where the Swaffham and Lynn roads join the Fakenham road, about a quarter of a mile from the Hillington lodge-gates; the third probably from St. James's Chapel, which stood in the olden times about a mile west of the Lodge on the Lynn road; the fourth may have been from the market-place of King's Lynn, or some other parish, as all are said to have been collected in the district.

Entering the lodge, we soon reach the Hall, from the front door of which the Fitcham Lodge, with *Ivy*-clad towers, and of similar character to the other, is distinctly visible.

Hillington Hall, a most imposing and picturesque building of the garden front of which on the south side of the house we give an illustration, was built in 1672 on the site of the Grange, a much older house, by Richard Hovell, whose father purchased the estate in the reign of Queen Elizabeth. The first coat of arms to Martin Ffolkes was granted in the reign of James II. The internal arrangements and furnishing of the Hall are in harmony with its stately and dignified exterior; it also contains many notable portraits. The Technical Education Lectures on Horticulture for the district are, by permission of Sir W. and Lady Ffolkes, given in the Hall by Mr. Bunyard, late of Ashford, and are well supported by all classes and conditions.

Before noting the main features of interest in the pretty gardens at Hillington Hall, a few sentences must be devoted to the general features of the demesne. The Park, though not very extensive, contains some old Oaks of noble dimensions, several of those near the Hall probably more than a thousand years old. There is also a wise and judicious blending of evergreens and deciduous planting in the park, which links the old with the newer elements of the landscape, and gives the whole a pleasing and varied character. The next point is the graceful disposition of the two approaches to the Hall from the two lodges, thus converting the two approaches into a thoroughfare right past the Hall—a matter of great practical moment in places so liberally thrown open to the public as Hillington. Not only the park but the pleasure-grounds are thrown open to visit and to play games in, hot water being provided for visitors throughout the summer months. Such thoughtful liberality, and the close proximity of Hillington to Sandringham, bring hosts of visitors throughout the summer season. There are several artificial lakes here, the largest and most beautiful being on the north side of the Hall. Our illustration shows the boundary walls, with its base, also flanked by a much smaller lake on the garden front of the Hall, with the well-wooded but more modern part of the park beyond. The half-dead deciduous tree to the right of the Hall is an Ivy-clad Oak, which forms a charming contrast with the adjacent glaucous Atlantic Cedar, as well as with the Hall itself. There is another and a smaller common Cedar of Lebanon nearer to the Hall than the glaucous one, which may just be seen in the illustration; and other masses of trees and shrubs, which are needed to tone down the lofty and imposing massiveness of the architecture of the Hall. The boundary and retaining wall bordered by the straight lake is but little raised, and relieved, as shown, by some elegant vases. This walk runs along to the end of the terrace into the wood, and proceeds towards Hillington station, past Nut Island, which until it was linked on to the main land by a bridge, used to preserve the nuts from the squirrels. A main walk almost or wholly parallel with this runs along the front of the mansion through the kitchen gardens; the further end to the right terminating in a mass of shrubs, and the other end in an old orchard containing some very old and fine Apple trees. A statue, a seat, one or more Rose hawes or arches, a summer-house, vase or fountain, would furnish striking termini for this fine walk. Herbaceous and other plants, flowers and bulbs, are planted in masses and groups along the borders of this main walk as it proceeds through the well cultivated and fully-stored kitchen gardens into the old orchard at the far end. The main walk across the kitchen garden from the vineria and other glass-houses to the retaining walls with its base against or in the water, as seen in our illustration, is furnished on either side with a border devoted to choice herbaceous and other flowers, shut off from the vegetable by espalier Apple and other fruit trees. This is mainly furnished throughout the flower season with choice herbaceous white and pink Peas, white and other herbaceous Phloxes, Sweet Peas, Dahlias, Tiger and other Lilies, Gladiolus, Hyacinths, and other bulbs.

Each main division of the lawn or garden front

is furnished with massive beds of Rhododendrons planted in peat. One of these, however, has recently been removed to make way for a large collection of choice new varieties of Iris from Japan, which with other Iris seem to thrive here. A group of scroll beds alike on each half of the lawn, consisting of nine or ten, each designed from the family arms, of crosses, crescents, Fleur de Luce, and other heraldic patterns, all now planted with bulbs, the early Forget-me-not, *Myosotis dissitiflora*, &c., promising a chaste glow of colour in the early springtide. These are furnished with the usual bedding plants throughout the summer and autumn, Pelargoniums, Begonias, Ageratum, variegated Alyssums, Lobelias, &c. Among the former we noted a capital stock of the old sweet-scented Lady Plymouth Pelargonium, now too seldom seen in flower gardens, furnished either on the old-fashioned massing or the newer mixed system.

The old orchard, too, is just where one would expect to find it in a garden of this style and character, the Apples holding their own bravely against the severe encroachments of timber trees. We noted some fine trees of the following among other old favourites, and were pleased to find great abundance of fruit of the highest quality in store from these venerable holders of this orchard against all comers for sixty or more years:—Beauty of Kent, Scarlet Nonpareil, Ribston Pippin, London Pippin, Cockle Pippin, Blenheim Orange, Gravenstein, Leathercost, King of the Pippins, the Brandy Apple, &c.

The walls were also well furnished with Pears, Plums, &c., and thriving crops of Gooseberries, Currants, Raspberries. Strawberries were everywhere in evidence, Mr. Forder, the gardener at Hillington, speaks well of Noble and Scarlet Queen, while growing largely such established sorts as President and Sir Joseph Paxton.

The Orangery is quite a characteristic and imposing structure on the garden side of the Hall, though it is hardly seen in our illustration. It is probably more than sixty feet long, fifteen wide, and twenty high, and so skilfully linked with, rather than on to, the Hall, as to form a portion of it. It contains four very fine old standard Myrtle trees in tubs, six fine orchard trees, and one Citron, planted out, laden with fruit, and pictures of good health.

A curious tale is tacked on to one of those, and is still duly recorded in the district. Long, long ago, an old lady in the neighbouring parish of Fitcham sowed one or more seeds of an Orange in a pot. When cold set in, she placed it in the brick oven for shelter. Meanwhile, a young pig arrived on the scene, and was also sheltered in the oven. When the old lady opened her oven again, lo and behold, the orange tree had already begun to grow, and its owner hastened to carry it down to the Hall and present it to Sir Martin Folkes, the owner at the time. There it has shared in the fortunes and happiness of the Ffolkes' family ever since. What became of the pig we know not.

The roof of the orangery, as well as the back walls, &c., are largely clothed with the chaste Clematis indivisa, Lapagerias, Cobaea scandens, Hæthrothamnus, Gloire de Dijon and other Tea Roses; Maidenhair and other Ferns, Azalea amœna, &c., being placed over the Orange-tree borders; the glasshouses and back-walls of pits and fruit-houses are also partly or wholly devoted to such plants as Hoya carnosa, Heliotrope, Camellias, Bougainvilleas, Stephanotis, Encharis, Chrysanthemums, Callas, Pelargoniums, Poinsettias, Lilies of the Valley, Violets, Christmas Roses, &c. Two plants deserve special commendation and notice over a roof of a cool stove fully furnished with two fine plants of the *Stephanotis floribunda*. One of these, the well-known free-blooming Elvaston variety; the other, a seedling brought by Lady Ffolkes from abroad, that had not bloomed for several years. A few years ago Mr. Forder planted it out in the same house as the other, and now the shy seedling seems as free-flowering as the prolific, the flowers being rather the larger of the two. The Bougainvillea is grown on the back of a cool plant-stove or Melon-house. Throughout the summer months the back lights are slipped down, and the growth, a yard or two long, is made in the open air,

giving the curious blossoms a richness and a glow of colour that can only be reached under such full exposure to light and air. As winter approaches, the stray shoots are cut off, and the lights run up over the Bougainvillea for the winter.

The vinerias and Peach-houses are old-fashioned, but yield good crops, and every inch, on rafter and wall, is filled with Grapes, Peaches, Nectarines, Figs, Tea Roses, and other plants or flowers. Two of the vinerias are chiefly devoted to Hamburgs, and one, more recently planted, to Muscats, Alicantes, Gros Colmar, Foster's Seedling. The Grapes were all cut and bottled, and promised to yield a plentiful supply well into the New Year. The Vines were also in promising condition.

Returning to the station, through the well-timbered, thickly-pleasanted plantation that leads past Nut Island, we observed some of the finest boles of Scotch Fir ever seen on the top of a bank, with a canal on one side and a ditch on the other. On one of these there was a fasciated branch almost as large and round as an ordinary haycock, in which a colony of wild ducks were said to have been hatched last summer, though it was 8 or more feet above the water-line. But the Midland train was due, and this, and the fact that the Fitcham Lake was crowded with seagulls when we left Hillington, warned us to catch it for Lynn or London. F.

CUCUMBER CULTURE.

I BELIEVE it is the experience of all Cucumber growers who cultivate extensively for market, that after the erection of a new glasshouse, they can safely reckon in the first year upon a good and productive crop; the second year, a moderate crop only will be obtained; the third year, a crop scarcely worth the saving will be the result; and after this, no further crop of Cucumbers can be grown in the building.

To those who have to depend largely for their livelihood upon the produce of their glasshouses, this failure of Cucumbers is naturally a serious difficulty.

The above fact having been brought under my notice, I, with the co-operation of two growers of Cucumbers on a large scale, tried during the past season a series of experiments, and the results obtained appeared to show that it is not lack of plant-food in the soil, either mineral or nitrogenous constituents, that causes the failure; neither is it disease-germs deposited in the material of the building, because in one case the house was thoroughly disinfected and lime-washed, and with no apparent result.

Will those growers who have had any experience upon the subject of Cucumber failure, kindly state through the pages of this Journal their opinions upon the cause of failure of the crop? and having by these means possibly discovered the cause of failure we may have a better chance of finding a remedy for it, which I doubt not would be a boon to many horticulturists. J. J. Willis, Harpenden.

RHODODENDRON CATAWBIENSE AT HOME.

EARLY in July of the current year I had an opportunity of seeing Rhododendron catawbiense in its native habitat, and, moreover, in the very locality where, nearly a century ago, it was discovered by Fraser, and whence it was introduced by him to European gardens. The accompanying illustration, prepared from a photograph taken by Mr. Elmer H. Edson, represents a Rhododendron "park" near the summit of Roan Mountain, in Eastern Tennessee and Western North Carolina. The hotel at the top of Roan Mountain—6342 feet above sea-level—is said to be the highest human habitation in the United States east of the Rocky Mountains. Professor Mitchell, who lost his life on the mountain which bears his name, wrote in the *American Journal of Science and Art* in 1839:—"With the exception of a body of granitic rocks looking like the ruins of an old castle, near its south-western extremity, the top of the Roan may be described as a vast meadow (about

9 miles in length) with some interruptions . . . without a tree to obstruct the prospect; where a person may gallop his horse for a mile or two, with Carolina at his feet on one side, and Tennessee at the other, and a green ocean of mountains raised into tremendous billows immediately beneath him." My route had taken me from Washington to Johnson City, a small town in Tennessee, upwards of 450 miles from the Capitol. From Johnson City a narrow-gauge railway runs through the Doe River Cañon—one of the most picturesque railway rides in the United States—to Roan Mountain Station,

On rocky, open bluffs, *Ceanothus americanus* was very conspicuous, also *Kalmia latifolia*, *Hydrangea arborescens*, and a host of shrubs, &c., cultivated in British gardens. *Magnolia Fraseri*, *M. acuminata*, *Ericus flava*, the Tulip-tree, &c., were duly noted and admired, as the train passed along; but a mere list of the beautiful and interesting species observed would occupy too much space for these columns. In this Alleghany region now stands the largest body of hard-wood timber in the temperate zone. A good idea of the physical conditions, &c., can be formed by reading the following extract from Dr. Asa Gray's

condition, and composed of a greater variety of genera and species than in any other temperate region, excepting Japan.

And in their shade are the greatest variety and abundance of shrubs, and a good share of the most peculiar herbaceous genera. This is the special home of our *Rhododendrons*, *Azaleas*, and *Kalmias*—at least, here they flourish in greater number and in most luxuriant growth. *Rhododendron maximum*, which is found in a scattered way, even as far north as the vicinity of Montreal, and *Kalmia latifolia* (both called Laurels), even become forest trees

FIG. 118.—RHODODENDRON CATAWBIENSE AT HOME.

whence a mountain-road about 12 miles long leads to Clondlands, the hotel at the top of Roan Mountain. On the steep rocky slopes of the Doe River, *Rhododendron maximum* was in flower at the time of my visit, and constituted in some spots the bulk of the vegetation. According to Professor C. S. Sargent in his magnificent work, *The Sylva of North America*, this species occurs up to an elevation of 3000 feet above the sea-level, and attains its greatest size on the lower slopes of the high mountains of Tennessee and the Carolinas, and where it forms thickets hundreds of acres in extent, impassable to man, and the secure retreat of the bear, the fox, and the wild cat.

address to the British Association at Montreal in August, 1884:—"But at this season a more enjoyable excursion may be made to the southern portion of the Alleghany or Appalachian mountains, which separate the waters of the Atlantic side from those of the Mississippi. . . . In Pennsylvania, where they consist of parallel ridges, without peaks or crests, and are of no great height, they are less interesting botanically than in Virginia. But it is in North Carolina and the adjacent borders of Tennessee that they rise to their highest altitude, and take on more picturesque forms. On their sides the Atlantic forest, especially its deciduous-leaved portion, is still to be seen to great advantage, nearly in pristine

in some places. More commonly they are shrubs, forming dense thickets on steep mountain sides, through which the traveller can make his way only by following old bear paths, or by keeping strictly on the dividing crests of the leading ridges.

Only on the summits do we find *Rhododendron catawbiense*, parent to so many handsome forms in English grounds, and on the higher wooded slopes the yellow and the flame coloured *Azalea calendulacea*; on the lower, the pink *A. nudiflora* and the more showy *A. arborescens*, along with the common and wide-spread *A. viscosa*."

Among the *Rhododendrons*—as shown in the illustration—*Lilium Grayi* occurs here and there,

and I had the good fortune to be shown the plant in flower by the Rev. Dr. Edson; it is now, however, far from common, having been ruthlessly dug up (almost exterminated, in fact) by collectors. In cultivation at Kew this species attains far greater proportions than in its native habitats. In open spots *Leiophyllum buxifolium* forms dense masses from 6 inches to 1 foot in height, and the Bluets (*Houstonia serpyllifolia*) grows amongst the grass, and makes, in some spots, a beautiful carpet of blue. On rocks and in stony spots, *Houstonia purpurea* occurs in solitary tufts, as do also *Saxifraga leucanthemifolia* and *Potentilla tridentata*. Amongst the shrubs on the top of Roan Mountain—in addition to those already named—are *Vaccinium erythocarpum*, a species with red *Oxycoccus*-like flowers, *V. Constabilei*, *Menziesia ferruginea* var. *globularis*, *Diervilla trifida*, &c. *Abies Fraseri*—shown in illustration—and *Picea nigra* are the only two Conifers. *Osmunda Claytoniana* is very common.

As I am afraid that I have already taken up too much space I must conclude, although the number of interesting plants noticed was great—only a small selection of them being mentioned in these notes. *Geo. Nicholson*. [Our readers would like to see more space filled by Mr. Nicholson. Ed.]

NOTICES OF BOOKS.

ROMANCE OF LOW LIFE AMONGST PLANTS: FACTS AND PHENOMENA OF CRYPTOGRAMIC VEGETATION. By M. C. Cooke, M.A., LL.D., &c. (Society for Promoting Christian Knowledge.)

THE title of this book is its most objectionable feature. It is sensational—it is untrue. The romance has been framed by the credulity or the imagination of mankind; while as to "low life" among plants, it does not exist. It is amongst human animals that we look for that unlovely manifestation of energy, and plants are entirely exempt from it. What Dr. Cooke has done in the present volume is to present in popular language an account of some of the more salient and remarkable manners and customs of cryptogamic vegetation. With the statement of sober fact Dr. Cooke has incorporated the fables and fancies of bygone ages interesting enough to the student of folk-lore and mythology, but which it were well to omit from text-books, except, indeed, in the rare cases where it is possible to give a rational explanation of them. The "symbiosis," or

Dr. Cooke has it, "dualism" of Lichens is treated by him as it were really romance. Schwendener's "hallucination" has, we are told, "almost subsided into oblivion." "The hypothesis" [we had supposed it a proven fact], "has so few adherents, and those few do but quite unnecessary and impolitic to reopen the discussion, or repeat the arguments against it which have never been successfully controverted." An examination of modern text-books would, we think, prove that no other account of the nature of Lichens than that so unceremoniously dismissed, is now taught in our colleges. Very possibly in the future the facts will be found susceptible of a different interpretation, and the adoption of another terminology will serve to reconcile those who have and those who have no hallucinations. Meanwhile, there are the facts. A similar scepticism is manifested in the case of "heterocœcium," or the existence of the same parasitic plant on different host plants, but in very different aspects. This too we had fancied has been made the subject of repeated demonstration, but there are still some sceptics left, says Dr. Cooke, and we are bound to listen to them with all consideration. It is, we think, rather unfortunate that controversial topics should be introduced into a work of this character—one intended not for professional readers but for the laity.

The record of differences amongst the doctors only serves to confuse the student, and to give those hostile to science an opportunity of sneering, an excuse for aiding and abetting quackery of all

kinds, and of opposing methods of research, which do not commend themselves to their uninformed judgment.

Dr. Cooke estimates roughly the number of recognised species of Cryptogams at about 80,000, and he has certainly succeeded in showing "that amongst the humblest organisms in creation there are marvels and mysteries, lessons and suggestions, facts and phenomena, which are worthy the attention of young and old, and sometimes almost as fascinating as a fairy tale,"—with the additional interest we should add, of being themselves true, or as furnishing the clue to the discovery of the truth.

RECENT BOOKS ON FUNGI.

First in order of publication is the first volume of Professor Oudemans' *Revision des Champignons dans les Pays-Bas*,* which is really a collection and revision of the numerous contributions to the mycology of the Netherlands, which Professor Oudemans has published at intervals throughout a long series of years. It is an imposing volume, excellent in typography, and, we doubt not, equally excellent in its contents. The arrangement adopted is precisely that of Saccardo's *Sylloge*, and consequently all of Fries's sub-genera of *Agaricus* are elevated to the rank of genera. The novelty, introduced for the first time, is that all the species in each genus of the Hymenomyces are arranged at the commencement of the genus in the form of a "key," with the descriptions in full, so that they are not repeated under the several species afterwards, that portion being reserved for the synonymy, habitats, and localities. It is also noteworthy that no measurements of spores are given in the Hymenomyces. All the text is in French, which is certainly preferable to Dutch for the purpose.

The chief interest which this volume will possess with most of our readers will be in its affording a ready comparison of the fungus flora of a neighbouring continental country with our own, and in this direction a few notes may be made. If we take the entire list of Agaricini, or gill-bearing fungi, we shall find that the Netherlands possess a total of 585 species, against our own 1400 species. The residue of the Hymenomyces number 274 species, against our own 548 species, or about one half. In the Gastromycetes, or Puffball and Stinkhorn families, there are thirty-nine species, as against our seventy-eight. And in the Uredineæ and Ustilagineæ, the Netherlands possess 190 species to compare with the 257 British species, a nearer approximation than in any of the other of the above groups. The explanation of these great differences must be sought in the different characteristics of the two countries.

The second work to which we call attention is the second and third volumes of Massée's *British Fungus Flora*,† the first volume of which we noticed in 1892. It was at first proposed to complete this work in three volumes, but this, as we pointed out, was impracticable, and now a fourth, or supplementary volume is proposed, in order to include all the Ascomycetes, which cannot amount to a smaller number than the Agaricini, or gill-bearing fungi. Be that as it may, we have in the volumes before us the completion of the Hymenomyces, in the first half of volume iii., and the Moulds, or Hyphomyces, fill the residue of that volume; so that the Gastromycetes, the Hymenomyces, and the Hyphomyces are done, the Ascomycetes have to be done, and the residue will have to await the "ides of March." Fortunately, the groups which will be relegated to an outside place are those which have, somewhat recently, been brought up to date, with the exception of the Sphærospideæ and Melanconiacæ, which latter are somewhat of minor importance.

It is important to bear in mind whenever any attempt is made to institute comparisons of bulk with the *Handbook of British Fungi*, published in

* *Hymenomyces, Gastromycetes, and Heterocœcium*. Imp. Soc. (Amsterdam—Muller, 1892.)

† *British Fungus Flora*, by George Massée, vols. ii. and iii. Soc. (London, 1893. Geo. Bell & Sons.)

1871, that the number of British species has just doubled in the intervening twenty-two years, and that the total of 2810 is augmented to no fewer than 5600. In addition to this, amplification of description was absolutely essential in a great number of species, so that the work should be abreast of the time, and of the greatest possible service to the student.

Little need be said in commendation of these two volumes which has not been said of the first, save the assurance that the performance is fully equal to the original promise. The Hyphomyces, or moulds, which occupy half a volume, are most interesting objects to the microscopist, and the epiphytal species are of importance to the horticulturist. The outline figures, illustrating all the genera, are even more satisfactory than those of the other volumes, so that one cannot help regretting that such simple figures are not available for every species instead of only for a selection. The classification adopted is that of the most recent systematic work, by Professor Saccardo, without any of the topsy-turvyism which was the chief drawback in the Hymenomyces.

After all that can be said about extension of size, these four volumes will scarcely cost more than the publishing price of the two volumes of Cooke's *Handbook*, and considerably less than the market-value of the latter book at the present time. *M. C. C.*

THE COTTAGER'S MANUAL OF POULTRY KEEPING (Published by Horace Cox, Bream's Buildings, E.C.)

THE name of Mr. W. B. Tegetmeier on the cover of this pamphlet is sufficient indication of the excellent and practical nature of the information contained in it. The price (sixpence) brings it within the reach of those for whose benefit it is primarily intended, and it should, therefore do much good work in improving the conditions under which many poultry are now kept, and in suggesting which breeds are the best for small establishments. Speaking of the extra trouble required for the proper management of fowls, the author wisely says that the improvement in the birds will amply repay the care bestowed upon them.

FORESTRY.

THINNING THE TREES.

As "S." says, p. 743, those that sell their timber year after year quickly get to know whether thinning or leaving the trees alone for a number of years pays the best. Especially is it the case with Beech trees, where they have been properly thinned, as some would say, that is, when they have been allowed to grow into shapely trees—with wide-spreading branches and round head; such trees are next to useless for sale as timber trees. Clean-grown Beech will fetch a very good price at the present time, if free from knots. This wood is largely employed by pianoforte-makers; and so it is by brush-makers, even the short, small pieces come in for that purpose.

An important question should be first asked and answered regarding any plantation. What is the primary object in cultivating the timber? Is it intended to bring in the best return irrespective of its appearance when growing, or is the plantation to be managed purely for its appearance? This is the whole sum and substance of the matter. If profit pure and simple is the point of primary importance, then thick planting, and after-growth, too, in the same way must be adopted. Beech trees managed on these lines are here worth 1s. 6d. per foot, when the stems are devoid of branches for at least 30 feet high. Where the branches of the trees sweep the ground, the result of bard thinning to get shapely trees, it is a difficult matter to realise 9d. per foot for the timber. Note the difference, too, between the amount of timber contained in a tree, say seventy years old, as compared with one the same age that has been managed on the ornamental aspect of the question. The latter will supply more bush or faggot-wood, but what of that,

as compared with the value of the opposite-grown tree for timber? It is the same with Fir of sorts, planted thickly together—say, 4 feet by 3 feet apart—and thinned judiciously (not too much), so that the lower branches commence to die when the trees are twelve years old. When plantations of Larch, for instance, are managed on these lines, they much more quickly turn into money than where the side branches are allowed to develop to a great length. Half-a-dozen years since the first cutting of Larch came in for Hop-poles; but now the price of these has fallen, and it is hardly worth the labour to cut for sale for this purpose.

In these parts, where a quantity of Hops are grown too, it is difficult to obtain more than 9s. per hundred. With the cutting, trimming, and cartage, there is not much left for the owner. From 10 feet

purpose of their producing timber of the best quality. See the enormous difference, too, in the number of trees that can be grown on a similar piece of ground as compared with those required for ornament only.

Austrian Pine and Scotch Fir are of little use as timber-producers if too much space is allowed them for the spread of the lower branches. The main stems quickly get "dumpy" in the former variety, and of course the value as a timber tree is *nil*. To make either of these Firs pay their way, they must be so managed that one will "draw the other up," owing to a restricted space only being allowed them. In consequence of a want of light, the lower branches quickly begin to die. The main stems are not only cleaner, but not nearly so crooked, as when more space is granted them.

FIG. 119.—LYCASTE IMSCHOOTIANA.

to 14 feet are the sizes mostly in request for Hop-poles. By allowing the trees to stand a few years longer there is less difficulty in finding a market for the trees at £2 per hundred, to be used as rails for fencing purposes. Much damage does happen at times to plantations of Larch for instance, that are injudiciously thinned after arriving at, say, twenty-five years old.

Within a mile of where I write a good number of Larch have suffered from the recent gales, owing to their being wrongly thinned during the last winter. It is a mistake to make them too thin on the south-western side, as was done in this very instance. Four miles from here is growing some of the finest timber in one wood that I have ever seen. Larch, Scotch Spruce, and Silver Firs have run up nearly 100 feet high; 60 feet of this length is devoid of branches, the stems as clean and as straight as possible. Ash, Beech, and Poplar are almost as high. In many instances there is but a few feet separating the stem of one tree from its neighbour. This is an example of managing trees for the express

There is no reason why Fir plantations should not be managed so as to give double results, viz. appearance and profit also. For instance, more space can be allowed for the outside rows of trees; those inside can be retained thicker. *E. M., South Ham's.*

LYCASTE IMSCHOOTIANA.

This plant, of which a figure is given above is one of two new Lycastes shown by Messrs. Linden, l'Horticulture Internationale, Brussels, at the meeting of the Royal Horticultural Society on Tuesday, the 12th inst. The plant has the habit of *L. Skinneri*, and the flowers equal in size those of that species.

For a description of the flower, we refer our readers to p. 756 of our issue for December 16. It was raised by Mr. Alf. van Imschoot, of Ghent, who gives the parentage as *Lycaeste Skinneri* × *Maxillaria nigrescens*, but the appearance of the flowers is suggestive of *L. Skinneri* × *L. cruenta*.

WEST INDIES.

ROSES IN THE TROPICS.

NOTICING in your issue of October 1, a letter from Mr. Edward F. im Thurn, saying that he had never found any red Roses do well in British Guiana, I beg to forward the following notes of the Roses under my charge here at the Hope Botanic Gardens, Kingston, Jamaica. I have been in charge of these gardens only a little over a year, although I have been in the department of Public Gardens and Plantations, Jamaica, over four years, having previously served four years at Kew. The following notes are entirely the result of my own observations, assisted by my foreman, a most intelligent and observant man, who has been here upwards of six years.

Hope Gardens are situated 6 miles from the sea (Kingston), at the foot of the Port Royal Mountains, are 650 feet above the sea, have an average temperature of 77° F., and an average rainfall of 50 inches, fairly sheltered from winds.

The following is a list of our best red Roses, or rather a list of the red Roses which thrive the best with us:—

1. *Maréchal Soult*, H.P.—Always in flower, a good strong grower, stands drought well, produces good shaped flowers, not so large as the next two on this list, but of good form and substance, retaining its full perfume; is easily propagated, and stands cutting well.
2. *Madame Charles Wood*.—A better exhibition Rose than the former, larger, of good form, not quite so dark in colour, has good perfume, and produces only about one flower where *Maréchal Soult* produces a dozen. It is not quite so vigorous in growth, nor so easily propagated, and must be very carefully pruned.
3. *King of Spain*.—A grand Rose, the largest and best red Rose I have seen; very full of petals, with a delicious perfume, a very vigorous grower—not easily propagated, however, and flowers at about the same rate as *Madame Charles Wood*.
4. *The Meteor*.—A gem of a Rose, sweet, and of a very beautiful carmine-rose colour, but not a strong grower, nor is it easily propagated, and is rather liable to be injured by drought; it is, however, very free flowering, and the blooms are very nice for button-holes, &c.
5. *Princesse Camille de Rohan*.—No praise is needed for this old favourite. The only drawback is, that it does not like being cut, nor does it strike easily; it does not start to flower until the plants are about eighteen months old, after which, however, it flowers freely.
6. A Rose called *Laby-doyen* [*Labe-doyère* H.P.] is one eminently suited to the tropics, as it is found here, being a vigorous grower, yet not making very long growths, the average length of growths being about 5 feet, with nice dark green leaves, producing its flowers in large clusters, often having three to five expanded blooms on a bunch at one time. It has a good perfume, is very easily cultivated in pots, or grown in the open ground, and is a constant flowerer from beginning to end of the year.
7. *Secrétaire Nicolas*.—A good Rose, fairly free-flowering; fairly good grower, not easy to propagate, and does not like being cut, but is, nevertheless, a good dark-coloured Rose.

Rose-coloured Roses:—

1. *Mlle. Thélie Lovet*.—Rosy pink, large and full of fine form, very vigorous, and is best treated as a climber, when it will produce its lovely flowers in abundance. It is one of our very best Roses for producing cut-blooms, is very easily propagated, and may be cut in the most barbarous manner with-

out any apparent evil results; plants grown from cuttings put in last February, have made growths 15 feet long.

2. Madame Moreau is a good grower, easily propagated, produces plenty of flowers, but does not like drought.
3. Madame Issac Pereire, about the same as 2, but stands drought better.
4. Madame Alice Dureau produces nice buds of a pretty rose colour; it is not good for exhibition purposes, but very nice when half expanded, has a nice perfume, is a fairly good grower, and is easily propagated.

Reine du Midi and Paul Neyron are rose-coloured Roses, with good constitution, and well worth growing.

Group No. 3.—All the Roses in this group are free-flowering, of A1 quality, and should be grown by every lover of good Roses, and must be grown by every exhibitor.

1. Victor Verdier.—This Rose here with me is second to none, as it is a good vigorous grower, does not care a fig for drought, not dry winds, nor anything else, in fact, except hard pruning. A plant, or rather several plants, struck in February, have now several of their lovely rosy-carmine flowers on each, every flower being large and perfect in form, and what is to me, at any rate, their peculiar charm, the rich dark green foliage is well up around every flower, so that every flower is a perfect bouquet in itself, and it always retains its exquisite scent.
2. Next comes Captain Christy, a Rose particularly happy in the tropics, if only the knife is kept away from it.
3. Mdlle. Marguerite D'Ombrain, a Rose which, despite being saddled with such a long name, thrives exceedingly well, producing several medium blooms, and occasionally one as large as a Paul Neyron, perfect in shape, and with a most delicious perfume, producing a few of the grandest Roses of the very first quality, to a quantity of medium-sized ones, not up to exhibition standard.
4. Baroness Rothschild.
5. Mabel Morrison.
6. La France.
7. Miss May Paul.

Of the four latter no special mention need be made. They are all lovely. Miss May Paul is best treated as a climber. *Wm. Cradwick, Superintendent, Hope Botanic Gardens, Kingston, Jamaica.*

(To be continued.)

FLORISTS' FLOWERS.

SELECT DECORATIVE CHRYSANTHEMUMS (JAPANESE).

I CONSIDER that for general utility and excellence the following cannot, on the whole, be surpassed. The list includes thirty varieties for large flowers and decorative uses as well, without direct reference to exhibition blooms. Avalanche, as a dwarf grower, with pure white flowers; Elaine, as a white for cutting purposes; Florence Davis, a beautiful white, quite distinct, the pale green centre adding to its attractiveness; Madame Th  se Rey, which may be well described as a white Val d'Andorre, with a pale lemon-coloured centre (this is the finest new white of the season); Colonel W. B. Smith, a light terra-cotta colour of large size, the flowers lasting well, quite distinct from any other variety; Mrs. Falconer Jameson, bronzy-orange, pale yellow reverse, very effective, and a favourite colour; G. C. Schwabe, rosy-carmine, with long recurved florets; Excelsior, cerise-rose, silvery reverse, a grand variety; Sunflower, still unsurpassed for its beauty and general attractiveness: the long drooping petals enhance its value; W. H. Lincoln, a large incurved yellow, somewhat early, but the flowers last well; Lord

Brooke, very distinct, large, bold flowers, decidedly incurved, bronzy-yellow in gradations of shades; Mdlle. Marie Hoste, with a slight tinge of pink in its otherwise white flowers, a fitting companion to Madame Th  se Rey; Vivian Morel, pale mauve, with a silky shading, one of the best, and so distinct in its character; Thunberg, or Mr. H. Cannell, the former being the taller, with the richest colour, but the latter having the finer flowers and better habit, the rich yellow shade, and the long incurved florets, make either kind desirable; Edwin Molyneux, decidedly valuable, and quite distinct, its colour being so well-known (when not severely dis-budded the flowers are, I think, even prettier than when of large size); Etoile de Lyon which has, I think, improved in quality this season, it has certainly not been so coarse, the deeper colour or purplish-rose is, I think, its best shade; Val d'Andorre, it will take a long time to surpass this variety for general utility, the deep orange-red shade makes it quite distinct also, whilst, as a specimen, it is one of the best; Mrs. E. W. Clarke, extra large, deep shade of amaranth, lighter reverse, a distinct colour; Sarah Owen, golden bronze, shaded with rose; Stanstead White should be included for its large, pure white flowers, which stand well; Wm. Seward is one of the richest of all the deep-crimson colours, it was better earlier this season than later on; Mr. Wm. Holmes, a valuable variety for cutting, chestnut-red, tipped gold; Source d'Or, orange and gold, unsurpassed for cutting; Lady Selborne has this same essential value, being early also and very free; Mdlle. Lacroix also makes a useful variety for a large supply of cut bloom, and is one that may be worked in for December uses; Margot, a pale rosy-salmon, is also very free and rather early; Roseum Superbum, a lovely shade of colour, deep Rose, tinted with lilac, one that lasts well; Madame Bertier Reudatler, reddish-orange, shaded with yellow, distinct and free, makes a good specimen; Mr. Garner, yellow, tinted bronze, free; and Golden Gem, bronzy-crimson, fading to pale yellow, valuable as a late variety. Dwarf growth has been borne in mind as far as possible, only a few exceptions thereto having been made. Other growers may discard a few of this list, but I fancy on the whole, there is not much fault to be found with it. *H.*

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

By T. TURTON, Gardener, Maiden Wregh, Reading.

TOP DRESSING FRUIT-TREE BORDERS.—As soon as the various operations of pruning, nailing, and the necessary dressing of fruit trees on walls are finished, the top-dressing of the borders should be proceeded with, if the weather is then suitable for this kind of work. There can be no rule for this matter, as it will depend on the purposes to which the borders are put, whether reserved for the roots of the trees, or, as is more usual, cropped with vegetables, Strawberries, &c. Taking the Pear border—it would be loss of good compost to put it on the surface with the idea of benefiting the trees, as if successful in attracting the roots to the surface, these would be cut off when digging for some crop that is taken from the border. I have explained in former Calendars how the roots in such borders are assisted with new soil in these gardens, viz., by placing it at such a depth that it will not be disturbed when the border is merely dug one spit deep. After cleaning off weeds, &c., prick up the surface of an uncropped border with a digging-fork for a width of 4 feet from the wall, and then afford a nice dressing of charred garden refuse and old mortar, which will keep the soil open for the reception of water in the summer.

WALNUTS—If the trees are standing near to quarters of vegetables, the roots may need to be somewhat severely pruned every two or three years, the operation being carried out by opening a trench all round the tree at a point about equal to the stretch of the branches, going down as far as roots are found. This work should no longer be deferred, providing the weather keeps open, as if deferred far into the new year, any large roots which it may be necessary to cut, not having time to callus over before the sap

is excited by any temporary increase in the temperature, bleeding will be sure to take place, with a result that the tree will be weakened. As a matter of convenience, the Walnut-trees should be planted in the park or paddock, and not in the kitchen-garden. The P  coce Walnut, an early-bearing variety, should always be planted, as well as the best of the commoner kinds. If Walnuts are planted with the idea of utilising the wood, plant those with small thick-shelled nuts—never the finer nuts. Be sure that whatever is planted it is of the best. The very large fruiting sort, known in the South as the French variety, is excellent in good seasons, and it ripened perfectly the past season. But I cannot recommend it for planting in the North. Trees will grow well if stations are prepared for them, not less than 8 feet in diameter and deeply trenched, adding rotted dung if the land is poor, or exchanging part of the natural soil for some turfy loam. The trees, however, would grow much better if the place selected is in a corner of a paddock or park, and kept cultivated for two or three years. The trees in this case would be planted somewhat close together, 24 feet being a suitable distance, with the idea of grubbing the variety P  coce so soon as the larger trees come into bearing and wanted the space. Good Walnuts are such a valuable addition to the dessert in the autumn, that where trees do not already exist steps should be taken to grow them.

THE KITCHEN GARDEN.

By H. C. PRINSEP, Gardener, Burted Park, Uckfield.

EARLY PEAS.—Those sown in the open during November will have appeared above ground, and may need protection of some kind in severe weather. It is seldom that the weather is so mild at such a late date in the year, but a sudden change may take place, and the young Pea plants suffer severely. Peas in warm frames and pits should have all possible light and air admitted when the weather is mild, and keeping the glass clean is therefore very necessary. They do not thrive in a close warmth, but all the same, cold draughts should be avoided, as mildew is often induced thereby. If the Peas are growing in hot-water-pits, the pipes should never be more than lukewarm, or the atmosphere will become too dry for the plants. Another sowing may be made when the former one is somewhat advanced, a constant supply being what is looked for when Peas have once been sent in to the kitchen.

ASPARAGUS.—Roots lifted from this date onwards will start into growth readily in heat, and this fact demands notice, or the quantity of roots may be unduly lessened in number without much corresponding gain in supply. Asparagus forcing at very early dates leads to the destruction of a great many plants, and to keep up the supply of plants, new plantations must be made every spring. For this purpose I have found it a good plan to sow seed on a slight hot bed early in January, so that young plants will be ready for transplanting in April; and plants raised in this way start very readily in growth when set out if carefully hardened off before planting, and make much stronger roots than those raised from seed sown in the open ground in April, as they have two months longer time in which to grow.

RADISHES.—These plants need very little forcing, so that if a slight hotbed can be provided, succulent roots will soon form. The seed should be sown thinly, that is, at 1 inch apart, and when the plants appear, all the light and air possible should be admitted to them. There are now so many early varieties, that it is almost unnecessary to name any, but the olive-shaped Radish usually turns in the quickest. On light dry soils in sheltered positions, and where protection can be afforded, a sowing may be made in the open. To protect the seed till it germinates, cover it with straw-mats, straw, or other similar material that can be easily removed. It is useless to sow so early as this on cold wet soils, the seed usually perishing before germination can take place.

MUSHROOM-HOUSE.—Continue to prepare material for new beds, and when it is necessary to clear out old ones, or get in manure for making fresh, do so if possible on warm days, so that there may be no material lowering of the warmth of the house. The soil needed for covering the beds should be made warm and drier before being placed on the manure.

FRENCH BEANS.—Where these are grown in pots and it is desirable to retard them, they may be re-

moved to a cool, dry house; but the pods should not come into contact with damp, or rotting will begin. The plants must not be crowded together, as nothing can be gained by it, which in most gardens will not be necessary with forcing-houses at work.

FRUITS UNDER GLASS.

By M. TEMPLE, Gardener, Carron House, Falkirk, N.B.

VINES—The changeable weather and temperature have rendered the keeping of Grapes more difficult. Fire-heat, though always to be avoided as much as possible, is requisite in damp weather, to expel excess of moisture; with a little air on at the top of the house, and the pipes made just warm, this is easily effected, and without harm. The temperature should not fall below 45°, unless the weather is severe; and until the leaves have all fallen, daily attention must not be withheld. The season is now at hand when those that are still hanging should be put into bottles of water. If a good quantity of Lady Downes' Seedling is grown, the supply will be prolonged, as that fine Grape, when well and properly ripened by the end of September, seldom loses berries by decay or shrivelling, and if light is excluded, bloom and colour remain to the last. These Grapes can be kept till May, and this renders early forcing of less consequence. We use Gros Colmar from December to late in February; Alicante next, and then Lady Downes, the temperature of the room where they hang averaging 45° to 50° during the winter months. No current of air should pass over the Grapes, but there must be ample provision to allow the escape of moisture; fire-heat should only be used when absolutely necessary. Use clean bottles, clean water, and a little charcoal to keep the water sweet. I cut the wood with bunch attached about 9 inches long, and shorten beyond the bunch to half an inch. When the bunches are in position, they hang clear of the bottles, and a piece of wadding is fastened in with the wood, to keep it in place, and to prevent the escape of moisture.

PEACHES AND NECTARINES.—In the early house now started allow no fluctuation of temperature except by sunheat, when 10° rise may always be allowed with air on, but 45° to 50° at night need not be exceeded till the buds are opening, at which time we find a temperature of 55° during the day, with 50° at night (and lower when weather is severe), quite sufficient until the flowers are set; and we never have suffered from bud-dropping. Syringe at least twice daily till the flowers open, except when the weather is damp. If the roots are outside, and in much colder ground than other roots under glass, it is very conducive to bud-dropping. Protection with litter or bracken should be given. Drenchings of cold water at the roots are as likely to cause bud-dropping, as is excessive dryness. Fumigate the houses at least twice before the buds open.

STRAWBERRIES—Strawberries do well with the treatment which Peaches require as to temperature, and on the shelves the first batch will soon be showing signs of moving. They also require fumigations to prevent green-fly from becoming established. The roots must not be allowed to suffer from want of water, and they may be syringed lightly once a day. Let the temperature of the water used for any purpose be rather in excess of that of the structure when used. Plants placed in pits or frames on leaves require little moisture till growth is active. The temperature need not exceed 55° during the day, and 50° at night. A little air put on when weather permits is always advantageous. Prepare a succession of plants, by making the drainage perfect, taking out worms and re-surfacing the soil, after removing carefully that which has become inert or sodden. Leaves which are green and healthy should remain on the plants.

THE FLOWER GARDEN.

By T. H. CRASP.

ALTERATIONS AND IMPROVEMENTS.—During the past week little could have been done as regards the regular work in this department, but the making new flower-beds, walks, and shrubberies, the renovation of exhausted beds and borders, can now be carried out as far as the weather will permit. The baskets and vases which are filled in the summer with plants should be emptied of the soil so as to prevent injury from frost. Fuchsias, Chrysanthemums, and other half-hardy plants now cut down by frosts, should have a thick mulch of partly-rotted manure, finely sifted coal-ashes, or similar material. Holes

may be dug out for choice shrubs and trees, and if necessary, some of the staple may be replaced with fresh soil suitable for the plants. In the same manner, trees and shrubs which are not growing satisfactorily may be improved in vigour. Beds of autumn-sown annuals may be protected against frost and bright sunshine by having evergreen twigs stuck in the soil amongst them. The soil about the roots of climbing Roses should be examined, and if it should appear to be exhausted, it should be dug out round about the roots, and three or four barrow-loads of good soil placed about them, treading it in firmly. The soil may consist chiefly of sound turfy loam, with an eighth of the whole in rotten farmyard manure or leaf-mould.

FRAMES—Calceolarias, Pansies, and similar plants, in these shelters, will need full ventilation in mild weather. Decaying foliage should be picked off, and the surface of the soil stirred occasionally.

BEDDING PLANTS in warm-houses should have as much space allowed as possible, and full light, otherwise growth will be too rapid, and they will be very liable to be attacked by mildew and insects; the best place for them is a shelf near to the glass. Pelargoniums are an exception, for if room is limited, they may be stood in any out-of-the-way place, provided it is not reached by frost, and is provided with a fair amount of light, and the plants kept rather dry. This is a trying period of the year for all tender plants, such as *Colus*, *Alternanthera*, *Iresine*, &c., and the only sure way of keeping them in health is to afford them warmth of 58° to 60° by night, and a little more by day.

THE ORCHID HOUSES.

By W. HOLMES, Gardener, Pickering Lodge, Tunperley.

HINTS ON CURRENT OPERATIONS—In the East-India house, the greater part of the *Aérides*, *Vandas*, *Saccolabiums*, will at this season be resting, and the tips of the aerial roots, which when growing are green, will have put on a whitish coating, indicating the period of rest. From this time until the roots of these plants recommence growing, the materials in which they are potted ought to be kept dryish, and the air of the house much drier than at other seasons. The flowering of these species in the spring will depend greatly on the kind of treatment afforded during the next six weeks; at the present time, the East-India-house temperature may descend on nights which are frosty to 55° without doing the plants any harm whatever. This house may be made to look gay with the later-flowering *Vanda Amesiana*—a grand species that is flowering here, and one that will remain in fine condition into the new year. It has very fragrant flowers. With these plants are arranged *Calanthe Veitchii*, of a good dark type of flower, *C. vestita rubra*, *C. v. lutea*, and various *Cypripediums*, make a pretty display for so dull a season of the year. *Vanda cerulea* I find to do well when placed at the cooler part of this house, hung close up to the roof in baskets or cylinders of teak. In these receptacles the roots run about on the outside. It is a rather difficult plant to keep in fine condition for any length of time, and a change at different seasons of the year into an intermediate-house, such as that of the *Cattleyas*, seems to put new life into the plant. It is a notion which I have that this species does not do well because growers will not always cut off the flowers after a reasonable time, but let them remain on the plants for too long a period. If we were merely satisfied to see all of the flowers open and then take the spike, we should see many more robust plants than we do. Orchid growers and gardeners will have noticed the shrinking of the leaves of *Vandas* after blooming, and many of these are lost. This, I take it, is caused by an excess of flowering. I took much notice in the summer of this year of a very healthy plant of *V. Denisoniana*, which bore two flower-spikes; when these were cut off the leaves began to shrivel, and it was some time before the leaves again plumped up. This is true also of *V. anavis* and *V. tricolor*. In the East-India-house *Cypripediums* and *Selenipediums* find a suitable home, and as these plants make their growth during the winter, watering will require careful attention, and any excess of moisture about the plants on the stages must be avoided. During the last few years some fine additions have been made by way of garden hybrids of *Cypripedium*, the best of which are from *C. insignis* and *C. Spicerianum*, which have the merit of being very free-flowering and good growers.

These may be grown in houses having a variety of temperatures, and the flowering season thus prolonged. Of the garden hybrids which flower at this season none surpass *C. Leeanorum superbum*, *C. L. giganteum*, and *C. L. Masereelianum*. Other useful varieties are *C. Swinburnei*, *C. Arthurianum*, *C. Bartetii*, *C. ænanthum*, and all these are of the *C. insignis* strain. *Dendrobium Cambridgeanum*, *D. chrysanthum*, if re-commencing to grow, must be encouraged with a few degrees more warmth, and just a little more moisture at the root.

PLANTS UNDER GLASS.

By BAILEY WADDS, Gardener, Birdsall Gardens, York.

ORNAMENTAL FOLIAGE PLANTS.—Considerable care will be required during these dark days to keep the decorative varieties of Palms that are moved about for house decoration in good health. Large plants are often required in small vases and the roots are cramped into small pots for that purpose. During the time they are standing in cold rooms or houses, keep them rather dry at the roots, or the foliage soon turns yellow. When this occurs, remove them as soon as possible to a warm-house, and let them stand for a time and become dry, then give a good supply of manure-water, or place the pot for five minutes in manure-water of the same temperature as the house they are in. *Kentias* are the best Palms for winter decoration; they will stand more ill-treatment than other kinds, and are the quickest to recover when brought into heat. *Scaevola elegans* is a very graceful Palm, but is soon injured, and does not recover like the *Kentias*. A pinch of good inodorous artificial manure sprinkled on the soil is very beneficial during the winter months to plants of this description. Where the pots are full of roots, it will help to keep the foliage a good colour, and there is no need to water it all in at once. *Cordylina indivia* and *C. australis* should be grown in various sizes, from seedling plants in 60-sized pots to plants 10 feet high; small plants are very elegant for table decoration, and the larger size for vases and grouping. Cycads and *Baucarneas* will require careful attention at this season; and if these or any other plants are affected with white or brown-scale, they should be thoroughly cleaned with insecticide. White-scale is the worst enemy to the plants, which should be placed on their sides, well syringed, and the foliage rubbed with the fingers or a sponge, brushing the stems with a stiff painter's brush. *Ficus elastica*, the India-rubber plant, is a very good window plant for the winter months, and if it is not over-watered, will last in good condition longer than most plants. For giving a tropical appearance to a conservatory or group of plants, there is nothing to beat *Musa ensata* with its bright green leaves and red midrib. It will stand in good condition for a long time in a cool house, and is very valuable for church decoration; *Musa Cavendishii* grows and fruits well in a large pot in heat, and pairs of them are very attractive on festive occasions. *Araucaria excelsa* is one of the best plants for church decoration at Christmas, placed in pairs in the nave or chancel. If *Araucarias* are scarce, good Spruce trees are likewise useful; and for a large church, good well-shaped Spruce, 12 or 15 feet high, cut out of the wood, trimmed up to the good branches, and spliced on to Larch or Spruce poles, to make them high enough to be out of the way of the heads of passers-by, and placed in pairs at a good distance apart from belfry to chancel, make a grand effect. Small plants of Spruce and *Cupressus Lawsoniana* in 6-inch pots are very useful for Christmas work; also *Euonymus europæus*, and *Aralia Sieboldi*, which in large or small pots still holds its own when well looked after. Very striking plants for standing in pairs are *Phormium tenax*, *P. variegatum*, and *P. Veitchii*—they stand well in a cool place.

CHRYSANTHEMUMS, as they finish flowering, should be cut down, and those required for supplying cuttings removed to a spare house. The best arrangement possible should now be made of those plants that will keep in flower during Christmas. Peter the Great, Ethel and Julia Lagravère are extra good this season, and are now at their best. Give as much air as possible night and day, with a little fire heat at times to dry up any damp. In advising leaving air on at night, one might say, beware of storms, and make all the ventilators secure. The storms the past three Fridays have been fearful. Frames or hand-lights should now be prepared in a lateinery for striking Chrysanthemum cuttings as soon as they can be obtained.

EDITORIAL NOTICES.

Letters for Publication.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for contributions, or to return unused communications, or illustrations, unless by special arrangement.

Plants, Fruits, &c., to be Named.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should be sent to the PUBLISHER.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—37.9.

The World's Horticultural Society. WE have been requested to give publicity to the following notification addressed *urbi et orbi*, and as it seems catholic, comprehensive, and cosmopolitan, it is not inappropriate at the Christmas season!

"To the Horticulturists of the World, Greeting.

THE WORLD'S HORTICULTURAL SOCIETY.

Immediately following the World's Congress on Horticulture at Chicago in August last, a series of meetings was held to consider the advisability of organising a horticultural society which shall include every country of the globe. After much discussion, in which many eminent men from various parts of the world engaged, the World's Horticultural Society was organised, and the election of the three general officers was held, on August 25. This new society is designed, in the language of the constitution, "to promote correspondence, and to facilitate exchange of plants and information between the countries of the world." This society can co-ordinate and extend the work of all existing societies, compile statistics, promote legislation and education, prepare correspondence directories, diffuse all the latest information from the various parts of the globe, consider means of transportation, and facilitate the exchange of varieties and every commodity in which pomologists, viticulturists, florists, vegetable gardeners, and other horticulturists are interested. The society will probably meet occasionally at the various international exhibitions, upon which occasions, also, it can greatly aid in procuring exhibits from all parts of the world.

The general charge of this great Society resides in three officers: the President, Vice-President at large, Secretary-Treasurer at large. There is to be a Vice-President and a Secretary-Treasurer for each country, who shall direct the affairs of the Society in their respective countries. The officers elected at Chicago on August 25, 1893, were:—PROSPER J. BERCKMANS, A.M., Augusta, Georgia, U.S.A., President: a native of Belgium, but for many years a prominent pomologist and nurseryman of the United States, where he is now President of the American Pomological Society; HENRI L. DE VILMORIN, Paris,

France, Vice-President: a distinguished horticulturist, scientist and author, who is favourably known throughout the world; GEORGE NICHOLSON, Secretary-Treasurer, Curator of the Royal Gardens, Kew, England: everywhere known as the author of the incomparable *Illustrated Dictionary of Gardening*. Later, the President appointed WILLIAM F. DREER, of Philadelphia, Vice-President for the United States: a man long and favourably known in the seed trade; and Mr. DREER appointed Professor L. H. BAILEY, Cornell University, Ithaca, N.Y., Secretary-Treasurer for the United States. At this juncture, Mr. NICHOLSON declined the office of Secretary-Treasurer at large, as it would be inconsistent with his present duties. This is a source of great regret to his many friends and admirers. Until a successor is elected, the Secretary-Treasurer for the United States has consented to act in the capacity of general Secretary-Treasurer.

The Society now requests the earnest and early support of its friends. The Vice-Presidents of the various countries will be announced soon, and the organisation will then be quickly completed. The Society needs the co-operation of every enlightened horticulturist and every important horticultural organisation.

PROSPER J. BERCKMANS, PRESIDENT,
Augusta, Georgia, U.S.A.

HENRI L. DE VILMORIN, VICE-PRESIDENT,
No. 22, Avenue de la Bourbonnais,
Paris, France.

L. H. BAILEY, Ithaca, N.Y., U.S.A.,
SECRETARY-TREASURER for the United
States, and TEMPORARY SECRETARY-
TREASURER AT LARGE

CONSTITUTION OF THE WORLD'S HORTICULTURAL SOCIETY.

This body shall be known as the World's Horticultural Society.

The object of this Society shall be to promote correspondence, and to facilitate exchange of plants and information between the countries of the world.

The membership of this Society shall be composed of societies in the various countries and of individuals, who shall subscribe to its constitution, and pay the membership fees.

The officers of this Society shall consist of a President, First Vice-President, and a Secretary-Treasurer; also a Vice-President and a Secretary-Treasurer in each country, independent state, or province, whenever suitable persons can be found who are willing to undertake the duties of such office. The officers shall constitute an Executive Committee, which may call meetings on such occasions of interest as may be deemed worthy.

The term of office of all officers of this Society shall be three years, and until their successors are duly elected and qualified.

The Vice-President in each country shall be appointed, at the outset, by the President of the World's Horticultural Society, after conference with the foreign representatives at the World's Columbian Exposition, or upon correspondence with horticulturists in the various countries.

The Vice-President of each country shall appoint the Secretary-Treasurer for that country.

The fee for societies shall be 5 dols. annually, or as near that amount as the currency of the country readily admits. The initial fee for individuals shall be two dols., or approximately that amount, which fee shall also be the dues for the remainder of the current calendar year. The annual dues thereafter shall be one-half that sum.

The funds shall be spent by the Executive Committee for the necessary expenses of the Society, which shall allow one-third of all the collections in each country to be retained there for its own expenses and to be disbursed by its own Secretary, except in the country represented by the President, where all the funds collected shall be retained, but that country shall pay its share of the general expenses. The Executive Committee has power to publish a periodical of the size and frequency of issue war-

ranted by the funds, and which shall be sent free to all members of the Society. In the absence of meetings of the Executive Committee, the President, First Vice-President, Secretary-Treasurer, and the Secretary-Treasurer of the country represented by the President, shall constitute a Finance Committee, which shall audit the accounts of the Society, any two of whom shall constitute a quorum.

The President, First Vice-President, Secretary-Treasurer, and Secretary-Treasurer of the country represented by the President, constitute the Committee on By-Laws of the World's Horticultural Society, any two of whom shall constitute a quorum.

Adopted by a meeting of horticulturists of various countries, in Chicago, Aug. 25, 1893."

OUR ALMANACK.—Secretaries of Societies and others, are earnestly requested to forward immediately, the dates of Show Exhibitions and Meetings of Botanical and Horticultural Societies of any kind for 1894, for insertion in the Almanack, to be published in our issue for January 6.

FLOWERS AND FRUIT FOR CHRISTMAS.—

The present season has certainly offered more than usual facilities to the caterer for the flower, fruit, and vegetable market. The closing months of the year, if they have witnessed on occasions violent storms and excessive cold, have, nevertheless been fairly free from hard weather, necessitating unusual firing. In and about London, moreover, they have been almost entirely free from our common enemy "fog," and this fact in itself would prevent us from thinking the season other than kind. Under these circumstances it is not surprising that the supply of flowers at Covent Garden Market is quite equal to what we are accustomed to see at this time—and we may assure our country readers that means a great deal. The amount of produce that goes through this market during what is termed the Christmas season, is prodigious. Take for instance the trade in Evergreens; the letter published in these columns last week respecting the number cut for Christmas-trees, and passing through one firm, would surprise many; but at Covent Garden again the same thing is going on in same proportions. For forming the large specimens some 10 feet high or more, the common *Picea excelsa* is generally used. It is the most convenient for hanging articles upon, and very much better than the top of a Yew tree. Where all these large ones are required can only be imagined, but one thing appears certain, that Christmas-trees to-day are as popular as they ever have been. Laurel and miscellaneous evergreens for ordinary decoration are also plentiful, and the Holly—at any rate most of that which is sent here—is well-berried. Mistletoe in the greater quantity comes from abroad, packed in light crates, and is unusually well-berried. In regard to the flowers, abundance may be seen of Chrysanthemums, Roses, Azaleas, Callas, Tulips, Hyacinths, Violets, Lilies of the Valley, White Lilac presumably from France, Tuberoses, Lapagerias, Camellias, *Lilium Harrisii*, Mignonette, Orchids, &c. Many choice forced flowers will be noticed amongst the foregoing, and no doubt they have been produced without the usual amount of hard firing. White flowers very greatly predominate, no doubt an index as to which are most appreciated. Amongst fruits, Apples and Pears always hold prominent places. Apples may be had in any quantity, especially foreign productions. American Apples are still much in favour with the London house-keeper, who is easily misled by colour and size. And we hear of good English Apples being put into American cases in order to the better effect their sale. Still, English fruit fetches good prices. Ribstones are never retailed below 3d. per lb., and very inferior Blenheim Pippins we see marked 4d. per lb. On the other hand Newtown Pippins may be seen offered for sale at 2d. each. Pears of the best qualities are rather dear, and are chiefly continental consignments. English Grapes can be had good at 2s. to 2s. 6d. per lb., but the choicest are 3s. 6d. or even more. Oranges are just

HILLINGTON HALL, THE SEAT OF SIR W. FOLKES, BART.

beginning to take their usual place, but as yet not much ripe fruit has made its appearance, although some fine samples of Floridas, Jaffas, and Canary Islands' Oranges may be seen in the shops; also Montserrat Lemons, and Mandarines. Indifferent-looking Melons are marked 1s. 6d. We noticed two punnets of Strawberries in one shop, but they looked far from tempting, though without doubt, a high price would be asked at this season. Amongst tropical or less popular fruits included at some of the stalls are Pomeloes, a name under which some of the smaller species of Shaddocks are sold, and Custard Apples the produce of *Anona reticulata*.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—On the occasion of the annual meeting of this Society being held next year at Cambridge, on Monday, June 25, and four following days, exhibits of cider, perry (by makers and growers), jams, and preserved fruits—all of 1893 growth, are solicited, substantial prizes being offered. The district comprises the counties of Bedford, Buckingham, Cambridge, Essex, Hertford, Huntingdon, Leicestershire, Middlesex, Norfolk, Oxford, and Suffolk.

"THE KEW INDEX"—We have already announced the publication of the second instalment of this colossal undertaking, and but few additional words are now requisite, seeing that it is not long since we had occasion to comment on the plan of the work and the method followed in its compilation. The present part begins with *Dendrobium exculptum* and ends with *Justicia Zollingeriana*, thus completing the first volume of 1268 pages. To illustrate the enormous extent of the work and the labour connected with it, we may say that *Hieracium* occupies no fewer than thirty-three columns, *Erica* and *Eugenia* each take up twenty-three, *Euphorbia* thirty, *Ipomoea* seventeen, *Epidendrum* nearly twenty, &c. Indeed, if we may judge from almost daily use of the previously published fascicle, there is more reason to question the liberality of the compilers than their reticence. The mere incidental mention of a name introduced by an author by way of illustration in a paper not of a descriptive nature, does not in our opinion warrant the insertion of that name either as a synonym or as an adopted name in any systematic list or book. It is a mere *nomen nudum*, and its insertion sins, in spirit if not in letter, against the law that forbids us from attributing to an author that which he did not say. Nor would it be an answer to say that authors should not coin *nomina nuda*, because that depends upon the use that is to be made of the name. The attachment of the name of a botanist to "*Diervilla rosea*" is, we submit, unfair to the writer—and against the practice of the authors of the *Genera Plantarum* in analogous cases. Eucephalartos "*Acanths*," Mast., is cited as a good species, but it was referred to E. *Friderici Guelelmi* = E. *cyadifolius* in the *Gardeners' Chronicle* by Mr. DYER in 1879, Jan. 4, p. 11. The very frequent reference to the pages of this book which we are constrained to make convinces us more and more of its extreme value, and enhances our admiration of the patience and judgment of the authors. The book is absolutely indispensable to any botanical reference library.

SHELTER FOR FLOWER-GIRLS.—A lady writes to the *Westminster Gazette* to suggest that shelters of the same kind as are provided for cabmen should be provided for flower-girls. In the good time coming, when London ceases to be "a squalid village," and is transformed into the "Place Beautiful," the authorities may go further than the lady who writes to our contemporary suggests. In that—the London of the future—the main thoroughfares are (at least, so say some of the prophets of the beautiful) to be dotted with *al fresco* flower markets, which shall give to our great arteries of traffic a greater measure of sweetness and light than they at present lend to life. Meanwhile, there is no reason why some enterprising firm of horticulturists should not adopt the suggestion of the *Westminster Gazette's* correspondent, and by presenting a flower-girls' shelter to the metropolis, see whether it is that sort of thing the women want

or would use. We are not, however, too sanguine as to the amount of appreciation with which it would meet, and should hardly care to be in charge of it. The average flower-girl of this generation has too many of the characteristics of the nomad to encourage us to believe that the suggested shelters would meet her views.

HORTICULTURAL CLUB.—The usual monthly dinner and *conversatione* took place in the rooms of the club at the Hotel Windsor on Tuesday last. There was a good attendance of members, including Messrs. T. W. Girdlestone, Selve Leonard, Harry Turner, Charles E. Shee, J. Herbert Veitch, J. Carrington-Lee, George Bunyard, and the Secretary. Mr. Selve Leonard gave a very interesting account of his excursion to the Pyrenees during the past summer, describing the habitats of many of the peculiarly Pyrenean plants such as *Ramondia pyrenaica*, *Saxifraga longifolia*, and showed how peculiarly local they were even in the Pyrenees. M. HENRI DE VILMORIN supplemented this account with the description of his own experience in the same localities, and showed how in some of the valleys contiguous to the places visited by Mr. LEONARD, plants which he had been unable to discover would be found in abundance; several valuable hints were given by other members as to methods of cultivation, and the whole subject opened out a most interesting matter for discussion, in which nearly all those present joined. A cordial vote of thanks was accorded to Mr. SELVE LEONARD for having so much contributed to the instruction and pleasure of the members.

RAILWAY RATES.—We frequently hear complaints of the disproportionate cost of freight in the case of home-grown fruit or other horticultural product, as compared with that of foreign produce conveyed over the same line of rails. We have no monopoly in this matter, as we learn from *Garden and Forest* that, whilst it costs 50 cents to convey a box of Lemons from Florida to New York, the cost for transportation from Sicily is but 32 cents, to which, however, the Government, by way of making Lemons dear, adds a duty of as much more. From California to New York the railway charges on a similar package are 57½ cents.

ARTIFICIAL COLOURING OF FLOWERS AND FRUIT.—The tinting of flowers naturally white has already been spoken of in these pages, and now we have a little more to tell our readers about the same subject. It seems only natural that so purely fanciful an art should originate among our French neighbours, whose ingenuity is so well known. The *Revue Horticole* tells us a few of the secrets of the production of colour in flowers and fruit, and we mention them here for the benefit of any who may wish to try such a curious experiment for themselves. It is said that to colour flowers through the stalks, it is necessary to put five grammes (1 gramme = 15 grains) of any colouring matter into a vessel which will hold about ten grammes, to bruise the tip of the cut stalk with a light tap with a hammer, and then to put the stalk into the vase for a greater or shorter time, according to the depth of colouring required. Two hours after this contact with the dye, the tinting of the flower is accomplished. On taking the blossom from the vase, it is advisable to cut off the bruised part of the stalk and soak the flower for an hour or two in a vase of clear water. To tint white bulbous plants, fill a vase with fifty grammes of clear water and fifty grammes of colouring matter, stir the mixture up well, then, after slicing the bulb with a pen-knife in one or two places and cutting off the tips of the roots, leave it steeping in the tincture until the flowers begin to colour. Then replace it in the pot, covering it with a little moist earth, and the flowers will finish colouring there. Fruits as well as flowers can be artificially coloured, and sometimes this is done for the purposes of adulteration, as, for instance, when Plums are too green they are coated with acetate of copper and sulphate of copper. When too pale, Lemons are tinted up with citronine and "naphthol-yellow," the green spots being imitated

with "diamond-green." Strawberries are coloured by sprinkling them with "sulfo-fuchsine" or "rhodamine." Peaches receive a beautiful colouring from a mixture of "rhodamine" and "citronine," applied with a brush, using a zinc stencil-plate pierced with holes. In Melons a tube is introduced through which "atropeoline" and "orange azo" with a little essence of Melon is put into the centre. Very pretty varieties of Apples and Pears are contrived by using a little aniline dye. These devices may make bad fruit saleable, but are not examples to be copied, unless for the sake of making a curious experiment.

THE DUCAL GARDENS OF SAXE COBURG GOTHA.—H.R.H. DUKE ALFRED, being an English prince, as well as a German potentate, will doubtless recall with pleasure the fact that the gardens of his palace, which date practically from the period subsequent to Waterloo, owe not a little to the English botanical specimens, which nearly ninety years since were thought necessary to give a then modern air to the gardens of the Duchy. In their midst is a ruin, which is one of the many proofs of the eccentricities to which some princes have been prone. Time's hand can claim no credit for the ruined Castle. It was built for the express purpose of being converted into a ruin, and no sooner had it been completed than it was bombarded by cannon, and so enabled its owner to have a ruin manufactured on the principle of "while you wait." Our authority is not a facetious journal, as we have taken our facts from *Loudon's Encyclopaedia*.

THE WEATHER is not so inconsistent as its detractors hold it to be. It is now not at all unlike it was one hundred years ago. In the *Annual Register* of 1793, we, the other day, came across the following passage:—"The climate of England in the opinion of many has undergone a considerable change. Formerly we used to have smart frosts in winter, and hot and sometimes dry summers. For some years both winter and summer have generally been wet, and there has been so little ice in the winter, that luxury by its agents has been obliged to procure it from foreign parts. In the course of last year (1792), those who kept a register of the weather tell us that there were but one hundred and three dry days. For the time that is passed of the present year (January to February, 1793), we have scarcely had six dry days." How many times, we wonder, since that passage was written, would it have applied to the weather of the many years that have come and gone since 1793? It seems to us that the weather has a limited programme, and is constantly obliged to repeat itself. It must by now be feeling somewhat ashamed of its resourcelessness and sameness.

THE EXPERIMENTS COMMITTEE OF THE KENT COUNTY COUNCIL held a meeting at the Horticultural College, Swanley, on Thursday, December 15, at which the report of the last year was read and approved, after which Mr. PENTLAND SMITH, M.A., B.Sc., gave an account of the "Botany of the Potato Disease," illustrated by numerous diagrams, and went on to speak of the preventives.

TECHNICAL HORTICULTURE.—As a result of the practical teaching on these subjects undertaken in Surrey under the auspices of the County Council, we are pleased to hear that in one case a gardeners' society has been formed. The object of the society is to discuss subjects connected with horticulture, and to keep up the interest engendered by the lectures of Mr. JOHN WRIGHT.

COMPLIMENTARY DINNER TO MR. GEORGE CANNON.—In recognition of Mr. CANNON'S services to the Ealing Horticultural Society as its Secretary, and also as the Vice-Chairman of the Ealing and District Gardeners' Society, this gentleman, who has just embarked in business on his own account at Ealing, was entertained at a complimentary dinner at the Lyric Hall, Ealing, on the 15th inst., the Chairman being Mr. RICHARD DEAN. In replying to the toast of his health, Mr. CANNON stated he was the son of a gardener, and while fresh from school he went into the nursery of Messrs. OSNOAN

& SON, at Fulham, where he came under the tuition of Mr. PITMAN, who served the firm as fruit-tree cultivator for something like sixty years. He went thence into the service of Mr. ALEXANDER DANCER, at Fulham, and from thence to the private garden of Lord RAVENSWORTH; but, preferring nursery-work, he found his way into Messrs. RICHARD SMITH & Co.'s Nursery at Worcester, where he gained a good insight into out-door and office-work, and from thence, twenty-seven years ago, he came to Ealing to take charge of Messrs. LEE & SON'S Nursery there; certainly a praiseworthy record for a man yet in the vigour of his prime. A large company was present, and the dinner passed off in a satisfactory manner.

WOOD PAVING—Since the previous note on this subject was penned, the writer has observed a paragraph in the daily press, in which it was stated that sundry streets in Paris are being paved with Mahogany blocks! This is not the case, as the same woods are being used there as in London—Jarrah, the produce of *Eucalyptus rostrata*; and Karri, another member of the great genus *Eucalyptus*. The Jarrah has been most used with us, probably, but the Red Gum is coming to the front. Western Australia is the source whence the supplies are drawn, and the area now being extensively tapped exceeds, or at any rate equals that of Great Britain. The forests are not far distant from seaports, and the trade is being largely developed by our merchants and contractors. The results obtained in Australian towns are very satisfactory—doubtless the same record will be given here of the Australian hard-wood pavements.

A NEW HORTICULTURAL SOCIETY.—The old Reigate Rose Association, Mr. R. E. WEST writes, having ceased to exist, it has been proposed to form a new one, to be called The Reigate and Redhill Horticultural Association, and that it may be established on a wide and popular basis, to unite it with the Reigate Cottage Gardeners' Society. At a meeting of the committee of the latter, held December 2, this project was agreed to, and I was then appointed their Joint Hon. Sec. (*pro tem.*), with Mr. W. WELLS, and requested to collect names of those who are willing to become members of the new association. It seems important that the Reigate district, so famous for Rose-growing, should not remain without a representative society of this kind, and already several promises of liberal support, both in annual subscriptions and special prizes, have been given. The Rose section of the united societies will be under the rules of the National Rose Society.

THE REIGATE AND REDHILL HORTICULTURAL ASSOCIATION.—This Society has, we learn from another source, started auspiciously with a fair amount of subscriptions promised from residents in the town and neighbourhood, and also from persons at a distance, besides six special prizes offered for the best six dishes of out-of-door fruit, for Roses, for table-decoration, for table-plants, &c. The date of the show next year is fixed for Wednesday, July 4; and an excellent schedule of prizes will be offered, the awards including the National Rose Society's Medals.

FLOWERS THAT LAST.—Among other flowers this Christmas time we have a few of *Ornithogalum lacteum*, that have been kept nearly three months. About the end of October last some scapes of this handsome plant were handed to us by Mr. CHARLES AYRES, of Cape Town, who had brought them to England, and which he had cut from the plants on October 10. Many of the flowers at the base of the raceme had already expanded when we put them into water. During the whole time since then until now, they have been very attractive, and fresh flowers have been constantly opening towards the apex of the scape, and as far as it is possible to see, they will remain so until beyond the 10th of January, or three months after the date on which they were cut. There are few flowers that will last so long as this, and it is certainly quite unusual to cut one's

flowers for Christmas decoration so early as the 10th of October. This plant, like several other of the greenhouse species of the genus, has been known in England a long time, though it is very generally neglected—indeed, it is rarely seen in our private gardens. *O. lacteum* was introduced from the Cape in 1796, and has been several times figured. A good one may be seen in the *Botanical Magazine*, t. 1134, where the handsome appearance of the scape is well represented. The scape is often $2\frac{1}{2}$ feet high, and produces close upon a hundred flowers, placed closely together. The flowers are rather more than an inch broad, and the petals are quite white; the superior ovary is green, and there are six stamens, bearing pale yellow anthers. The culture the plant requires is of the very simplest, and treated with fair liberality in an ordinary greenhouse, it will prove of little trouble.

BIRMINGHAM BOTANICAL AND HORTICULTURAL SOCIETY.—We learn from a schedule recently issued, that it is intended to hold a Narcissus (*Daffodil*) Show in the Botanical Gardens, Edgbaston, on Wednesday and Thursday April 18 and 19 next, when prizes in accordance with the schedule will be awarded. The Edgbaston Gardens will be opened on the first day of the show at 2 P.M., on the second day at 9 A.M., and will be closed at half-past 7. W. HILLHOUSE, M.A., is Hon. Secretary; and F. W. BURRIDGE, Esq., F.L.S., will act as Judge.

PEEBLES HORTICULTURAL ASSOCIATION.—The members of this body met at the Lesser Good Templars' Hall, at Peebles, on Wednesday, the 13th inst., Mr. SLATER presiding; and on this occasion Mr. FOREST read an excellent paper on the "Carnation." Mr. L. MACKINTOSH, gardener, of King's Meadows, exhibited some Carnation-stakes, which were stated to be more useful and lasting than Bamboo. After a discussion on the foregoing, Mr. MACKINTOSH read a paper on "Root-pruning."

TRINIDAD.—Our valued correspondent, Mr. J. H. HART, is delivering a course of six lectures on Botany at the Victoria Institute, Port of Spain, Trinidad. Incidentally, he gives an amusing illustration of the usual worthlessness of popular descriptions of plants as a means of identification, and of the occasional value of such descriptions. A lady, it appears, desirous of information wrote a long description of a plant, such as that the blossoms were "minute, powdery, like small feathers," which afforded no clue as to what was meant, till she added that the flowers were succeeded by a row of boot-buttons! when Mr. HART was enabled to identify the plant as a *Phytolacca*.

THE SURVEYORS' INSTITUTION.—At the ordinary general meeting, held on Monday, December 4, 1893 the President (Mr. CHARLES J. SHOPPEE), in the chair, a paper was read by Mr. R. GODFREY (Fellow), entitled "The Local Government Bill, 1893" (generally known as "The Parish Councils Bill"). A discussion followed and was concluded, and a vote of thanks was unanimously passed to Mr. GODFREY for his paper. The next ordinary general meeting was held on Monday, December 18, when a paper was read by Mr. E. J. CASTLE, Q.C. (Associate), entitled "The Valuation (Metropolis) Bill, 1893."

SNAKE BITE—MR. STOREY, Superintendent of the gardens of the Maharaja of Odeypore, in his annual report says: "I regret to record the death of one of the gate-keepers. The poor fellow, after taking his evening meal, laid out his bed in the lodge, and went outside to have a chat with some of his friends. During his absence, a large snake, a cobra, unobserved, entered his bed and coiled itself under the mattress, and lay there all night. The poor old man, knowing nothing about it till he went to roll up his bed in the morning, when the reptile bit him on the right hand. He ran to the nearest workmen, telling them what happened, and begged of them to cut off his hand with his sword; but none of them had courage to do so. I sent for

Dr. SHEPHERD of the Scotch Mission, but this gentleman was visiting a patient a long distance away. He very kindly came with all speed to the old man's assistance, and did all he could for the poor fellow, but he died at 10 A.M. the same morning."

"REVUE DE VITICULTURE."—A special journal devoted to the interest of wine-growers is about to be established by M. VIALA and M. RAVAZ. M. VIALA's splendid book on the diseases of the Vine, which we noted some time since, affords assurance that the new publication will be one of high tone and great utility. The *Revue de Viticulture* will take cognizance of all points connected with the Vine and its culture. No doubt the publication will be of great use in our wine-growing colonies, and will be of service even in countries where the Vine is grown though no wine is made. The publishing office is Rue de Mirbe¹, 4, Paris.

WINCHESTER GARDENERS' ASSOCIATION.—On Thursday, Dec. 14, a lecture on the "Chemistry of Soils" was given by Mr. C. W. HERBERT GREAVES, under the auspices of the Technical Instruction Committee of the Hants County Council. In a lecture on the same subject, delivered a fortnight previously, Mr. GREAVES had discussed the substances forming the bulk of soils, namely, sand, clay, humus, and limestone, giving the chemical and physical properties of each, describing its function in the soil, and showing how any excess of either of these components could be corrected. On the present occasion, the true plant-foods were considered in some detail, and the use of chemical analyses of plants and soils was explained. The lecturer recommended the establishment of experimental plots, with a view to ascertaining the requirements of any particular soil, remarking that the results obtained from these would generally be of greater service to practical gardeners than actual chemical analyses, although the latter were frequently invaluable. In conclusion, Mr. GREAVES strongly urged his hearers to seriously take up the study of elementary science, particularly chemistry. The lecture, which lasted for more than an hour and a half, was listened to attentively, and was followed by questions.

HORTICULTURAL EDUCATION—We take the following from Prof. BAILEY's address to the Agricultural Association of Cornell University, Ithaca, New York:—"The fruit interests of New York are greater than those of any other State, save only those of California. The cultivation of the finer plant products is yearly becoming more attractive and profitable to those who understand it, and it is the chief encouragement to small holdings of land. One division of horticulture has been entirely overlooked in educational institutions. This is floriculture, which is probably expanding more rapidly as a business than any other agricultural occupation. Two years ago, nearly 20,000 people were engaged in commercial floriculture chiefly under glass, and the value of the product was over 26,000,000 dols. It is an industry to which women are specially adapted, and about 2,000 women were engaged in it in the census year. Moreover, the amateur interest in flowers and ornamental gardening is enormous, probably even exceeding that of fruits in the eastern States. Yet there is no school in North America to which the florists can turn for professional instruction. The Society of American Florists, which is the strongest horticultural organization in America, has repeatedly urged the importance of floricultural education. There is probably no class of our population of equal extent which is entirely without the means of higher education. Here is an unexampled opportunity to make a signal departure in educational institutions. Shall Cornell first enter the field? For the equipment of a working plant in pomology, floriculture and kindred horticultural pursuits, a sum of at least 50,000 dols. is needed at once.

"MEEHANS' MONTHLY."—December closes the third volume of *Meehans' Monthly*, a magazine which is attempting the feat of combining what ordinarily would be the monthly parts of a work to be bound

into volumes for all time, with the general literature of transient magazines. In this issue we have the full history, with a living picture, of one of the beautiful prairie flowers, *Baptisia leucophæa*, one of the wild Indigos, with sixty-eight other chapters on wild flowers, popular natural history, fruits, vegetables, and garden history, and garden lovers. Among the latter are sketches of FRANCIS PARKMAN, the historian; ANNE PRATT, the painter of wild flowers; MENZIES, the explorer of the botany of the Pacific; Professor HAGAN, the entomologist; Professor PRINGSHEIM, the biologist; and last, but not least, the still living and widely-known Professor PEPPER of the Pennsylvania University, of whom a portrait is also given. The Roman Catholic Bishop, McQUAID, of Rochester, is described as a rare lover of gardening, and a sketch of his grounds given. Strawberries, which curiously sometimes have young plants growing from the berry in the place of seeds, are illustrated and explained. The publishers, THOMAS MEEHAN & SONS, Germantown, Philadelphia claim that no similar work gives as much instructive matter in so small a space, and of value for reference for all time, at so cheap a rate as this.

VITIS COIGNETIÆ.—No climbing plant, says *Garden and Forest*, except, perhaps, the *Ampelopsis tricuspidata* or *Veitchii*, of the same country, compares at this time in brilliancy of foliage with the Grape Vine of Northern Japan, *Vitis Coignetia*, a species closely related botanically and of the same general appearance as the North American *V. Labrusca*. In the forests of Yezo, *V. Coignetia* climbs into the tops of the tallest trees, filling them with its enormous leaves, which in autumn assume the most brilliant hues of scarlet. In the United States it appears to be perfectly hardy, and promises to present in autumn as brilliant a spectacle as it does in its native country. It is, both in the size of its foliage and autumn colouring, a much more desirable ornamental plant than any of the American Grape Vines; and it can be planted to advantage wherever sufficient space can be given it to climb among tall trees or to cover large arbors or other edifices. The fruit, late in the season, after it has been frozen, is eaten by the Japanese, who find it palatable; the flavour, however, is not much better than that of common wild Grapes, and it is only as an ornamental plant, or as a stock on which to graft less vigorous species or varieties, that *V. Coignetia* will be found in our gardens, where it seems destined to play an important rôle.

MR. J. O. GRIFFITHS, Q. C., is better known in legal than in gardening circles. But now that he is about to leave his native town (High Wycombe), his departure reminds us of the fact that he is one of the pioneers of public gardens and open spaces. Nearly twenty years since, when they were seldom heard of, Mr. GRIFFITHS followed up his presentation of a free library to his birthplace by purchasing and presenting to Wycombe the "Frogmore" Gardens.

A WELL-EARNED TESTIMONIAL.—The *Essex Telegraph* of the 9th contains this pleasant little item: "MR. WALLIS P. BUTTRON has been presented with a very handsome dinner cruet, subscribed for by the members of the St. Botolph's (Colchester) Chrysanthemum Society, as a slight recognition of his able and energetic services as Hon. Sec. to the Society."

SOLANUM GUATEMALENSE, MELON-PEAR.—By this post we send you specimens of the new fruit, stock of which we have been distributing the last few years—*Solanum guatemalense*, or Melon-Pear; and we think when it becomes better known, it will be very popular, as it succeeds Melons, and will prove not only a valuable addition but a great ornament to the winter dessert table. It is easily cultivated, and the fruits sent have been ripened in a cool greenhouse. Like the Melon, we find the flavour improved by the addition of a little fine sugar. *R. H. Vortegans & Co.*"

AMERICAN MARKET GARDENS.—M. H. DE VILMORIN gives, in the last number of the *Journal*

de la Société Nationale d'Horticulture de Paris, some interesting statistics, which suffice to show the vast extent of the industry in the States. In 1891, 216,765 men, 9,254 women, 14,874 children, and more than 75,000 horses or mules were engaged in the work, over a total area of 534,440 acres, yielding a net revenue of over 397 millions of francs. Further details show that the area devoted to Asparagus was 37,000 acres; Cabbage, 77,000 acres; Celery, 15,000 acres; Spinach, 20,000; Pastèques (Water Melons), 114,000 acres; Peas, 56,000 acres; Sweet Potatoes (Patates), 28,000 acres; Tomatoes, 22,000 acres; and miscellaneous, 82,000 acres. M. DE VILMORIN comments on the fact that so large a proportion is devoted to watery vegetables, and so little relatively to farinaceous ones, and attributes it to the greater heat experienced; for even in the North-East Atlantic States the climate is very hot in the summer months.

"LE PETIT JARDIN."—Whilst in this country we boast at least nine weekly gardening papers, and whilst there is scarcely one of the local papers throughout the country which has not its gardening column, it appears that in France up to this moment there has not been a single weekly journal devoted to gardening! The present publication is intended to fill that void, and is addressed to the same class of gardeners as that to which the supporters of our penny papers belong—amateurs and others. We cordially wish our newest *confrère* all the success which we doubt not awaits him.

DIVIDING PLANTS AMONG SCHOOL CHILDREN FOR CULTIVATION.—We read in the *Gartenflora* for November, that in the neighbourhood of Seglitz the school children receive from the Seglitz Horticultural Society plants in variety for further cultivation, and it is hoped that by so doing the children will have greater regard for trees, &c., and not be guilty of wilfully injuring them. It may be of interest to some of our readers to hear in what way the plants are given to the children, and that after the lapse of four or five months they are brought to the school again for exhibition, and prizes awarded to the most worthy. About the middle of May the children received each two plants gratis, boy and girl alike. In this school there were 170 scholars. This year the plants were *Pelargonium peltatum* and the perpetual-flowering *Carnation Grenadier*. Each plant has attached to it the Society's leaden mark (Kreins plombe), together with a little sheet of printed directions with regard to the cultivation of the plants. Besides this the children are given by the society the necessary quantity of soil for repotting purposes, which is kept in stock in a stable. At the end of October the children bring their plants to the Society's rooms. The pots are stood in a row, each with its number, and four or five judges give their awards. This year the available funds were but 50s., and this sum was divided in this way. For *Pelargonium peltatum* one child received as first prize 3 mk., = 3s., and the Society's Certificate; five children got each 2 mk.; eight children, each 1½ mk.; and ten children each ½ mk. For *Carnations*, one child received 1½ mk.; five children each 1 mk.; and seven children ½ mk. each. We note this little bit of school horticulture because it seems to be just one of those things that our rural societies might well take in hand, costing but little, and yet effecting much good.

GROWTH v. REPRODUCTION.—Mr. J. C. ANTRACER contributes to *Agricultural Science*, vol. vii. (1893), a paper read by him before the Society for the Promotion of Agricultural Science, and entitled, "A New Factor in the Improvement of Crops," in which he draws especial attention as to a novel, or at least a too little understood fact, to the principle that a "decrease in nutrition during the period of growth of an organism favours the development of the reproductive parts at the expense of the vegetative parts." Or, in plain English, that a plant cannot be expected to increase in individual size and to bear seed at the same time; that development cannot be maintained in all the organs at once.

One of the chief applications of this principle to practice relates to the management of farm and other crops where "by manuring, high cultivation, or otherwise forcing a greater yield, we are increasing the total product of stem, leaves, and roots much more than of seed and fruit."

PUBLICATIONS RECEIVED.—*Bulletin of United States National Museum*, No. 44—*Insect Life*, vol. vi, No. 2.—*Bush's Bromley Budget*.—*Bulletin de la Société Linnéenne de Paris*.—*Pharmaceutical Journal*.—*Handelsblatt für Deutschen Gartenbau*.—*Agricultural Science*.—*Museum d'Histoire Naturelle*.—*The Exchange Catalogue of Seeds from the Jardin des Plantes* has been published. Applications should be made to the Director, 57, Rue Cuvier, Paris, before the 31st inst.—*Dictionnaire Pratique d'Horticulture*, liv. 20. (O. DOIN, Paris).—*Chelsea, Illustrated*. (PIKE & Co., Brighton).—*Jardin des Plantes de Montpellier, Seed Catalogue*.

PLANT PORTRAITS.

ARENARIA MONTANA, *Garden*, December 2. A pretty little rock plant, with relatively large white flowers.

BERBERIS FREMONTI, *Newbert's Garden Magazine*, n. 23, p. 361 (1893). A pinnate-leaved species, with yellow flowers on long slender stalks, followed by small globose red berries. Colorado.

DIPLODENDIA ATRO-PURPUREA, *Garden*, November 25.

FRAXINUS RHYNOPHYLLA, *Garden and Forest*, November 22.

MAGNOLIA FRASERI, *Garden*, November 11.

MALLOTOPUS JAPONICUS, *Tokyo Botanical Magazine*, August 10.

PEAR DR. JULES GUYOT, *Bulletin d'Arboriculture*, &c. October.

PRENANTHES ALBA (Compositæ), *Meehan's Monthly*, November.

SALIX AMPLEXICAULIS, *Gartenflora*, November 15.

ASA GRAY.*

To those who had the pleasure and privilege of an acquaintance with Asa Gray, the perusal of these volumes will be delightful indeed. The great American botanist was so clear-headed and sagacious, yet so simple-minded, so modest, so free from jealousy and prejudice, that it is no wonder he was as much beloved for his personal qualities as respected for his erudition. The two volumes before us give an admirable presentation of the man as he was to his friends and colleagues. Seldom, indeed, have we read a biography so thoroughly well done. The whole story of Gray's life and work is told in the most complete and orderly fashion, and with such art that the work of the editor, great as it must have been, is nowhere obtruded. Its influence, however, is all the greater.

The volumes open with an autobiographical fragment which extends over the first thirty years of his life, and which is interesting, as giving details as to his early career which are not generally known. But the great charm of the book consists in the series of letters addressed to various friends and colleagues, and which are so complete and so well selected that, as we have already said, they give an excellent idea of the man as he was throughout his whole career.

We gather that the Grays emigrated to Massachusetts from the north of Ireland; whilst on the mother's side Gray traced his descent from one Thomas Howard, who came from Maidstone or its vicinity in 1634.

Of Gray's boyhood it is unnecessary to speak here. In 1826 he entered the Medical College at Fairfield in the State of New York, at that time the largest medical school in the country, except that at Philadelphia, but which was discontinued in 1840, passed the vacations in the surgery of a country doctor's office (it is called in these pages), and graduated from the college in 1831.

* *Letters of Asa Gray*, edited by Jane Loring Gray, in two volumes. (London, Macmillan & Co.)

During his career as a medical student, his botanical proclivities were aroused by the perusal in winter of the article on botany in Brewster's *Edinburgh Encyclopædia*. At that season he was out of reach, as he tells us, of a greenhouse or of a potted plant. But in the following spring he sallied forth into the woods and found an early specimen of a plant in flower peeping through the dead leaves. Taking it home he was enabled by the aid of *Eaton's Manual* to determine it as *Claytonia virginica*. This was the beginning. In 1830 he had occasion to go to New York, where he had an introduction to Dr. Torrey. Torrey was absent at the time, but responded to the young student's inquiries by letter, and thus began that intercourse which for many years rendered the names of Torrey and Gray as it were inseparable. In 1830 Gray gave his first course of botanical lectures at the college at which he had graduated, and gaining thereby an honorarium of forty dollars, devoted the sum to a tour in the western part of the State of New York, as far as Niagara, &c. This was the first of that long series of botanical excursions and travels which subsequently formed so important a feature in Gray's life. About this time we find him acting as a teacher in natural science in a school at Utica, teaching the boys chemistry, geology, mineralogy, and botany, and making with the boys very pleasant botanical excursions through the country round. In 1833 or 1834—for the date is not given with certainty—he met Dr. Torrey for the first time, and collected plants for him in the Pine barrens of New Jersey, subsequently availing himself of Torrey's invitation to act as his assistant during his course of chemical lectures. He still remained as teacher at the school at Utica, but made excursions during the vacations, excursions which enabled him to collect and distribute his first centary of American grasses and sedges, and to accumulate materials for his first paper in the *American Journal of Science* (on "Mineralogy").

In 1836, after a short period of uncertainty, we find him appointed Curator of the Lyceum of Natural History in New York, in which capacity he found time to assist Torrey in his projected *Flora of North America*. About this time there was a chance of Gray's visiting the South Pacific regions as naturalist to an expedition, but this fell through, he having accepted the Professorship of Natural History in the University of Michigan. In 1838 were issued, at the joint expense of the authors, the first two parts of Torrey and Gray's *Flora of North America*.

It soon became apparent that the North-American flora could not be properly worked up without consulting the herbaria and libraries of the great botanical centres in Europe. Moreover, the newly-constituted University was deficient in books; Gray, therefore, was allowed a year's leave of absence, a year's pay, and, in addition, a sum of 5000 dol., to be expended in books for the library. The young Professor, thus equipped, sailed in November, 1838, for Liverpool, whence, after a passage of twenty-one days, he proceeded immediately to Glasgow, and became the guest of Dr., afterwards Sir William, Hooker, then Professor of Botany in that University. Dr. (now Sir Joseph) Hooker was at that time pursuing his medical studies in the University.

Dr. Hooker received the young American with great cordiality and kindness, and thus commenced that long acquaintance with the two Hookers, which was so pleasant to them all, and of so much moment as regards the progress of botanical science. Provided with ample and excellent introductions, Gray then visited Edinburgh and London, making acquaintance with Greville and Balfour, Boott, Robert Brown, Lambert, Bennett, Lindley, Bauer, and all the botanists of the time, not forgetting Bentham, who gave him a full supply of letters to botanists on the Continent.

Among the visits then (1839) made was one to N. B. Ward, whose cultivation of plants in close cases attracted much attention. With Ward he went one day to dine with Menzies, then over ninety. This first visit to England was of great importance, as he then made acquaintance with our leading botanists, and that acquaintance soon deepened into

a warm and affectionate friendship, which was of life-long duration. In March, 1839, Gray left London for Paris, and there was as soon at home among the French botanists as he had been in London among the English ones. Proceeding on his way, he visited, to mention only the botanical centres, Lyons, Montpellier, Florence, Pisa, Padua, Venice, Trieste, Vienna, Munich, through Switzerland, to Geneva, seeing the De Candolle and Boissier. Thence he passed through Germaoy to Halle, Berlin, and Hamburg, and from the latter place back to London, and thence to New York. Everywhere he seems to have been well received, to have made life-long friends, and to have accomplished no slight amount of botanical work. This, as we have said, was the first of a series of similar visits at intervals, visits which were so agreeable to his hosts that in a spirit of true scientific good fellowship, Gray was never looked on here as a foreigner, but always as an Englishman. That the feeling was reciprocated is shown in these volumes by the circumstance that in after years, when political craft or unfortunate blundering had well nigh produced an estrangement between the nations, Gray was considered by his own countrymen as too much of an Englishman!

In 1841, Gray was elected Professor of Natural History in Harvard University, Cambridge, undertaking the duties of Professor of Botany and the charge of the Botanic Garden. This was the beginning of his long connection with the famous American university—a connection that lasted till his death. We have not space even to summarise his proceedings, which are delightfully narrated in his letters; but we must pass on to his second visit to Europe in 1850. Arriving in London, he was the guest of N. B. Ward, who had by this time removed to Clapham. He saw the Hookers, and, as usual, made the most of his time, visiting and sight-seeing, inspecting, among other things, the pinetum at Bayfordbury, where, he says there were 600 (?) species of Conifers in cultivation. From London, Dr. and Mrs. Gray passed into Belgium, and thence into Germany, Switzerland, Holland, and back to England, repeating the proceedings of his first visit, and making new acquaintances. In England he stopped with Bentham in Herefordshire for two months, busily occupied with botanical work. From Herefordshire he went to Ireland, to visit Harvey, and returned to work hard all the winter at Sir W. Hooker's house at Mortlake, where the herbarium then was, and where Sir Wm. Hooker was resident as Director of the Royal Gardens, Kew.

A third visit to Europe in 1855 was necessitated by the illness of a relative. The visit was of short duration (six weeks); but, as usual, Gray managed to do a good deal of botanical work in it.

And now comes a most interesting portion of Gray's life, that is, to botanists; it is the period, speaking roughly, when De Candolle's *Géographie Botanique* was published, when Hooker and Thomson published the first volume of the *Flora Indica*—unhappily too good to be completed, when Bentham issued his *British Flora*, when Robert Brown died, and when Darwin's *Origin* first made its appearance. Every naturalist knows how greatly the acceptance of Darwin's views on evolution was facilitated by the writings and advocacy of Asa Gray. His great knowledge of plants and their variation, his clear logical mind, his fairness and candour, matched only by those of Darwin himself, caused his associates to attach great weight to Gray's opinions; whilst to the outside public his persuasiveness, his high character, deep religious feeling, and acceptance (against Darwin in this particular) of the idea of design in Nature, gained him the ear of people who were repelled by the pugnacity of some of the early adherents of Darwinism, and who were unable to appreciate the technical details upon which the theory of evolution was based. Naturally this is a most interesting part of the book, but the story has been told before at greater length in *Darwiniana*, and in the *Life and Letters of Darwin*. We now come to that terrible crisis in the affairs of the United States when the disruption of the Union was threatened. From the first Gray took a clear view of the nature

and the necessities of the case, and devoted himself heart and soul to the cause of the North, in the full conviction—right, as circumstances proved—that that was the best course for humanity at large, and for America in particular. Gray was too old for active service in the field, but not too old to serve as a Volunteer. In connection with this stirring time is one of the few notes of the Editor. "It is hard to realise," she says, "in these days how all the community worked together in all possible ways; it was the business of life."

Gray's opinions as detailed in his letters are singularly clear and forceful, and they give a better idea to the general reader not conversant with the causes of the struggle, or familiar with the details of the war, its nature and its significance, than could be obtained by wading through volumes of history. Happily his botanical labours were not entirely interrupted, nor did his friendships with his old associates suffer any diminution.

In 1868 Dr. Gray, again accompanied by his wife, made another journey to Europe, staying in England with Mr. (afterwards Dean) Church in Somersetshire, with Darwin and the Hookers in Kent, and Tyndal. After working at Kew they went to Paris, and thence to Egypt, returning through Italy, Switzerland, and Germany, following the same mixed course of work and social intercourse as on former visits.

In 1872 he gave up the superintendence of the botanic garden, and had a holiday with Mrs. Gray in California, high festival being amongst other things held on Gray's Peak, 14,400 feet. On the journey we are told he wrote his well-known address to the American Association on the big trees "Sequoia and its history."

In 1873 he resigned his professorship, retaining, however, the curatorship of the herbarium. In the following year Gray passed the winter in Florida on account of his health, and where as he says in one letter "the botanising was delicious," one of the delights consisting in seeing the *Torreya* in its native locality. In 1876 there was a visit to the herbarium from the then Emperor of Brazil, whose scientific tendencies are well known, and an amusing account of the interview is given. In 1876 came a holiday in the North Carolina Mountains [see p. 773 of our present issue]. In the following year occurred that memorable journey with Sir Joseph Hooker, Engelmann, Hayden, Sargent, and Parry, to Colorado and California.

In 1880 Dr. Gray again sailed for Europe with Mrs. Gray, with the object of studying the herbaria for the new volume of his *Synoptical Flora*, devoting special attention to the *Asters*, which, from its extent and complexity, he calls a "rascally genus." On this occasion Spain was visited. Returning to Kew, he worked all the winter, passing again to Italy and Switzerland, and France in the following spring.

In 1882, Darwin died, and Gray writes of him:—"We hardly should have thought, twenty-five years ago, that he would have made such an impression upon the great world, as well as the scientific world. In that year the botanist paid a visit to Montreal, on the occasion of the meeting of the American Association for the Advancement of Science in that city, and took part in the proceedings when the British Association met in the same city two years later. In the same year Bentham died in his eighty-fourth year, not before he had completed, with Sir Joseph Hooker, the *Genera Plantarum*."

In the spring of 1885 Dr. and Mrs. Gray proceeded to New Orleans, and thence to Mexico, seeing much of interest, and being made much of, as was meet. The same desire to do honour to the veteran showed itself in the presentation to Gray, on the occasion of his seventy-fifth birthday, of a tribute of love and respect from the botanists of America. Some 180 American botanists, from all quarters of the vast territory of the States, took part in this manifestation, which surprised the recipient almost as much as it gratified him.

The last visit of Dr. and Mrs. Gray to Europe took place in 1887, when the usual routine of mixed work, travel and pleasure, was followed. In June

of that year he received at Cambridge an honorary doctorate, and, as might have been expected, was greatly interested in the ceremony. Oxford and Edinburgh paid him similar compliments in the same summer; and the Queen's jubilee, which was then being celebrated all over the kingdom, furnished the republican with a good idea of the solidity of our own monarchical institutions. But the end was approaching; and on January 30, 1888, that busy, happy, well-filled, useful life was at an end.

We have alluded to some of the more important incidents of his career, but naturally we have not dwelt at length on the extent and importance of his scientific work, neither is that critically treated in the volumes before us; but the story of Gray's life is so thoroughly well told that the reader will have no difficulty in supplying for himself the details he may require. A good Index makes it certain that the book will be valued in the future by botanical

changing to dark green, with lighter ribs; and niger, foliage bronze coloured, changing to dark green, with reddish ribs.

THE LATE EARL OF WARWICK.

In the death of the Earl of Warwick all interested in the cultivation and products of the land have lost a most considerate and faithful friend. Tenants, servants, and poorer neighbours had always his practical sympathy. The sylvan beauties of Warwick Castle are known throughout the world, and have been several times recorded in the *Gardeners' Chronicle*. But how much they were improved by the late Earl and his accomplished Countess is only known by those who have been acquainted with and taken an interest in this historical place during the last forty years. To all lovers and students of Nature, this demesne was

to him, as also were the many trees and shrubs brought by him or some member of the family from foreign countries. The Oak above-mentioned has a story belonging to it, which is, that the acorn from which it grew was brought from the famous Leamington Oak, germinating in a bottle of water. The late Earl was given to experimenting with tender plants, so as to prove their suitableness or adaptability to bear our climate; the grafting and inarching of fruit trees and Vines to improve the flavour of the fruit. Flowers of all species had a charm for him, but Daphnes, the Jasmine, and Roses were his favourite flowers, and among Roses, such old sorts as Lord Macartney's Banksian and Austrian Briars, which do so well on the Castle walls, were to him a source of pleasure. C.

HOME CORRESPONDENCE.

THE RED PYRACANTHA.—The evergreen Thorn may be said to be compensating us for the great lack of Holly berries this Christmas. In my own district all the plants I have seen, occupying open, sunny positions on walls are laden with an abundance of bright coral-red berries, and for ornamental appearance at the Christmas season there does not appear to be any other plant that can come near it. The walls against which the branches are trained are aglow with the ruddy fruit, the thick clusters of which display themselves for a considerable distance. To have this effective hardy plant in the best condition, it should be grown against a sunny wall on a south, south-east, or south-west position. I have seen trees on north and east aspects, or planted alternate with Ivy, or in positions where a good deal of shade fell; but no winter picture they could represent could compare for finish and expression with plants on a south wall, growing by themselves, in the full glare of the light and sun. The quantity and brilliancy of the fruit appear to challenge winter to do its worst, and yet have to admit here is at least one subject superior to its rage, bluster, and destructiveness. R. D.

EARLY SNOWDROPS.—A bunch of beautiful Snowdrops was gathered here to-day. This is the earliest date on which Snowdrops have been gathered at Ardgowan for the last forty years. *Thos. Lunt, Ardgowan Gardens, Greenock, December 18.*

ABUTILON VITIFOLIUM ALBUM.—I am sorry to see that the error as to the colour of this most beautiful and almost hardy shrub, into which the learned editor of the *Botanical Magazine* has unwittingly fallen, has been repeated and perpetuated in the last issue of the *Gardeners' Chronicle* on p. 751. The flowers of this beautiful shrub are there stated to be white, turning to a pale azure blue as they fade; this they certainly never do, as the white form remains pure white to the last. There are, however, two distinct forms of this shrub, one of them with pale porcelain-blue flowers, which was well and accurately figured on the coloured plate of the *Garden* in its number for March 10, 1883, from a plant which bloomed here for several years in succession. The plant has since died, to my great regret, as this handsome shrub, unfortunately, frequently does without apparent cause soon after producing an abundant crop of its lovely flowers and ripening a quantity of seed. I am informed by my correspondent, Mr. Archer Hind (to whose kindness I owe the possession of the white variety), that the seedlings from it occasionally produce blue flowers; but all that I have raised have invariably, when they bloomed, produced only white ones like their parent. My experience satisfies me that the two forms are quite distinct the one from the other, and never change. *W. E. Gumbleton, Telgrove, Queenstown, Ireland.*

HYBRIDS "SPORTING."—Referring to the note of "P. W." (p. 753), it would certainly seem that the same individual hybrid sometimes varies now towards one parent, now towards the other. I met with a case in point some years ago, not in an Orchid, but in a Thistle. Solitary plants of the hybrid, *Carduus pratensis* × *palustris*, occur occasionally in Surrey, and would doubtless be much more common were it not that *C. pratensis* is often beginning to fruit when *C. palustris* is only just coming into flower. This hybrid will flower twice in the season; at all events, if the first flower-

FIG. 120.—RICINUS COMMUNIS, VARIETY FROM ZANZIBAR.

students of succeeding generations, comprising as it always of easy access, and at all times, when the does, so much of the history of botany in the present century.

RICINUS, ZANZIBAR VARIETY.

In this plant, of which, through the kindness of Messrs. Haage & Schmidt, seedsmen, of Erfurt, we are enabled to afford our readers an illustration (fig. 120), is a variety of the common Castor-oil plant, received by them from Eastern Africa. It is said to represent an entirely new and distinct form. The plant, which has enormous leaves, attains to a large size, and surpasses in beauty all hitherto known varieties. The leaves are of a light green colour, 2 to 2½ feet in width, with whitish ribs; it is admirable to plant for a single specimen or a group.

There are several varieties, viz., maculatus, with coppery-bronze leaves, which have reddish ribs when mature; cinerascens, brownish-purple leaves,

pleasure and advancement of the public could be furthered, the late Earl could be reckoned to afford hearty support. Last year, when the Royal Agricultural Society of England visited Warwick, the Park was placed at their disposal, and all connected therewith were unanimous in saying the site was the best fitted, and the most picturesque that could have been found. On that occasion the Prince of Wales and Duke of York stayed at the Castle. In the Park, or private grounds, the Warwick Cottagers' and Amateurs' Horticultural Society has always found a site for their annual show, and other societies in the neighbourhood have all benefited by his generosity. The giant ancestral trees, especially the majestic Cedars, with their legends and stories, the commemorative trees, of which there were two planted by the Prince Consort and the Queen in 1854, and the young trees raised from their seed from cones he had gathered, were subjects of interest

stems be cut down. The particular plant referred to produced stems, in early June, which bore flowers much resembling those of *C. pratensis*, while the stem-leaves were only slightly decurrent; when visited again in the autumn, the same plant had produced fresh stems, which bore flowers much more towards the other parent, while the stem-leaves were strongly decurrent. This hybrid so evenly divides the characters of its two parents, themselves so distinct from each other, that it may well be recommended to the attention of those who still believe that they have "never seen a natural hybrid." *W. H. Beeby*. [See *Gardeners' Chronicle* in January and February, 1891.]

MYRTLE BERRIES—*Myrtus communis* seems this year to have found its Italy in England (see p. 752), and on November 30 I saw a bush bearing many of its ripe purple berries, covered with a dense blue bloom on an open garden-wall at Straffan, co. Kildare. It is quite a common wall shrub in South Ireland, as also all round the coast, but its fruiting seems to be a far more uncommon occurrence than its flowering in Ireland. *F. W. Burbidge*.

PHYSALIS ALKEKengi FOR DECORATIONS—A useful fruit to use in winter decorations is the *Physalis Alkekengi*, the fruit being enclosed in a large bright, orange-scarlet inflated calyx. When the shoots are gathered before being damaged by wet, they last many months in condition, only losing colour in a small degree. It is very handsome when arranged in tall vases with dried grasses or winter berry-bearing plants. The *Physalis* is very easy to grow in a light warm soil, spreading about in a weedy way. In spite of this, one seldom sees a good vase of it, although it is remarkably bright on an autumn day. A small reserved-bed is worth growing in large gardens, simply to give handfuls of the bright shoots for winter decoration. *V.*

HEATHERBANK, WEYBRIDGE HEATH.—While about at Oakwood taking advantage of the good weather looking to the moving of plants and making alterations, I was struck by how much there is to be found in gardens pretty even in winter, and think that what I saw may perhaps be worth a note. The glories of the autumn tints of the *Liquidambar* tree have departed, some of the deep red leaves of *Vaccinium pennsylvanicum*, and of *Andromeda arborea* still hold on. There are not many flowers out, most are on mounds, for which I have a weakness, thinking that plants show themselves better on them than on level ground, and where precautions have been taken against soil washing down, thrive well. There are some *Primroses* of many colours, hardy *Cyclamens* with their prettily marked leaves, some with flowers; one of the prettiest is *Cyclamen cypricum*, which I had from Mr. Max Leichtlin, the flowers though small, are very pretty, it is a free flowerer, and the leaves have rich and distinct markings; *C. macrophyllum* has fine leaves, and stands the winter with us. One plant has held its flowers well in a sheltered situation, notwithstanding some sharp frosts, *Cheiranthus mutabilis*; it was a favourite of the late Rev. Harpur Crewe, who gave it to me—it is well to take cuttings of this, as hard winters kill it. A few *Gentianellas* are out, and one or two *Hepaticas*. *Helleborus maximus* is still very pretty. A fine large form of *Harebell* keeps throwing up flowers; this was given me by a gardening friend, who has made all forms of *Campanula rotundifolia* a study. The Cornish *Heaths* have a few flowers. *Andromeda floribunda* always well deserves its name, and is loaded with buds. What show well are the many shades of green on some plants, and dark and light brown of faded leaf-stalks and flowers on others. The large bunches of dead flowers of *Hydrangea paniculata grandiflora* look very well in the distance, and *Polygonum compactum* holds its leaves and seeds both of a very pale shade of brown. Many of the glaucous and pale grey-leaved plants are pretty; *Meconopsis nepalensis*, with its hairy leaves studded with rain or dewdrops, one of the prettiest. French Lavender (*Santolina incana*) and *Agrostemmas* are pretty greys. In one of the ponds, *Myriophyllum proserpinacoides*, given me by the late Sir William Bowman, is still green, with its prettily cut leaves. *Diplopappus chrysaophyllus* is very cheerful-looking. *Arenaria tetraquetra* has pretty compact foliage. Mossy Saxifrages and Wild Thyme, rich green. The part of the garden where the view is the prettiest is in the middle of the wood looking west. In a recess under the trees, Oaks and Birches with their autumn tints come first; Camellias with rich, glossy green leaves, these are well set with buds; then *Retinospora squarrosa*, *Cryptomeria elegans*, blue

Spruce (small), *Retinospora pisifera aurea*, *Cupressus Lawsoniana lutea*, *C. L. viridis erecta*, blue Cedar, especially pretty; *Veronica Colensoi glauca*, *Hydrangea paniculata grandiflora*, with large bunches of faded flowers; *Andromeda japonica*, covered with red buds; *Polygonum compactum*, with pale brown leaves and seeds; *Kalmia angustifolia variegata*, *Berberis Fortunei*, with its small bright red leaves; *Eulalia gracillima*, still holding green (both this *Eulalia* and *E. zebraea* have flowered well this season); *Veronica verrucosa*, *Skimmia oblata*, a bank of *Rhododendrons*, *R. Wilsonianum*; *Ladums*, with their buds; *Sciadopitys verticillata*, *New Zealand Flax*, flourishing alongside a great plant of *Bog Myrtle*,—all these together make a pretty picture. I have no doubt that many other pretty plants might be found, but fear that the note is already too long. *George F. Wilson*. [Received in November.]

BELGIAN ORCHIDS.—In the month of October I had the pleasure of visiting a few places in Belgium, including Laeken, the royal gardens at Brussels. In the Orchids at this fine place were some very good *Cattleya labiata*, *Lælia purpurata*, *Cymbidium eburneum* and *C. Lowii* (with twenty-seven spikes) *Odontoglossum crispum*, *O. grande*, and *O. vexillarium*, all of them looking well. I noticed a new winter garden in course of erection, connected by corridors, which are planted with creepers, &c., and lighted with the electric light. At Mariemont, the residence of M. Waroqué, some very fine pieces of *Cattleya labiata* var. *Waroqueana* were remarked with large sheaths, which will form a grand sight when they flower; a plant of *Lælia anceps* was noted which was 3 feet in diameter. *Cypripediums* were very well cultivated here, a plant of *C. Harrisianum* being 4 feet across, and there were many more fine specimens. The *Vandas* were of remarkable goodness, and healthy-looking, and the plants of *Lælia purpurata* were well grown. Of *Odontoglossum crispum* some very fine plants and varieties were noted, besides a number of excellent *Anthurium Scherzerianum*. At the establishment of *L. Horticulture Internationale*, many *Cattleya labiata* were in flower, and *Vandas*, which were remarkably fine, as were *Lælia purpurata*. The *Odontoglossums* surpassed all that I have previously seen. I remarked that more water, more ventilation was afforded, and not so much heat as is customary in England; but in my opinion the excellence of the Belgian Orchids is due in a great measure to the climate. *M. W.*

EARL'S COURT PRIZE MONEY (see *Gardeners' Chronicle* p. 754)—I should imagine "A Sufferer's" letter will be echoed by many fellow-sufferers. It is, however, rather surprising, and does not say much for the discernment of horticulturists, that so many good names were caught by such a bait, and induced to take part in exhibitions of such a character. After all, enlarge it as you will, call it by whatever name you choose, a tea garden remains a tea-garden, and cannot, by any process of horticultural alchemy, be transformed into anything higher. It will probably occur to the sufferers' minds that "the illness of one of the officials" is scarcely a sufficient reason for non-payment of debts, and that it might perhaps have been better to defer the complimentary dinners and congratulatory speeches until after the unfortunate exhibitors' just claims had been satisfied. We have changed many things in these latter days, and we often appear to forget in reversing the conclusions of our ancestors that a certain amount of wisdom still lingers in such ancient adages as the one about being just before you are generous. *Charles Noble*.

ALLOTMENTS.—Your excellent leader (p. 688) touches a question of the greatest interest to the working-man, who has the one great ambition to occupy and cultivate a bit of ground. Philanthropists may safely support and encourage such a commendable ambition, as the means of providing healthy, innocent, and profitable recreation, both for body and mind, of the indoor workers and others. In suburbs of towns and populous villages, allotments are the only means of enabling men to obtain the opportunity of holding a bit of land, which necessarily in such cases can only be obtained at a considerable distance from their houses. Moreover, these town workers have more time on hand, their hours of daily toil being shorter, and the Saturday half-holiday also; but for the rural districts, where nearly all the labourers are employed in agricultural pursuits, an enlargement of the cottage gardens to the orthodox quarter of an acre would be found far preferable, for the long hours of farm labour, with the distance allotments must be from so many of

their homes, would sorely handicap them. In scores of villages and rural districts, the land belongs to the same landlord as the cottages. Of course, there would be the expense of the fencing, but the rent and rates of the increased area should be added to that of the cottage, and would doubtless be cheerfully paid. If this was considered unfair, which may be so in some cases, a further charge of 5 per cent. or so should be included upon the first outlay. Such an arrangement would have permanent and desirable advantages as regards sanitary matters, for the pig-stye and other out-offices could be relegated farther away from the dwelling. Manures, decaying vegetable matter, ashes, slops, &c., could be better dealt with. In more than one remote country district where the population was entirely agricultural, I have seen allotments go out of cultivation, and which, consequently, had to be restored to ordinary farm cultivation. On the other hand, I have seen results the very reverse of this; and at this moment I have in my mind's eye a notable example where a man grows Roses entirely on his allotment, with a very considerable financial success too, for he is increasing his area, and his Roses are of the very best, as demonstrated at local shows. This shrewd man will soon be a formidable rival to the trade. Being such an enthusiast, his plants are good and cheap, produced at the lowest cost, viz., by his own labour. It is to be expected that when the Parish Councils Bill becomes law, the members of the elected Council will consider this matter of amicably enlarging as many of the cottagers' gardens to one quarter of an acre where possible, instead of pushing on allotments *en bloc* wherever they can be got. Having been sometimes called upon to award prizes for the best cultivated allotments, it has been distressing to observe what difficulties have to be overcome by cultivators in situations remote from dwellings in the loss caused by small birds, rooks, and ground-game. A man with a good garden close at home can often spare a few moments to attend to some details which he could not do if the garden were situated half a mile away from his cottage; besides, in field allotments there is seldom any provision for storing water, a matter generally overlooked, until a season like the last makes it plainly necessary. *W. Crump, Madresfield Court*.

THE FOREIGN AND THE HOME GARDENER—The British gardeners may learn a great deal from the Belgians; yet I think they could hold their own if they would pay a little more attention to the details of cultivation. Those correspondents who have discussed this subject have seemed to me to miss what I consider the most important feature in the Belgian system of Orchid growing, namely, the placing of stems of the tobacco plant under the stages and over the hot-water pipes, so that when damped and the house closed there is a strong smell of nicotine, which keeps their plants perfectly clear of insects without fumigation which, notwithstanding the greatest care, causes injury to the plants more or less; and I have tried nearly every invention under the sun to reduce the risk, and have at last settled down to steaming them with tobacco-juice till something better shall be found. If we could only get tobacco-stems at a reasonable price. The price in Belgium is about 2½d. per lb., and here it is 3s 6d. Is there not some means of inducing the excise to forego the duty on the stems of the plant for horticultural purposes? The lath-shading used in Belgium is likewise an advantage which the Belgian Orchid-grower possesses; still, they cannot grow *Cattleyas* better than we do—and I fancy it would puzzle any one of them to show an *Odontoglossum* that had been in his possession for twenty-five years, as I could do. *W. Stevens, Walton Grange, Stone*.

PRIMULA FORBESII.—I see it stated in a recent number of the *Gardeners' Chronicle*, that *Primula Forbesii* is an annual plant, and I should be glad to learn if this is an established fact, as the seed was sent out as that of a perennial species of somewhat doubtful hardiness. I raised a number of seedlings in March last, which came into flower very quickly, and these have continued in flower throughout the whole summer. Some weeks since the plants were repotted, and all flowering stems and buds removed, and they are still growing vigorously, and show no sign of having fulfilled their mission in life. Elsewhere I see *P. Forbesii* described as a biennial species, which usually flowers in November. Being a comparatively new introduction, probably its term of duration has not yet been accurately ascertained; but I shall be disappointed if this elegant little

Primrose proves to be only an annual, though from its great freedom in flowering it will probably be, in any case, but a short-lived perennial. It would be an advantage if it could be propagated by division, as I have found it impossible to save seed during the past season. *Primula Forbesii* is especially useful for a very shady position in a greenhouse, where little else will thrive, as it succeeds far better under than upon a stage in full exposure to light. *K. L. D.*

GRAPES AT ABBOTSWOOD, FURNESS ABBEY.—At this, the Lancashire seat of Sir James Ramsden, I noted when making a call this season some splendid examples of good culture. One house filled chiefly with the Black Hamburg, was a fine sight, the crop a heavy one, such as would alarm many growers, the bunches large and the berries also, whilst in colour there was nothing lacking, maturity having been arrived at. In another house were to be seen three varieties which are not often to be met with in company. These were *Mrs. Pince's Black Muscat*, *Muscat Hamburg*, and *Madresfield Court*, a triplet of black Grapes that cannot be surpassed for flavour and quality. Of the two first-named I have never seen a better crop, or bunches with finer finish, being at the same time weighty; *Madresfield Court* was also in good keeping with the other two. It is not often that *Muscat Hamburg* is now seen so fine as at Furness Abbey. Good bunches are met with occasionally at exhibitions; some fine examples were staged at the International Show in Manchester in 1881, and occasionally since then, but none that I have seen either north or south have come up to those just alluded to. Had Mr. Chesher exhibited them at any of our chief shows this past autumn his position would have been practically ensured. In another house were to be seen excellent *Muscats*, also *Lady Downes*, which for late work is not yet beaten. Grapes with but little flavour as compared with the foregoing do not evidently find any favour here, hence it is no surprise that *Gros Maroc* and *Gros Colmar* are not grown. One particular point in cultivation should be noted in these vinerias, the borders are all inside ones, as in front of them the lawn comes up close. This is an indication that the requirements of the Vines are thoroughly understood and attended to by Mr. Chesher, who has had this charge for about twenty years or so, which nearly approaches to the age of the Vines. The crops he assured me were not anything beyond the usual average, but such an average can only be arrived at by skilful culture. Peach-houses in the same range were filled with fine-bearing trees, from which the fruit had been taken, but the growth was all that could be desired. This range it should be stated faces towards the west, hence it meets the full force of the westerly gales which are more dreaded here than are keen easterly winds, which to many of us are a time of anxiety, if nothing more. *H.*

BULB, SEED, AND PLANT TRADE.—Since my letter appeared in your issue of the 2nd Inst., I have received from various parts of the country letters from those employed in the trade expressing their approval. From this great mass of correspondence, it is clear that the nearer we approach London the worse is the existing state of affairs, the climax being reached in some of the large concerns in the City, where the only inducement to accept the too often miserable conditions of employment seems to be the fact that situations in the provinces are more easily obtainable [?]. Provincial readers of this will get an idea of what to expect when applying for employment in or near London by the following extract from the letter of a correspondent in Hull referring to the case quoted in my letter. He says: "I had previously the intention to apply for the situation on condition that it included board and lodging," and then goes on to say: "About three years ago I applied to a firm near Bedford for a situation as Junior Assistant, after having served nearly six years to the trade. They consented to offer me as much salary as I could afford to accept under 18s. per week, meaning, I expect, about 15s. Now how was I to live on that and appear respectable, and pay 20s. in the bargain to the railway company to take me to the scene of action?" This is by no means an exceptional case, for if desired I will furnish any quantity of instances which will put this one entirely in the shade. It is impossible for me to reply to all the correspondence I have received since my letter appeared; but considering that a great many express their willingness to devote some of their time to help with the formation of an association for those employed in the seed and bulb trade, I may, in reply to those correspondents, say

that it will give me great pleasure to do my best to forward such a movement, which evidently has been for some time contemplated by those employed in the trade. I would suggest that an association be formed representing the whole of the Seed Trade of the United Kingdom; that an annual conference be held in different localities, and to which delegates would be sent from all the principal centres in order to bring forward and discuss any grievances relating either to the districts which they may represent, or throughout the trade in general, with a view to secure reasonable consideration of any matters connected with the trade, which might be submitted to them by a committee selected at the annual conference, and so bring about a better understanding all round. I would therefore suggest that all those desirous of forming an association to protect the interests of those employed in the seed and bulb trade, will send me their names and address, and at the same time state if they would be willing to take an active part in the formation of a local committee for their district. *Thos. D. Smith, 5, Dingle Road, Birkenhead.*

VERBASCUM WIEDEMANNIANUM.

The above novelty is a fine flowering plant from Northern Kurdistan, growing to a height of 2½ feet, much branched, and furnished very abundantly with indigo-blue changing to purplish-lilac blossoms, of 1 to 1½ inches in diameter. Its specific name commemorates a botanical traveller long since dead. It

FIG. 121.—*VERBASCUM WIEDEMANNIANUM*: FLOWERS BLUE.

is another of Messrs. Haage & Schmidt's new plants for 1894, and is likely to be a valuable addition to hardy border perennials.

Obituary.

FRANCIS PARKMAN—In the loss of this eminent historian perhaps it may not be generally known how largely horticulture also has been indebted to his enthusiastic, persevering, and intelligent investigations, which have left a marked impress on its progressive advancement.

His attention was first drawn to such pursuits by the hope of benefiting his health, and his active mind was not content to tread the beaten paths; he early began the extensive cultivation of herbaceous plants, mostly from seed, and his success with *Delphiniums* and *Phlox* was very marked, especially with the first named, of which his collection of seedlings was perhaps the finest in this country.

Early in his work a friend placed in his charge a collection of Evergreens, Lilies, &c., sent over by Dr. Hall from Japan, and this was probably the foundation of his fine collection of Lilies, in the hybridisation of which he achieved such fine results. "*Lilium Parkmanii*" is a notable example, and was afterwards sold by Mr. Parkman to Anthony Waterer of England. His assortment of rare ornamental shrubs was unsurpassed; Roses were also one of his

special studies, his collection being one of the most noted in the vicinity of Boston. He published a treatise on the Rose which was for many years the best American work on the subject.

In 1862 he connected himself in commercial horticulture, and for many years his collection of shrubs and plants were in active demand by growers; in July, 1862, he made the first public exhibition of *Lilium auratum* before the Mass. Horticultural Society; Messrs. Veitch & Sons had made a similar exhibit in England only a week earlier.

Mr. Parkman was president of the Massachusetts Horticultural Society from 1875 to 1877, and during many years was one of the most prominent exhibitors at its weekly shows. *American Florist.*

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

- 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending December 16, is furnished from the Meteorological Office:—

"The weather was again very unsettled, squally, and rainy during the greater part of the week, but towards its close some improvement took place, especially in the south and east.

"The temperature just equalled the mean in Ireland, N., but in all other parts of the United Kingdom it was above it, the excess over southern, central, and eastern England being 4°. The highest of the maxima were registered either on the 15th or 16th, and ranged from 58° in England, E., England, N.W., and the Channel Islands, to 54° in Scotland, N. The lowest of the minima were recorded on the 12th, when they ranged from 25° in Scotland, N., and Scotland, E. to 29° in England, E. and to 32° in the Channel Islands.

"The rainfall was considerably more than the mean over the country as a whole, but over the eastern and north-eastern parts of Great Britain there was no more than the normal amount.

"The Bright Sunshine was rather more prevalent

generally than it was during the preceding week, and exceeded the mean in all the 'grazing' districts, as well as in 'England, N.E.' and the Midland Counties. The percentage of the possible duration ranged from 35 in the Channel Islands, and from 27 in 'Ireland, S.' to 11 in 'England, S.' and to only 2 in 'Scotland, N.'

MARKETS.

COVENT GARDEN, December 21.

We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. ED.]

PRICES may vary much this week, on account of Christmas and Church decoration.

POTATOS.

The mild open weather with abundance of good and cheap vegetables, has a very depressing influence on our Potato market. Stocks continue to increase, and prices for most samples continue to fall. J. B. Thomas.

FRUITS AND VEGETABLES.

SPITALFIELDS: December 19.—Quotations:—Savoys, 2s. 6d. to 4s. 6d.; Cauliflowers, 4s. to 6s. per tally; Turnips, 1s. to 1s. 6d.; Carrots, 2s. to 3s.; Parsley, 1s. to 1s. 9d. per dozen bunches; Onions, 5s. 6d. to 6s. 6d. per bag; English do., 6s. 6d. to 7s. per cwt.; Apples, 1s. 3d. to 8s. per bushel.

STRATFORD: Dec. 19.—The supply to this market during the past week has been excellent, and a good trade was done at the undermentioned quotations:—Cabbages, 1s. 6d. to 2s. 6d. per tally; Savoys, 1s. 9d. to 5s. do.; Greens, 1s. to 1s. 6d. per bag; do. 1s. 3d. to 2s. 6d. per dozen bunches; Cauliflowers, 9d. to 1s. 6d. per dozen; do., 3s. 6d. to 7s. per tally; Brussels Sprouts, 1s. 3d. to 1s. 9d. per half-sieve, do., 2s. 3d. to 2s. 9d. per bushel; Celery, 6d. to 1s. per roll; Horseradish, 1s. 6d. to 1s. 9d. per bundle; Turnips, 1s. 3d. to 1s. 6d.

per dozen bunches; do., 20s. to 40s. per ton; Carrots, household, 40s. to 5s. do.; do., cattle-feeding, 28s. to 36s. do.; Parsnips, 9d. to 1s. per score; Mangels, 22s. to 26s. per ton; Swedes, 18s. to 25s. do.; Onions, English, 150s. to 170s. do. do., Dutch, 6s. to 6s. 6d. per bag; Apples, English, 2s. to 8s. per bushel.

FARRINGTON: Dec. 21.—Quotations: Celery, 9s. to 10s. per dozen; Sprouts, 2s. 6d. per bushel; Carrots, 1s. 9d. to 2s. per dozen bunches; Turnips, 3s. to 3s. 6d. do.; Horseradish, 1s. 6d. per bundle; Onions, English, 8s. to 8s. 6d. per cwt.; Parsnips, 3s. per cwt.; Case Onions, 7s.; Walnuts, 9s. per bag; Tomatos, 8s. per case; English do., 7d. per lb.; Pears, 2s. 6d. per basket of 15; Apples, cooking, 4s. 6d. to 5s. 6d. per bushel; do., Blenheim, 7s. 6d. do.; Grapes, English, 1s. 3d. to 1s. 6d. per lb.; Almeida, 10s. 6d. to 12s. 6d. per barrel; Oranges, 11s. per case.

POTATOS.

BOROUGH AND SPITALFIELDS: December 19.—Quotations ranged between 35s. and 100s. per ton.

STRATFORD: Dec. 19.—Quotations:—Magnums, dark-land, 35s. to 45s.; do., light-land, 45s. to 65s.; Bruces, 45s. to 70s.; Scotch Magnums, 60s. to 80s. per ton.

FARRINGTON: Dec. 21.—Quotations:—Main Crop, 75s. to 80s.; Sutton's Abundance, 60s. to 70s.; Bruces, 55s. to 65s. Magnums, 45s. to 50s.; Imperators, 40s. to 50s. per ton.

LONDON AVERAGES: Dec. 20.—Hebrons, 80s. to 100s.; Regents, 60s. to 80s.; Dunbars, 70s. to 90s.; Snowdrops, 70s. to 85s.; Blacklands, 45s. to 55s.; Magnums, 40s. to 55s.; Main Crop, 60s. to 80s. per ton.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending December 16, and for the corresponding period in last year:—1893: Wheat, 28s. 9d.; Barley, 28s. 10d.; Oats, 18s. 5d. 1892: Wheat, 26s. 4d.; Barley, 24s. 6d.; Oats, 16s. 10d.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 140s. to 151s.; new, do., 125s. to 145s.; inferior, do., 100s. to 120s.; Hay, best, 145s. to 170s.; inferior, do., 90s. to 100s.; new Mixture, 115s. to 130s.; and Straw, 35s. to 55s. per load.

BOOKS: *A Young Gardener. The Tomato: its Culture and Uses.* By W. Iggulden. Published at the office of the *Journal of Horticulture*, 171, Fleet Street, London.—*A. L. M. The Gentlewoman's Book of Gardening*, published by Henry & Co., Bouverie Street, London.—*Rogator*. There is a *Manual of Botanic Terms*, by Dr. M. C. Cooke, which may be had for a small cost if it is still in print; or you may profitably consult Holmes' *Botanical Note book* (Christy & Co.).

CATS IN GARDENS: J. B. G. Nothing short of putting an unclimbable fence round the garden will keep them out.

CHRYSANTHEMUM, LATE WHITE-FLOWERED: J. B. Miss Marechaux, new; or Ethel, an old variety. The first is to be preferred.

DISEASED WHEAT FROM THE CAPE: *Triticum*. The fungus is *Urocystis occulta*, one of the *Ustilagineæ*, or smuts, which in Europe most commonly attacks Rye, but sometimes other Cereals and Grasses. M. C. C.

HEATING OF TOMATO-HOUSE 10 X 7 X 125 FEET: *A Young Gardener*. If the house be a lean-to, three rows of 4-inch hot-water pipes would suffice, and if it be a span-roofed structure, employ four rows, i.e., two on each side, with valves so placed that the pipes on one side may be used alone when it may seem desirable. If you are resident in a cold northern locality, rather more piping may be needed than we have stated.

INSECT ON PEAR-SHOOT: A. G. L. The insect is the Pear-tree scale, which, unless it be destroyed, will seriously affect the fruitfulness of the tree. It may be got rid of by washing or painting the branches with petroleum emulsion, which may be bought at the florist's; or it may be made in the following manner:—Soft-soap, 1 quart; or hard-soap, $\frac{1}{4}$ lb.; 2 quarts hot-water, and 1 pint petroleum. Stir till it is thoroughly mixed, then add hot-water till the petroleum forms but one-fiftieth of the whole. For safety's sake, it should be stirred while being used.

MYRTLE: F. S. See p. 752.

NAMES OF FRUITS: E. H. Apple Alfriston.—December, 1, King of the Pippins; 2, Fearn's Pippin; 3, 3, Sturmer Pippin.—F. R. Colonel Vaughan.—T. S. Not recognised.—M. Hartwell. Green Apple Grenadier, White Apple Lord Derby.

NAMES OF PLANTS: D. Wallace. *Jasminum Sambac*.—W. M. A species of *Diosma*; send when in flower.—Calla. 1, *Epidendrum cochleatum*; 2, *Celia bella*; 3, *Epidendrum ciliare*; 4, *Calanthe* x *Veitchii*: the other two are *Calanthe vestita*, yellow-eye, and *C. vestita*, red-eye.—J. & A. B. *Cymbidium giganteum*.—G. D. *Trichopilia tortilis*; 2, *Maxillaria picta*; 3, *Cypripedium insigne*. W. H. *Lastrea Sieboldi*, *Oncidium lanceum*: the other not *Cymbidium Lowianum*, but a good form of *C. giganteum*.—W. H. B. *Maedevalia caloptera*.

PASSIFLORA CÆRULEA VAR. CONSTANCE ELLIOTT. T. J. D. We cannot account for your plant, which is on a south wall, not fruiting last season, and should have thought that the unusual warmth would have favoured fruiting. Was the soil destitute of moisture, and thus have caused the blooms to fall ere they were fertilised?

THE CULTIVATION OF HORSERADISH: *Radish*. We may refer you to our Calendar for the Kitchen Garden in our issue for the 2nd of the present month.

THE SO-CALLED YORK ROSE: S. J. This is probably the double-flowered form of the white Rose of our hedgerows, *Rosa arvensis*. The white Rose made use of at the wedding of the Duke of York was not of that variety, but a white Provence with a calyx not much unlike that of a moss Rose.

CONDITIONS OF SALE.

Goods are offered subject to being on hand on receipt of reply. Cash to accompany all orders, and prices to be strictly *nett*. All orders will be executed in rotation, and carefully packed and put on rail, except those otherwise stated.

P.O.O. payable at 794, Old Kent Road; Cheques crossed "L. and S. W. Bank."

GREENHOUSE DEPARTMENT.

THE AMATEUR FORCING HOUSE. TENANT'S FIXTURE (Span-roof).

These houses are offered at an exceedingly low rate, and should be readily approved by both amateur and professional gardeners, as brickwork, which is very expensive to a small house, is entirely dispensed with.

The utility of such a house for forcing or cultivating Cucumbers, Tomatoes, Melons, &c., will be perceived at a glance, it being a structure constantly in request but almost hitherto unknown.

Specification.—Framework substantially constructed of red deal; the whole of sides, and 2 ft. 6 in. of ends, boarded with well-seasoned tongued and grooved matchboards. Half-glass door, complete with rim lock and brass fittings, in one end; glass 16 oz. throughout, English cut. Ventilators supplied according to size of house, and stays necessary for opening same; stages for plants each side of house, all woodwork painted one coat of good oil paint, and the whole structure securely packed and placed on rail.

Lot.	Length.	Width.	Height.	Usual Price.	Sale Price.

SPAN-ROOF VILLA CONSERVATORIES.

Adaptable for the lawn of a villa residence, being well and substantially-built, constructed of the best materials, and artistically finished, with diagonal panels and barge-boards. The framework is composed of 2 in. by 3 1/2 in. red deal, the lower part doubly-lined with tongued and grooved matchboards, and the roof properly fitted with sashes, which facilitates fixing or removing of same without disturbing glass.

The houses are fitted with a half-glass door, complete with rim lock, brass fittings and key, and is supplied with lattice staging for each side, footpath the entire length; gutters, down pipes, suitable ventilators, and necessary ironwork for opening same. All woodwork painted two coats of good oil paint, glass cut to sizes, and all parts securely packed on rail. Prices:—

GARDENERS AND OTHERS WANTING SITUATIONS.

26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 5s. each insertion.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates is

THE "WORCESTER HERALD,"

ESTABLISHED 1794.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other property advertised in the columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let, would do well to advertise in the "WORCESTER HERALD," the leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation. Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

SHOPMAN (ASSISTANT).—Age 27, married; twelve years' first-class experience; good knowledge of nursery trade, also used to brisk Counter.—E. W., 50, Foregate street, Chester.

THE ENGLISH LANGUAGE is spoken by over one hundred millions of persons, sixty-nine millions speak German, over forty-one millions French, and thirty millions Italian. Spanish is understood by forty-one millions, and thirteen millions speak Portuguese, whilst Russian is understood by sixty-seven millions; thus, at least, three hundred and sixty-one millions of people are acquainted with the wonderful curative powers of Holloway's Pills and Ointment, as instructions for their use have been translated into the various languages named; in fact, they are known everywhere as the best medicines for all diseases. During the present cold weather they will be found invaluable for the prevention or cure of influenza, rheumatism, and all diseases of the throat and lungs.

THE IMPROVED GARDEN GULLY (VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Guttering, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are:—

8-in., 2s.; 10-in., 3s.; 12-in., 6s. 6d.

(The larger sizes are very strong for carriage drives.) Full Particulars and Testimonials on application.

VINCE & VINE,

THOMAS GREEN & SON, LTD.,

LEEDS and LONDON,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered

HOT-WATER BOILERS,

Others with TUBES, SHELVES, & HOLLOW or ORDINARY CAST-IRON GRATE BARS.

SADDLE BOILERS, With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant. The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the FIRST and HIGHEST PRIZE—a SILVER MEDAL—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

MUNICIPAL PATTERN BOILER, THE BEST EXTANT.

— FRONT ELEVATION —

— LONGITUDINAL SECTION —

— SECTIONAL PLAN —

The longitudinal section gives a view of the fire-box, water space, flues, &c. The front elevation shows it set in brickwork, which is necessary for this class of boiler. The cross section gives a view of the fire-box water space and V-shaped back.

"GARDENERS' CHRONICLE."

Continued Increase in the Circulation.

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

Increased to the extent of 75 per Cent.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

TECHNICAL HORTICULTURE. COUNTY COUNCIL LECTURES.

"PAXTON'S COTTAGERS' CALENDAR OF GARDEN OPERATIONS" will be useful to Lecturers and Students in the above subject. Price 3d.; post-free, 3½d. 41, Wellington Street, Strand, London, W.C.

H. CANNELL AND SONS' SEEDS.

Their Catalogue of the above will be sent post-free to all their friends and coming customers on application. Its value will surprise many, also the success of their Own Grown Seeds. It is a fact their superior quality increased our orders 2000 last season, absolutely proving they are better in every respect, and Five Silver Medals awarded at London Big Shows for Vegetables confirm it, and with their mode of business, is evidently highly appreciated all over the world.

FOR SALE.—OIL PAINTING, by E. Moira. Subject, "Camden Park, Chislehurst, 1860." The various changes which Camden Estate has undergone since 1860 render this work of unusual interest. Offers invited. Can be seen by arrangement.—G. E., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

SUTTON'S AMATEURS' GUIDE in HORTICULTURE for 1894 is now ready.

SUTTON'S AMATEURS' GUIDE in HORTICULTURE for 1894 is now ready.

SUTTON'S AMATEURS' GUIDE in HORTICULTURE for 1894 is now ready.

**NEW
CHRYSANTHEMUMS.**

We have great pleasure in announcing that we have acquired from Mr. T. H. Spaulding, New Jersey, U.S.A., the sole right of distributing his new set for 1894 in Europe. The plants arrived too late to produce exhibition blooms this season, and we were therefore unable to show them for Certificates, but the flowers we have had are wonderfully promising and fully bear out the raiser's descriptions. Mr. Spaulding tells us that this is the finest set he has ever sent out, which, coupled with his position as the first raiser in the States, will be ample proof of the value of these novelties. We have a good stock in hand, and shall therefore be able to supply strong healthy plants *struck cool*, which will bear full-sized blooms the first season. Catalogue containing these and the cream of all the other novelties, is now ready, free on application.

J. R. PEARSON & SONS,
CHILWELL NURSERIES, NOTTS.

THE COLORADO BLUE SPRUCE.

ABIES PUNGENS GLAUCA and ARGENTEA.

Handsome specimens, 3, 4, 5, and 6 feet high. These are all of the *Bluest* type, and undoubtedly the finest plants in commerce. *They are all Seedlings*, the plants usually met with being grafted on the Common Spruce Fir.

ROYAL SEED ESTABLISHMENT, CORPORATION STREET, MANCHESTER.

NEW CHRYSANTHEMUMS.

THREE GOOD and DISTINCT NOVELTIES, which should be in every Collection.

They have not been shown for Certificates, but may be depended upon as being acquisitions.

MISS SYLVIA SHEA.—Raised by C. E. Shea, Esq., from whom I have purchased the entire stock. From blooms I have seen I can assure my Patrons it is a really fine variety in every respect, being large, handsome, and distinct, very refined, of a pleasing colour. The raiser describes it as "of pure Japanese form and build, with the petals folding and interlacing with the utmost refinement and beauty of form, large in size, in colour a clear soft yellow merging into shades of rose and pink. I consider it the most beautiful and refined seedling that I have yet raised. Habit very dwarf, 3 feet." Plants, in March, 7s. 6d.; three for 18s. 6d.; six for 35s.

SOUV. DE MADAME BULLIER.—By far the best and most distinct dark variety, being superior to G. W. Childs and W. Seward, in fact must and will be accorded top position in this class. The blooms, which are blood-red in colour, without the buff reverse, are large, handsome, and last longer than any other crimson-red. Plants, 5s.; 3 for 12s. 6d.

LE M. L. DE BRUYN.—A vast improvement upon Sunflower. The blooms are large and refined, the petals being of a clear yellow, picotée, or edged with crimson in a most elegant manner. A decided acquisition. Plants, 5s.; three for 12s. 6d.

In addition to these, all other good varieties can be supplied, strong, healthy, country-grown plants or cuttings. See Catalogue, free.

N.B.—At the Grand Exhibition of the N.C.S., held in November last, I was awarded, in keen competition, all the principal prizes for New Japanese, in fact, the HIGHEST POSSIBLE award in each open class, and was awarded more Medals, Prizes, and Certificates for Japanese than any other Grower in the Kingdom.

SOMETHING ABOUT
NITROGEN.*

CHEMISTRY tells us that air is composed
mainly of two gases, nitrogen and oxygen.
Each of these, like the air which they together
make, is colourless and invisible. We cannot
see them, yet we feel them in every breeze, we
breathe them in every breath, without them we
should die. Air has weight. The atmosphere
presses down upon the earth with a force of
about 15 lb. per square inch, or nearly 5000
tons per acre. Four-fifths of this weight is
nitrogen and one-fifth oxygen. Over every
acre of land, then, there are nearly 4,000 tons of
nitrogen and 1,000 tons of oxygen. The oxygen
is the active, and the nitrogen the inactive
element of the air. To make a fire burn, we
provide a supply of air; it is the oxygen that
supports the combustion. Close the draft, and
as soon as the oxygen is used up, the fire goes
out. Nitrogen remains, but it cannot sustain
the flame. We breathe air to support life. In
an atmosphere of pure oxygen respiration would
be too active, but in one of pure nitrogen we
should suffocate.

WHERE NITROGEN IS FOUND.

Everywhere, then, where air is, there is nitro-
gen. Not only in the atmosphere as it surrounds
the whole earth, but in the waters of springs,
rivers, and the ocean, also in the soil which the
air permeates. But there is a great deal of nitro-
gen besides that in the air, for it forms a part of
every plant, from the grass to the Oak, and is in
every organ—in root, stem, leaf, flower, fruit,
and seed. It occurs in the body of every animal,
and in every part of the body. Neither plants
nor animals could exist without it. It is an
essential element of our food, and the costliest
component of fertilizers for our crops. It is pre-
sent in every fertile soil; indeed, no soil could be
fertile without nitrogen.

FREE AND COMBINED NITROGEN.

The nitrogen that makes up the bulk of the
air is in what chemists call the free state. The
atoms, as they are called, are not united to
those of any other element—they exist by
themselves; but they are capable of combining
with other elements to form compounds. Thus,
an atom of nitrogen unites with three atoms
of hydrogen to form a compound called ammonia;
and two atoms of nitrogen combine with five
atoms of oxygen to form a compound called
nitric acid. So long as the nitrogen remains
free, it can be used but very little, either by

* Abstract of a Lesson in Agricultural Chemistry, by Prof.
W. O. Atwater, of Middletown, Conn., U.S.A.

plants or animals, but in its compounds it can be directly used as a food and fertilizer; and the compounds of nitrogen are employed in a great variety of ways to supply the wants of man.

COMPOUNDS OF NITROGEN.

The nitrogen compounds that are of most importance in daily life, may be divided into three classes—ammonia, nitrates, and organic nitrogen:—

Ammonia.—This substance, like nitrogen, is a colourless, invisible gas. It is composed of two gases—nitrogen is one, the other is hydrogen—the gas which, combined with oxygen, forms water. Ammonia is formed when nitrogenous matters decay. We often detect a strong smell of it in the stable, and around the out-houses. We have it in concentrated forms in smelling salts, and in sulphate of ammonia, which is so much used as a fertilizer.

Nitrates—Nitric Acid.—It has been mentioned that two atoms of nitrogen may unite with five atoms of oxygen, and that the compound is called nitric acid. But the latest chemical theory requires that some water should be added to this to make the true nitric acid. If we take nitric acid and put soda with it, we get nitrate of soda. The substance under that name that is so much used as a fertilizer for our crops, is an impure material brought by thousands of tons from Peru and Chili. Ordinary saltpetre is a nitrate of potash, that is, it consists of nitric acid and potash. Nitric acid in the soil combines with lime, making nitrate of lime. In this form, nitrogen is very liable to be washed out of the soil by rain-water, and carried beyond the reach of the roots of the plants into drains and ditches. The loss of fertility which soils suffer by washing away of nitrates is incalculable.

Organic Nitrogen Compounds.—Nitrogen in ammonia, nitrates, and other forms, is gathered by plants from soil and air, and used by them as food. When it gets into the plants it undergoes wonderful changes. It combines with other elements, carbon, oxygen, hydrogen, and so on, and these compounds are stored away in the different parts of the plant.

Nitrogen of the Atmosphere.—We have already learned that four-fifths of the air is nitrogen in the free state. The atmosphere also contains combined nitrogen, ammonia, nitrates, &c., but the quantities are very small. Rain, snow, and dew, bring nitrogen compounds to the soil, but in quantities so minute as to do but little toward enriching it. That is to say, the amount of ammonia and nitrates brought to the soil in this way in a year would be about 7 lb. per acre. Some chemists hold that the free nitrogen of the air is assimilated by the soil, but this is doubtful.

The Nitrogen of the Soil.—The nitrogen of the soil comes partly from the atmosphere and partly from vegetation—that is, from plants which have grown and been left to decay in it. The soil contains very little ammonia or nitrates. Nearly all its nitrogen is in the more complex form of organic nitrogen. But the nitrogen in the soil is undergoing continual change. The organic nitrogen is altered, by "nitrification," to nitric acid, and this nitric acid, unless seized upon by plants, is sooner or later carried away by water, and lost to vegetation.

Nitrogen in Fertilizers.—Natural manures, dung, urine, &c., contain scarcely any nitric acid, and but very little ammonia. Nearly all the nitrogen is in the form of organic nitrogen. It occurs as organic nitrogen, likewise in most of the artificial manures, as bone, dried blood, fish-manure, leather-waste, and in the "ammoniated" phosphates, in which these are used to supply the nitrogen.

Peruvian guano contains considerable ammonia, but the larger part of the nitrogen is in organic compounds.

Indeed in all ordinary nitrogenous manures, except nitrate of soda and sulphate of ammonia, the bulk of the nitrogen is organic nitrogen.

WHAT FORMS OF NITROGEN DO PLANTS USE FOR FOOD.

Plants can take their nitrogen as ammonia, as nitric acid, and as organic nitrogen. They seem to

prefer nitrates and ammonia. The number of organic nitrogen compounds which they are able to digest, so to speak, is limited. Practically the larger part of the nitrogenous food of plants seems to consist of the nitric acid which their roots gather from the soil. This nitric acid is derived mostly from the decay of vegetable and animal remains in the soil, though part comes from the atmosphere in the forms of ammonia and nitric acid.

The inert nitrogen compounds, which, until changed, are useless to the plant, are gradually altered by the process of nitrification previously referred to, and finally reach the condition of nitric-nitrogen, which is the form most preferred by plants. And not only is the vegetable matter of the soil thus worked over for the use of plants, but animal refuse, dung, guano, and the various materials used for fertilisers, including even ammonia, are transformed by Nature in that wonderful laboratory which we call the soil, and converted into the compounds best fitted for the nourishment of the plant. *J. J. Willis, Harpenden.*

NEW OR NOTEWORTHY PLANTS.

GRADERIA SUBINTEGRA, Mast, sp. nov.*

For dried specimens of this very beautiful Scrophulariaceous perennial we are indebted to Mr. W. Nelson, the Nurseries, Booyens, Johannesburg. It is, says Mr. Nelson, "a very handsome and uncommon-looking plant—a trailer, herbaceous, three inches high, with Gloxinia-like pink flowers, with lighter shade in the interior of the flower."

The branches radiate from a woody stock, and trail on the ground; they are slender, coarsely hairy, somewhat woody. The alternate subsessile leaves are elliptic, acute, rather thick, about half inch long, a quarter of an inch broad, rounded at the base, with a prominent midrib and recurved margins, both midrib and margin covered with coarse, whitish hairs. The secondary nerves are obscure and pinnately disposed. The flowers are borne in erect leafy racemes, and are in shape something like those of a Gloxinia, but smaller, rosy lilac, with a lighter shade in the interior, and the veins netted and depressed. The illustration, fig. 122, and the details given in the footnote, obviate the necessity for any further technical description here.

For garden purposes this is likely to be a very desirable acquisition. It will probably require warm greenhouse treatment, but in the Riviera, as in many of our colonies, it would probably thrive well in the open. Seed may be had from Mr. Nelson.

* *Graderia subintegra*, Mast., sp. n. — Scrophulariaceae perennis herbacea piloso-scabrida, caule florifero 3—5 pollic. erecto ramoso, ramis sterilibus pluribus e rhizomate lignoso procumbentibus seu erecto-patentibus; foliis subsessilibus alternis seu suboppositis subcoriaceis 1—2 cent. long. 7—8 mill. lat., oblongis acutis basi rotundatis, integris raro parum pinnatifidis, nervo medio subtus prominente aequo ac marginibus revolutis piloso-scabridis, nervis secundariis obscuris; racemis erectis multifloris, pedunculis brevissimis alteris in axillis bractearam foliacearum solitariis; bracteis 2 lateralibus linearibus calycis tubo campanulato angulato approximatis eoque dimidio brevioribus; sepalis oblongis acutis 1-nerviis, nervis piloso-scabridis, tubum subaequantibus; corollae roseae circa 3 cent. long. calyceque duplo longioris tubo oblique ventricoso infundibulari, limbo subaequaliter 5-lobis, lobis rotundatis reticulatum nervosis nervis depressis; filamentis 4 longis pilosis tubo infra medium enascentibus inclusis, antheris bilocularibus, loculis subaequalibus apiculatis basi divergentibus; ovario gibboso glabro stylo filiformi exserto; fructu hard viso. *Graderia scabra* var. *subintegra*, Bolus and MacOwen MSS., in *Herb. Aust. Afric.*, n. 3090!

perennis, rami patuli prostrati ... G. SUBINTEGRA.
Folia subpinnatifidum nervia ple-
rumque lobata, rami erecti ... G. SCABRA.
M. T. M.

The plant is nearly allied to *G. scabra*, of the Cape Colony and Natal, and indeed dried specimens were distributed as a variety of that species by Messrs. Bolus & MacOwen; but the geographical distribution, the entirely different habit, the usually quite entire one-nerved leaves, the linear-oblong acute calyx-lobes, equal and glabrous anther lobes, serve to distinguish it. In drying, moreover, it turns of a black or very dark brown colour, which *G. scabra* does not do. A variety with narrow linear leaves also occurs near Barberton.

A third species, distinctly shrubby, with oblong-obovate leaves which turn black in drying, was discovered in Socotra by Prof. Bayley Balfour. *M. T. M.*

CYRIPEDIUM × MRS. TAUTZ, *gard. hybr.*

This is one of the most beautiful and striking-looking hybrids ever raised. Unfortunately, there is no record of its parentage, and although the flower embodies several good features of some favourite species, it is difficult to suggest its origin. I have showed the flower to several persons who make of the hybrid *Cyripedium* a special study, but beyond the confirmation of my statement that it is quite new and the best of its class, I have got no further help. To describe it, we must take the best form of *C. insigne* Chantinii, usually called *C. i. violaceopunctatum*, which is much superior to the original *C. i. Chantinii*. Imagine it increased in size, and of a thicker substance; let the broad white upper half of the dorsal sepal be decorated with many instead of few violet-purple blotches, and the surface of the lip and the broad villosum-like petals have a bright dark red-brown colouring, and the whole surface of the flower be very glossy, and an approximate idea of its beauty is obtained. The plant has broad green leaves, like those of *C. × Sallierii*; the stout scape is covered with purple hairs; the bract green, spotted with purple at the base; ovary green-coloured, sparsely covered with hairs of a purple colour; the upper sepal, which is over 2½ inches wide, is of an emerald-green tint at the base and spotted with purple; the upper half pure white, spotted, all but the broad margin, with violet-purple; the lower sepals are as long as the lip, greenish-white, with a few lines of purple dots; petals 1 inch broad, formed like those of *C. villosum*, yellow, tinged with dark red-brown; lip similarly coloured, and with a clear yellow margin; staminode large, light-yellow with a dark yellow boss in the centre. Some extraordinary forms of *C. insigne*, *C. villosum*, and *C. Boxalli*, are in the Tautz collection, and on one side or the other one of these may have been used, the other agent perhaps being a hybrid. The result is highly satisfactory. It is a pretty plant, and may well bear the name of the wife of the raiser, Fred. G. Tautz, Esq., Dibdin House, Ealing. *James O'Brien.*

LAVENDER CULTURE.

IN our issue of October 28, "H. C. P." asks if *Lavandula spica* is grown in large quantities in England for the manufacture of lavender-water? If so, where, and what are the conditions under which it is so cultivated?

There are two species of Lavender grown for commercial purposes, viz., the common Lavender (*Lavandula vera*), and the French Lavender (*L. spica*). The former yields the fragrant oil of lavender, used in perfumery (its solution in spirits of wine forming what is called lavender-water), and the latter, oil of spike, used by painters on porcelain, and in the preparation of varnish for artists.

Oil of spike is chiefly imported from the South of Europe, so we presume that "H. C. P." wishes for information respecting *L. vera* and not *L. spica*.

Lavandula vera is much cultivated at Mitcham, Surrey. The number of acres under the crop is said to be about 200. The soil most suitable for its growth is light and sandy, although it will flourish on a loamy clay. The plant is very subject to disease, and requires frequent renewing.

Rich dung or strong forcing manures are con-

sidered very injurious to Lavender, but we think a dressing of kainit-salt, sulphate of potash, or basic-slag, about 2 cwts. to the acre would prove beneficial, and assist in warding off disease. When a new plantation of Lavender is about to be made, a liberal application of dung is given to the land, and Potatoes are planted; the next autumn the Lavender

When the ground is ready, the new sets are prepared in the following manner:—The ground, being all lined out, the old plants are lifted up, and men are ready to pull or slip them, making as many plants out of the plantation that is being destroyed as they can; and the longer they are split down, with, if possible, roots to them, so much the better,

the best always. A plantation will last four or five years, much depending upon the general health of the plants. Nothing is done to the land after planting beyond an occasional hoeing to keep down the weeds.

An acre the second year is said to bring in £20 worth of Lavender. The expenses per acre are

FIG. 122.—GRADERIA SUBINTEGRA, GREENHOUSE PERENNIAL: FLOWERS ROSE-COLOURED. (SEE P. 798.)
 A, section through flower; B, floral leaf, bract, and calyx; C, ovary; D, cross-section of ovary; E, seed; F, stamen.

is put in. As soon as the crop of Potatoes is off, the whole of the ground is either dug or ploughed, and the deeper the better.

November is the proper time to plant the new crop. Sometimes the planting is performed in February or March, but it never does so well. Slips planted in November will make fresh shoots before Christmas. Diseased slips obviously should be avoided,

and this is mostly the case from the very nature of the original planting. When mere slips are employed, single ones are never put in, but generally three or four slips in each hole, the better to ensure success. They are set 6 inches deep, leaving about 3 inches above ground; the plants are set 2 feet apart each way.

The first year the new plantation will yield a few branches of blossoms. The second year is considered

estimated as follows:—Planting and cultivating, £3 10s.; cutting the blossoms, 7s.; distilling, about £1 10s.

The proper time to cut the Lavender for distillation is just when the lower blossoms are beginning to change colour to a darkish brown, and the sooner that, within a few days after cutting, it is distilled the better, as if left too long, the flowers would lose much of their odour by evaporation.

The blooming-spikes being cut down to the main plant, the blossoms and stems are all distilled together, and for the first run there is not allowed more than two hours; this is to get all the clearest and best oil, which should be nearly colourless. The second run is allowed four hours on account of the stalks, but this last distillation is generally of a pale amber tint, and is rather stronger and more coarse in its odour. *J. J. Willis, Harpenden.*

FOREIGN CORRESPONDENCE.

BERLIN LETTER.

THE late summer was an exceptional one, and it had an unusual influence upon vegetation. This was shown at one of the meetings of our Horticultural Society; specimens of Brussels Sprouts, densely set with sprouts, and also in full flower, were exhibited. This year has been one of the best fruit years for a long time; but the fruits are not keeping well, especially Peas. A good idea of the fruits of this year was given by the large fruit exhibition at Breslau. Seldom have there been so many well-grown fruits to be seen at once. Highly interesting was the exhibition arranged by the *Praktische Rathgeber*, a widely-distributed journal; each reader was allowed to send three specimens of three sorts of fruit which he thought to be the best in his county. About 250 readers sent fruits, which were arranged geographically, so that it could be easily seen which sorts are most grown in the different parts of Germany. The fruit exhibition at Berlin, some days afterwards, was also an interesting one, and included a collection from Russia. An exhibition of flowers has also been held at Berlin, where Chrysanthemums took the largest space. It is curious, though, that German gardeners cannot grow these anything like so well as in England. The cut flowers of Messrs. Reid & Bornemann, of London, which were the only ones sent from England, were far before all the others. Amongst our German collections, those of Mr. Spindler (head gardener, Weber) were the best; they contained some varieties of high value, directly imported from Japan. German gardeners take more interest in growing the plants into set forms; so the collection of Messrs. Fehmer & Sons, at Berlin, was much talked about. They exhibited, amongst other specimens, a fan of more than 2 metres high and broad, formed by one plant only, and carrying hundreds of pale rose-coloured large flowers. Another specimen was formed like a round table, of 1 metre high and 2 metres in diameter; the tabletop was formed by thousands of white flowers.

Better than the Chrysanthemums were the other flowering plants, especially the Carnations, Picotees, and Cyclamens. There were good collections of zonal Pelargoniums to be seen. Of Orchids there were some large collections, especially one of *Cypripedium* from Mr. Larkner, Steglitz, who exhibited specimens of more than a metre in diameter with a great many flowers. A very fine plant is the *Fuchsia triphylla*, of which we saw a nice specimen with a stem of about 1 metre high, and a crown of the same diameter full of flowers. *Cuphea platycentra* was exhibited, grown in the same manner. *Medeola asparagoides* is much liked here, and fine specimens are often seen in the florists' shops. This plant, so much grown in the United States of North America, is especially adapted for sprays, button-holes, &c. The imports of cut flowers from Italy this year is enormous, and, of course, the prices are very low. One hundred Safrano Roses, for instance, are sold for 2½d. Notwithstanding, our gardeners force Roses, and get good prices. It may interest you to know that we had this year forced Roses blooming on November 10, whilst in other years the first appeared about Christmas. At that same time Roses were still in flower here in the open air, and the best Roses we have had this year was in October. The disease, has destroyed large quantities. It is a bacterium which attacks the twigs and leaves, and kills the plants in a short time. Another disease which destroys a great many plants

is the *Diplosis oculiperda*, the larva of a little fly which kills the buds. Your Berlin cotemporary, the *Gartenflora* will be changed in character in the next year. The *Verein zur Beförderung des Gartenbaues in Den Kgl. Preussischen Staaten* will publish this famous old journal at its own expense. The coloured plates will cease to appear, the number of sheets will be reduced, and the proceedings of the Society will be published in the *Gartenflora*. So only the title of the old journal will remain.

EARLY AND MAIN CROP PEAS.

THE past season will long be remembered for its bright sunshine, and as regards mid-season Peas, as a very trying one; particularly was such the case in gardens where the soil is light and sandy, or where the supply of water was not sufficient. I think it may be of use, therefore, if gardeners will state in the *Gard. Chron.* the nature of the soil they have, and also the sorts of Peas that have given the best returns from the end of May to October. For my part, I do not grow Peas of the round or smooth type, as such sorts do not find favour, although where the soil is heavy, and the locality late, such sorts stand rough weather better than the Marrows.

I am much pleased with Veitch's Chelsea Gem for first early. This is a very early hardy Pea, as well as being a very heavy cropper. I gathered this variety in May last from seed sown in small pots in December, and planted out January 2, when only 2 inches high, as I believe Peas do not like to be checked in any way. These Peas grew 2 feet high, and the crop they yielded was excellent. I know that usually Chelsea Gem only grows 1 foot high, but if it have good ground, it will grow 2 feet and more in height, and be all the better. Duke of Albany, one of the grandest Peas ever sent out, was my second early, and treated in the same way as to sowing and planting as the Gem, it was ready at the end of May, and was truly a grand Pea, the crop being very heavy, and of the best quality when cooked. Some gardeners object to this Pea because it grows too high; but where sticks can be had, I very much prefer main-crop Peas from 4 to 5 feet high, and during the wet seasons of 1891 and 1892 Duke of Albany was over 6 feet high. On our sandy soil many good dwarf Peas, such as Veitch's Perfection and Sturdy, in hot dry seasons, do not pay for growing, becoming a prey to mildew, and the pods not coming to perfection. In many places sticks cannot be had for tall Peas, and as no kind of Pea will bear topping, the dwarf kinds of Peas are of great service; but for hot dry weather, select a Pea of not less than 4 feet. In regard to topping Peas, I would mention that eight years ago, during my first season here, the pheasants picked all the tops off my early Peas much neater than I or any man could have done it, and the Peas were ruined. The Peas were just over a foot in height when the pheasants topped them; since that time I have always had to protect by wire all my Peas and other vegetables except Celery.

Ne Plus Ultra was always a great favourite of mine, but in dry weather on our sand it soon gets blighted, and I only sowed two rows this season alongside Autocrat, a Pea that like Duke of Albany, is all that can be desired. The Ne Plus Ultra was soon blighted and very badly mildewed, but Autocrat was as green as Leeks, and was splendid right up to October, withstanding the drought even better than Duke of Albany. I must here state that Autocrat is a very strong grower, and sown in company with Duke of Albany was two weeks later, but as a main crop Pea it is a fine sort, and in future I shall sow it largely. Many gardeners prefer to sow their first early Peas in pots, and afterwards place them in cold pits or frames. This plan saves much trouble, but in any case I have no room to spare for pot Peas, and unless they are planted-out after they are some 2 inches high, they receive a check and never attain to perfection, for to have good heavy crops of Peas the bine should never feel a check. This season my Duke of Albany never showed a flower until they

were over 3 feet high; I have now 154 yards of Peas just showing through the ground, they were sown on November 15 on a south border, and which will get no protection in any way, except guards and wire-netting to keep off pheasants and water-bene, and all being well, these Peas will be in pod early in May next. The sorts sown are Chelsea Gem, Exonian, and Duke of Albany. *W. C. Leach, Albury Park Gardens.*

ORCHID NOTES AND GLEANINGS.

MASDEVALLIA TOVARENSIS.

AMONGST the many fine things to be seen, at various times of the year, in the gardens of Woodhatch Lodge, Reigate, mention should be made of the plants of *Masdevallia tovarensis*, which at the present time form a remarkable display; and this is possibly the more striking as these plants are arranged in a double line, running the full length of the house, and it is the first house of the Orchid-range which is entered. The plants, about twenty in number, are grown in 7-inch pots, and possess on an average twenty-five spikes on a plant, and from four to five flowers on a spike. Mr. C. J. Salter, the gardener at Woodhatch, is to be congratulated upon his great success with this species. *H. B.*

THE TREATMENT OF SOUVENIR DE LA MALMAISON CARNATION.

THE fine blooms of the above variety are much appreciated at any time, but most in the winter season. As a button-hole flower with garnishing of their own leaves, or the Old Clove Carnation, nothing can be nicer. The flowers are equally fitting for furnishing small vases, one or more flowers being placed in each vase.

In the middle of the month of August, 1892, a friend who grew this Carnation extensively in his then place, kindly sent me a few old plants, which, together with a few plants which I already possessed, I at once planted in a west border, and then layered every available shoot into prepared soil. The layers rooted uniformly well, and towards the end of September 350 of them were potted into 3 inch and 4½-inch well-drained pots, sound fibrous loam being used as potting soil, which was made firm about the roots.

The plants, after being watered, were stood near to the glass on a bed of coal-ashes in a cold pit. Here they were slightly shaded when necessary for a few days, i.e., until the new roots were made, when the pit was freely ventilated on all favourable opportunities, and the ashes drawn off for a few hours on most fine days. About the middle of the month of November the plants were shifted into 5½-inch and 7-inch pots, employing the same kind of loam as before, only this time it was in a rougher state, and placing the plants as they were potted into our first house, at a fair distance apart, on a stage that runs along the middle of the house. Here the plants had full light, and air in abundance; they were not too far from the roof. The soil having sufficient moisture, water was not afforded the plants for three or four days after the potting, and great care was afterwards taken in the watering. The ventilation at the top of this house was seldom stopped during the winter, and the pipes were made warm to prevent the temperature at any time falling below 32°. The plants made a sturdy growth, and required to be repotted in February. A month or six weeks later, the Figs requiring a higher temperature than I considered would be good for the Carnations, the latter were transferred to some new cool pits facing south, and the pots stood on sitted coal-ashes, over which some soot was strewed to deter worms. Waterings of diluted liquid-manure and weak soot-water were afforded the plants as soon as the soil became partly filled with the roots, the plants being syringed overhead on the afternoons of warm days, the ashes made damp between the pots. The plants produced one large flower each on the

central stem during the months of May, June, and July, and these same plants have been yielding a number of large blooms during the last two or three months, and seem likely to flower till spring. As soon as the weather this last autumn became too cold for the development of the flowers in the Fig-house above-mentioned, the most forward plants were put into an intermediate-house, in which a minimum temperature of 55° to 63° is kept up for Tuberoses, so treated the plants are opening their flowers in a most satisfactory manner. I need hardly say that the flower-buds have been kept well thinned, one only being left on the top of each shoot, and as fresh flower-buds form very quickly on strong plants, the superfluous buds should be taken off every week. The young plants of this year's layering are now at the cool end of the Fig-house, and the successional flowering ones at the warmer end. I contemplate planting these early in summer, and layering the shoots at that time. In this way I think good plants for flowering the following winter might be obtained. Over care of the plants, and not treating them as hardy plants should be treated, cause more failures to grow and flower this variety satisfactorily than all other causes put together. I have frequently syringed the plants overhead with soot-water after the sun has gone off them in the afternoon during the summer months, with a view to keeping the plants free from insect attacks as much as applying it as a fertilising agent, with satisfactory results. *H. W. Ward, Longford Castle Gardens.*

SCOTLAND.

PERTSHIRE NOTES.

WHEN one is travelling in counties which are proverbial for a cold climate, and where the conditions are not conducive to high-class gardening, it is always a matter worthy of notice, when things generally found in the garden are fine in quality and abundantly produced. Sometimes it will occur that these productions can hold their own with the best in the sunny South. It is not merely to culture under glass that I make reference, as that is as well done in many of the coldest districts of Scotland as anywhere else; but to hardy fruits and vegetables, which are cultivated in the open, with the best results. It might be imagined that the past season has had all to do with it, but where success has been visible year by year for a good part of a lifetime, surely the skill of the cultivator has had much to do with such uniform success, although climate and soil do often get the credit which is due to the gardener. It is well known that in some districts of Scotland, which are now among the healthiest in the country for man, at one time little in the way of animal life was to be seen except wild fowl; draining and deep tillage have worked wonders in rendering them fit for human occupation. Rainfall, when in superabundance, has often the blame of much that is untoward in agriculture and horticulture. It is known that some of the best fruits and vegetables seen in the North, are produced where the greatest amount of rain falls. It is evident when cultivators have a fair opportunity of turning their knowledge and experience to good account, that in the course of time they are able to overcome many difficulties. In Perthshire many examples of high-class culture may be found, which are simply due to the gardener's labours during many years, and where the gardeners have been encouraged by their employers to devote their energies to the work. In Perthshire, for example, where the majority of the gardeners spend the greater part of their lives in one situation, they accomplish much which would not be the case were they under employers whose caprice is always prompting them to find the men they are never likely to get. It is well known that many of the finest places in the kingdom are suffering by the continual changes which proprietors so injudiciously make. In Scottish establishments generally this is uncommon. In Perthshire the gardeners in the leading places at present are old in service, hale and hearty, and they have served their employers well for many years. Among a number of places, I called at Abercainey, near Crieff, where the veteran Brown is as full of energy and enthusiasm as he ever was; after managing his place well for more than

forty years. He keeps himself well up to date by competing, by reading (he told me that he had read the *Gardeners' Chronicle*, for forty-four years), and visiting exhibitions worthy of notice. Hence it is not to be wondered at that we see in the Valley of Strathearn, at a place without climatic advantages, produce equal to any in the country, and which has so often carried off highest honours in hard contests at exhibitions many miles distance from each other. Apples, Peare, Plums, Apricots, Cherries, Peaches, and Strawberries may be seen in these gardens in large quantity, and of the finest quality. The past season having been one of the best for outdoor crops, those at Abercainey could not well have been much finer. Fruit trees are neither too large nor too dwarf; Magnum Bonum, Victoria, Coe's Golden Drop, and Kirke's, among Plums, were first-rate. Pyramid trees, and those trained on the walls are kept thin, so as to get the wood and fruit well exposed to the sun and air, which has much to do with success in fruit-growing. Among examples of good culture in Apples, Lord Burleigh, Emperor Alexander, Stirling Castle, D. T. Fish, James Greive, New Hawthornden, Beauty of Bath, and White Worcestershire Pearmain were equal to the best which I have seen in the county from which the last-named variety takes its name.

Strawberry culture has for many years been a specialty at Abercainey. The ground is prepared for these fruits by deep trenching, manuring, and by being made firm before planting. The rows are 3 feet apart each way, and the plants remain for three years in bearing; but long before that time the stools have met, and although each stool retains its individuality, the space is fully occupied, and yet there is no crowding.

Turning from fruits to vegetables, we find the latter receive the highest cultural attention, and well they repay the skill and labour expended on them. Whilst every part is closely cropped, the object is to obtain fine quality and sturdy growth rather than mere size, although there is also size where it is profitable to have it, as instanced by the Onion crop. Cranston's Excelsior, a variety much grown for general use and competition in the North, yielded a handsome lot, and finely prepared for keeping, many weighed 1½ lb., while none was under 1½ lb.

Carrots at one time almost defied cultivation at Abercainey, but for many years the crops have been all that could be wished. The vexatious Carrot-grub is now not found, although the crops are grown on the same ground year by year. In the spacious range of glass, Peaches, Nectarines, and Grapes have long been well managed. The Peach and Nectarine trees are trained crosswise from back to front of the houses, which is certainly a method which gives quantity and good quality at Abercainey. Lady Downes' Seedling is the favourite late-keeping Grape. Still, others are well represented. Abercainey Seedling, *syn.* West's St. Peters, is quite different at the place at which it originated than anywhere else. This (now old) Grape was raised by Mr. James Arnot, the predecessor of Mr. Brown, who for thirty-five years managed the gardens with much skill. This place was also the home of the Messrs. McIntosh, Mr. James McIntosh (the father of Charles and James, jun.), who was widely known in his time. His son Charles was the author of the *Book of the Garden*, and gardener at Dalkeith Palace for many years, while James was gardener at Drumlanrig Castle for a long period, and these were names which were long familiar in Scotland. Mr. Brown occupies the picturesque cottage where these worthies were reared. This interesting structure has a beauty of its own, standing in pleasant surroundings of trees, shrubs, and lawns, a picture which would be interesting to many were it figured in the *Gardeners' Chronicle*. [We hope to insert it in our pages shortly. ED.]

There is a great deal to interest a gardener at this splendid seat, and it teems with objects of beauty, such as the spacious park, with its numerous gigantic trees, many of which were blown down last November; the fine lake, long drive, beautiful lawns, the Conifers, and the flower-gardens—managed by the son of Mr. Brown, whose taste for high keeping of the ornamental department is very marked. The flower-garden, enclosed by a fence, is of French design, and is kept very gay with the usual flowering plants which are well suited to the district. Begonias are high in favour. There are besides these, terraces, a bowling-green, and long lines of choice shrubs, in which sculpture is suitably placed. Borders of herbaceous perennials are among

the more striking features of the garden. The fine mansion stands in a commanding position, and has few equals in Perthshire. All the buildings on the place are built with great good taste; the stables, at a distance, resemble a spacious castle. The plant-houses are placed near to the flower-garden, and they are kept well furnished with stove plants in variety suitable for house decoration. Greenhouse plants, such as Camellias, Azaleas, &c., are grown largely to meet the requirements of the family. Captain Murray, like numbers of his ancestors, is held in much esteem in the county, and his urbanity and kindness of heart are likely to keep up the good name of the family. *M. Temple.*

WEST INDIES.

ROSES IN THE TROPICS.

(Concluded from p. 776.)

Two excellent Roses, but not vigorous flowers, although not delicate in constitution, are:—

Souv. de la Malmaison and Souv. de Paul Nees. I have before me as I write a Malmaison bloom, which would not discredit a stand in the Crystal Palace, and a host of buds of Paul Nees, with which the most fastidious could find no fault; both of these are most profuse flowerers all the year round. Two lovely but delicate-constitutioned Roses are Marie and Pierre Guillot. Maréchal Niel and Gloire de Dijon, do fairly well here, but do not produce such flowers as we see in Europe.

The following list of Tea-roses are all profuse flowerers, the first twelve particularly so, flowering year in and year out, are all good vigorous growers, easy to manage, and easy to propagate. They are placed in their order according to merit.

Profuse-flowering roses:—

1. Etoile de Lyon, fine saffron-yellow; producing large quantities of splendid buds, most of which develop into large full Roses of perfect form, but at times from some cause as yet unexplained, the buds instead of developing turn black and fall off.
2. Madame Jos. Swartz, white, exquisitely tinted with rose, good buds which always develop into fairly good blooms.
3. Perfection de Monplaisir, beautiful canary-yellow, of medium size, full good form.
4. Mad. Cecile Berthod, deep sulphur-yellow, the backs of the petals almost white.
5. Caroline Kuster, changing from yellow to salmon-pink, a real gem.
6. Madame Camille.
7. Coquette des Blanches, one of the best whites, although occasionally the tips of the petals are tinted with pink.
8. Solfaterre, great for buds.
9. Madame Bravy.
10. Siffrano.
11. Madame De Natus.
12. Bougère.
13. Jules Finger.
14. Count Lavergrie.
15. Devoniensis.
16. Celine Forestier.
17. Doucher.
18. Jean Pernet.
19. Camille Koch, pure white, very fine.
20. Dr. Berthet.
21. Lamarque.
22. Cheshunt hybrid.

The following Roses are vigorous growers, and flower freely about March or April, according to the advent of the spring rains:—

1. Earl of Pembroke.
2. John Hopper.
3. Souvenir de Madame Hélicart, a lovely Rose.
4. Jean Cherpis.
5. Queen of Queens.
6. Rosey Moru.
7. Countess of Oxford.
8. Duke of Edinburgh.
9. General Jacqueminot.

I have seen glorious plants of Cloth of Gold and Perle des Jardins at an elevation of 5000 feet, but have never seen good plants on the plains, so cannot say if they are suited to truly tropical situations.

I am now carrying out experiments in budding different Roses, which are hard to propagate by cuttings, on to various other easily-grown Roses, also on a wild Rose found on the hills (*Rosa laevigata*), and shall be pleased to inform you as to results for the benefit of your readers in other parts of the much-abandoned tropics. *Wm. Cradwick, Superintendent, Hope Botanic Gardens, Kingston, Jamaica.*

CHISWICK NOTES.

VARIEGATED IVIES.—The large collection of Ivies in the Chiswick gardens is interesting for the number of good variegated varieties it contains. I carefully went through the collection recently, and noted a few of the finest variegated kinds. Usually the one selected for planting in gardens is *Hedera Helix madeirensis variegata* [?], but this is too tender, except for warm positions, and the leafage gets burnt in hot summers. The best one to which I have seen this put is as an edging in Messrs. C. Lee & Son's nursery at Isleworth. *H. H. algeriensis variegata* is a good kind, the leaves of distinct shape and glaucous in colour, margined with creamy-white. *H. H. marginata purpurea* is robust and handsome, the leaves of various shades of green in the centre and creamy-white at the margin; the growth is dense and even, and the variegation decided. A very bright kind is *H. H. aurea elegantissima*, in which the broad margin of the leaf is creamy-yellow; this is one of the finest of all variegated Ivies, strong in growth, and no bare patches are left. *H. H. marginata elegantissima* is a very close-growing Ivy, the leaves with a creamy-white margin, and produce a dense covering to the wall. Another good form is *H. H. elegantissima marginata grandis*, a name that requires considerable simplification; the leaves are broad and distinctly variegated, green with a margin of white.

A very beautiful Ivy in winter is *H. H. atropurpurea*, also in the Chiswick collection; the plant makes a quick, dense, and even growth, the leaves rich chocolate-purple in colour, varying little in shade. I do not often see this variety in gardens, but it is well worth growing for the rich colour of the leaves in winter; throughout the year they preserve this distinct character. *V.*

BRICKLEHAMPTON HALL.

BRICKLEHAMPTON HALL, the country residence of R. Hinshaw, Esq., is situated about 4 miles from Evesham, and the same distance from Pershore. I had the privilege of going through these well-kept gardens a short time ago, when I was much struck with the fine condition of the plants of Bouvardia, Solanum, and Begonia. The Bouvardias, which were chiefly the single white-flowered variety, were grown in pots from 10 to 12 inches in diameter, were 2 feet high, and as much in diameter, and so full of their heads of flower that I could not put my finger between them without touching. Mr. Lott, the gardener, cuts his plants well in when they have done blooming, and places them in such a position that they will break freely, a free growth is encouraged, at all times keeping them near the glass, and giving them plenty of air. As growth advances the points of the shoots are pinched out, in order to prevent the plants from growing too tall and straggling, and to encourage bushiness. By the beginning of the month of May the plants are placed in cold frames, and as the days get warmer, more and more air is afforded them, until by the third week of the month they are thoroughly inured to the external conditions, when they are taken out of the pots, some of the soil removed from the balls, and planted out in an open position in the garden. Here they make a firm

robust growth, with short-jointed wood, and a profusion of shoots capable of carrying thousands of flowers. All the care necessary during their probation in the kitchen garden, is to keep the ground clean, and afford the plants water occasionally in dry weather. By the first week in September they are taken up, and potted in 10 and 12-inch pots, a good compost of turfy loam, with the addition of a little leaf-mould, some very rotten manure and sand being made use of. The plants are then placed in a shady situation in the open air, syringed overhead occasionally to prevent the leaves from flagging, and by the end of the month removed to the conservatory. At the time of my visit (October) the plants were smothered with thousands of their pure white, fragrant flowers.

The Solanums were equally well done, only they were crowded with bright red berries instead of flowers. These go through a similar course of treatment to that pursued with the Bouvardias. When the plants begin to decline in beauty towards spring, they are well cut in and afterwards kept in a rather close position to encourage them to break freely. They are afterwards kept in a cool temperature and gradually hardened until they can be safely turned out of their pots and planted in the open ground in the kitchen garden.

About the first week in September they are taken up and potted in 8 or 10 inch pots, and kept in the shade for a few days, when they are ready to do duty in the conservatory. Here they make grand ornaments, for they were in the highest state of health and luxuriance, about 20 inches high and as much through, and covered with hundreds of their bright red berries. The Solanums were a sight to see, not merely one or two solitary plants, but a large batch, and every plant perfect.

The Begonia plants were very good ones, and as I enquired of Mr. Lott what kind of treatment they received, I could not discover any special system of culture that had been adopted, except unremitting attention to matters of detail, and well-directed skill brought to bear on their culture. The plants were full of vigour, loaded with gorgeous flowers, while the seedlings of the present year were grown into handsome specimens. *Quintin Read.*

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By BAILEY WADDS, Gardener, Birdsall Gardens, York.

EXOTIC FERNERY.—Some care will now be required to make this department attractive, and a change should frequently be made in the arrangement of the plants so as to give freshness. *Adiantum Farleyense*, *A. Williamsi*, *A. gracillima*, *Davallia elegans*, *D. Mooreana*, *Gymnogramma chrysophylla*, *G. peruviana*, *Platycerium alcornianum majus*, *P. grande*, *Pteris argyrea*, *P. cretica alba lineata*, *P. tricolor*, *P. serrulata cristata*, *Woodwardia radicans*, and other good winter decorative Ferns should be placed where their beauty may be seen. Remove decayed fronds and give careful attention to watering; syringing may be dispensed with unless in the case of rustic walls, pillars, or arbours, in which Ferns and Lycopodiums are planted which will require a thorough watering about once a week—this and other watering should now be done early in the day. Where much cutting of *Adiantum canescens* is required, the plants are better when grown in 6 or 8-inch pots, cutting the whole of the fronds of a pot or pots as wanted, old and young fronds together, the cut-over plants being then placed out of the way, and kept rather dry until required for starting in the spring. This plan keeps the specimens in better condition. A temperature of about 55° by night, 55° to 65° by day, will be sufficient at this season, a strong heat in the hotwater-pipes being avoided, and the floors should be covered with coarse sand or fine gravel, and should not be swept with a brush. Air should be afforded when possible. Baskets of Ferns will need careful watering before they get dry; and hardy Ferns be kept as cool as possible, but frost excluded, and not much water afforded them. Deciduous Ferns stowed away under staging will keep in good condition if laid on their sides till starting time in the spring if the house is a cool one.

LILIUM AURATUM, L. HARRISI, L. CANDIDUM.—Batches of these Lilies that were potted early may be pushed on in the forcing-house, encouraging them with waterings of liquid-manure, and keeping them clean from green-fly. A succession of crowns of Lily of the Valley should be introduced every ten days. The principal stock of named Hyacinths, Tulips, Narcissus, Jonquils, and other bulbs for early spring display should now be occupying a good position where their wants can be attended to at all times, and where they can obtain light and air to keep them strong and healthy; they must not be allowed to get dry at any time, and manure-watering will do them good.

LACHENALIA TRICOLOR AND ANEMONE JAPONICA should be elevated on pots to keep them from being drawn, and great care must be taken with the watering. Hellebores and Christmas Roses, potted and placed in a warm house at the beginning of the month, are now a mass of flowers, which will last a long time if taken to a cool house. Cyclamen will require careful watering now, but do not water over the crowns, and they will be benefited by some good hand-manure being afforded. When gathering the flower pull them out—do not cut them; the plants like a little shade when the sun is bright, and a free circulation of air during mild weather; a temperature of about 50° by night and 55° to 60° by day is suitable to those that are in flower.

CINERARIAS will now be coming into bloom, and may be afforded weekly waterings of clear root-water, and abundance of air when mild. They also like a little shade from bright sunshine, and a span-roofed house suits them best at this season. Keep them clean from aphid, and free from mildew.

BOUVARDIAS are flowering strongly, and for a long time this season; large plants that were grown outside and potted up in September have given abundance of good flowers, and have been standing in a temperature of about 45° by night and 50° to 55° by day; they keep clean and give better flowers in colour and texture when not given much fire-heat. They require a little more care in watering when standing in a cool-house.

ZONAL PELARGONIUMS.—To keep up a succession of flowers these require moving on in batches, and they require a temperature of 55° to 60° by night, 65° to 70° by day, with a good circulation of air to keep the blooms dry. Remove decayed leaves and flowers, and water sparingly. For winter-flowering scarlet varieties grow John Gibbons, E. V. Raspail, and Henri Jacoby.

CHRYSANTHEMUMS.—Two very pretty useful varieties, that keep their foliage well, and are useful for flowering in masses on untrained plants late in the season, are *Roseum superbum*, Japanese, and the single beautifully sweet-scented variety, *Mrs. Langtry*, silvery-rose colour; both of them are very beautiful at the present time.

THE HARDY FRUIT GARDEN.

By T. TUTTON, Gardener, Maiden Erlegh, Reading.

ORCHARD TREES.—The cold weather usually experienced at this season, which makes the operations among the fruit trees in the kitchen-garden unpleasant, may be taken advantage of to examine and carry out what is necessary among orchard trees. Any old trees which may have been neglected as regards the thinning of the branches and the preserving of an open crown, may first be taken in hand, thinning-out branches where they are crowded, but preserving the symmetry of the trees. Young trees which may have fruited well should also have their branches thinned out a little, and in such a way that sunlight is freely admitted to all parts. Trees of a pendulous habit should be encouraged to ascend by pruning back growths intended for the leading branches, at the point where they begin to bend over. That fine orchard variety *B. abant Bellefleur*, requires special attention in this respect whilst it is young; the long and slender branches being more disposed to spread out horizontally, or bend downwards than ascend. Thin out any branches which chafe others, and trees of a straggling habit like Peasgood's Nonsuch should have the longest, or all the branches, if necessary shortened back a good distance, thus encouraging a compact head, which will prevent the fruit from being whipped and damaged by wind. Worthless sorts of Apples or Pears, if the trees are aged, I prefer sawing the heads off now, the trees being allowed to break into growth; and this is thinned in the summer to the proper number to form a head,

and these branches are whip-grafted the following spring. In the case of younger trees, the sawing-off of the head should be left till grafting-time.

CANKER.—In Apple trees that are old, not much can be done to arrest canker beyond the top-dressing the roots as recommended in a recent Calendar; and the trees cleared of branches that have died from this malady. Where the disease has started in orchards of younger trees, the cankered parts should be scraped clean and cut down to the sound healthy wood, and dressed with Gishurst compound-soap at the rate of 4 oz. to one gallon of water, and clay to bring it to the consistency of paint, and sufficient soot to darken the colour, using a stubby painter's brush. The Gishurst will kill the insects which may have escaped the scraping out, and deter others from harbouring in the damaged parts.

AMERICAN BLIGHT.—Where trees are infested with this pest, no pains should be spared in trying to exterminate it, or they will soon be ruined in health. The past summer seemed specially favourable to its spreading. The best means to employ against the blight are those that contain petroleum or Gishurst compound-soap at the rate of 4 oz. to the gallon of water, to which half a wineglass of petroleum is added, the whole to be kept well mixed together.

THE KITCHEN GARDEN.

By H. C. PRINSEP, Gardener, Buxted Park, Uckfield.

POTATOS.—It will soon be advisable to plant these more extensively where heated pits are available, so that they may be ready for table early, in order that the pits may be planted with Melons and Cucumbers. If the beds are made up of fermenting material, avoid too high a temperature to begin with, as it has a tendency to cause weakly growth. Batches of sets should be placed in a warm house to encourage them to sprout, which will save a week or more. Earth-up any that are sufficiently advanced, choosing fine days for the work if the lights have to be removed during the process. If this be previously warmed at the time of planting to the same temperature which the Potato sets have been growing, it will prevent any check in growth.

CAULIFLOWERS.—A pinch of seed of Early Forcing may now be sown, to produce plants for growing in frames. When the seedlings appear above the soil, keep them exposed to light as much as possible, to prevent them damping. Any in the open ground ready for use should be lifted and taken to the vegetable-house, and those not so advanced should be stored in a cold pit, if there be any signs of severe weather. Such varieties as Snow's Vanguard and Autumn Mammoth should receive special care.

CARROTS.—During the late mild weather Carrots on hot-beds made good progress; another sowing should now be made, to keep up a succession. Any that were sown in the open borders in the autumn should have a little litter thrown over them, should the frost be severe; and any Turnips that are in the open ground will be the better for a little protection during severe weather.

SEAKALE roots must be placed in heat to keep up a supply, but do not make too large batches, as this is a vegetable that must be used as soon as ready.

SALADS.—Mustard and Cress will now be in great demand, so that frequent sowing should be made. A few days will suffice to bring it forward if placed in heat. The soil should be changed for each sowing, however, otherwise it will not grow satisfactorily. Continue to blanch Endive, Dandelion, Chicory, and Lettuce. The latter has been exceptionally good lately from the open ground.

GENERAL WORK.—All that can be done outside to keep the place tidy, such as removing decaying vegetable, &c., should be done. Keep all small growing crops free from any accumulation of leaves brought there by rough winds, and if there be any need for protection, see that it is given in the most efficient manner. The receipt of the seedsman's catalogues reminds us that it is time to prepare for the ensuing season, and that those who have time should prepare their orders, and send them in early.

FRUITS UNDER GLASS.

By M. TEMPLE, Gardener, Carron House, Falkirk, N.B.

PINES.—Where adequate means exist to supply Pines in succession for the table all the year, the present is a suitable season to re-arrange the plants

which are to fruit during May and June; and if tanner's bark or the leaves of Oak and Beech are to be used for bottom-heat, these materials should be placed in a fermenting heap, and be kept in a dry state ready for use. The old fermenting material should be removed well from the sides, in order to admit of a good addition of new material, which should be thoroughly mixed with such of the old as is retained. New tan will often heat very intensely, so that it is a matter of necessity to lift the pots on to the surface of the bed to prevent burning the roots; and as all sudden extremes of temperature are harmful, this is a matter of great importance. Plants showing fruit should be placed by themselves, and those which are to start during the present month should be arranged by themselves apart from the rest. The temperature of this division may range by artificial heat from 65° to 75°, with a fall of 5° during very severe weather, and a rise of 10° with sunheat. The atmosphere of the house should be kept in a moist state by sprinkling walls, floors, and the plunging material, but never applying so much moisture as to cause drip from the roof. Succession plants may remain at a temperature of 55° to 60°, giving air always at the apex of the lights whenever it may be safely admitted.

VINES.—All Vines should now be cleared of their crop of fruit, which should be bottled and stored in the grape-room. Keep this room dry, and avoid cold draughts, as these cause shrivelling, and light removes the colour from black Grapes, so the room should be darkened. The pruning should be finished as soon as possible after cutting the crop, the woodwork and glass washed, and the surfaces of the borders renewed as formerly advised, maintaining the vineries cool and dry. Where two or three vineries exist, the present time is generally preferred for starting the earliest one, and the outside border should be protected, for which there is nothing better than glass placed over dry litter. House-tiles are sometimes used as protection with good results. If the Vines are young, and they have not been previously forced, forcing ought to be slow at the first; whereas Vines which have been often forced early may be started at 50° at night, with a rise to 60° with sunheat. Let the water which is used for syringing the Vines always be warmer than the air of theinery. Vines started in the month of November, if showing the bunches, should be examined, the best-placed bunches being retained, that is, those that are near to the rods, as these are the more compact and best formed. Disbudding should have early attention, and in doing this, one shoot should be left on each spur, unless the latter be long, and then one close to the rod may be left, which will form the new spur another year. The strength of the Vines should always be considered when deciding on the weight of the crop to be taken, the weight of the bunches, as well as their number, being taken into account. The stopping of the shoots need not be done hurriedly or severely, and two or three leaves beyond the bunch is close enough at the first operation, and afterwards the shoots may be stopped at one leaf, but carefully avoiding all crowding of foliage. The temperature may rise from 60° to 65° with fire-heat, sun-heat being utilised by closing theinery early in the afternoon. Syringing may cease, or at least it should not be done too often, a moist but not stagnant atmosphere being maintained.

POT VINES.—These will require special care in the matter of affording water at the roots, the avoidance of crowding of the shoots and leaves, and ventilation when the Vines are flowering. The use of a camel's-hair pencil about mid-day will be useful.

PEACHES.—Just before the blossoms begin to open let the house be fumigated two nights in succession, and do not use the syringe while the fruit is setting. Afford air early in the day.

THE FLOWER GARDEN.

By T. H. CRASP.

HELLEBORUS NIGER (THE CHRISTMAS ROSE).—The flowers of this plant will now be emerging from the soil, and a handglass or a cloche may be placed over them. It is well to make preparations soon for the potting-up of Pelargoniums and other bedding plants, first forming a list of those which are needed, and the number; and if the stock of them is insufficient to meet requirements, propagation may commence at the turn of the year. The Pelargonium cuttings are usually the first that are taken, after the plants have been long enough in gentle warmth to induce growth in small degree. The cuttings

may be dibbled into well-drained pots, pans, or shallow boxes of light sandy soil, and after affording them a watering with a fine rose water-pot, they may be placed in a forcing-house or propagating-pit. The cuttings of *Lobelia erinus* varieties, *Ageratum*, *Heliotrope*, *Iresine*, &c., may be struck in a similar manner, only with the addition of a half-inch layer of sharp sand on the surface of the soil; but there is plenty of time yet for these easily-rooted plants.

FUCHSIAS, which are coming largely into use as summer bedders, may have, if a further stock of plants be required, a few of the plants kept over from the autumn placed in heat after slightly pruning them by cutting off the extreme tips of shoots, and thinning out the weakest wood, picking up the crust of soil and thoroughly watering them. Syringe them every day—twice or thrice if the day is sunny, and when new shoots two or three joints long are made, cuttings may be taken. Insert these after proper trimming, in boxes or pans, and place in bottom heat of 80° in a dung-bed frame, or a bed of leaves in a forcing-house or other place sufficiently warm and moist. When placed in any place other than a close frame, a glass covering is needed. Flower seeds of last season may now be cleaned, and many articles needed in the flower garden got in readiness, such as sticks and stakes, labels, layering pegs, &c.

THE ORCHID HOUSES.

By W. HOLMES, Gardener, Pickering Lodge, Timperley.

The year 1893 has been remarkable, and one which will not be readily forgotten by Orchid growers, as we have been favoured with much better weather than we are accustomed to. From the commencement of February we had an abnormal amount of sunshine, greatly favourable to Orchid cultivation, and very little fire-heat was needed until a few weeks since, besides which we have been able to admit abundance of fresh air in all the divisions. The coming season should be attended with an abundance of flowers, especially on such as *Cattleyas* and *Dendrobiums*, the pseudobulbs of these being so well-matured. During the last two months we have had very little frost here, and I may say no fogs at all such as we usually have often had to contend with during November. The *Laelias*, *Calanthes*, and *Phalænopsis* are all looking well, and the collections of *Odontoglossum crispum* are looking better than they have done at any time during my charge here, and they will flower much earlier, the spikes are stronger and have more substance in the flowers. This I account for by the extra early ripening of the new pseudobulbs. I may say, our *Odontoglossum*-houses are due south, so they have had the full benefit of all the sunshine, and to my mind they like this, providing that damping and shading be carried out thoughtfully. *Phalænopsis amabilis*, *P. grandiflora*, *P. Schilleriana*, and others grown in the same house, have also done remarkably well, and could we only have the summers or seasons such as this has been, no doubt we might run our Belgian friends a very close race. The early-flowering *Cattleya Trianae*, should have the benefit of the lightest part of the *Cattleya*-house, and, along with *C. Percivaliana*, be placed in the warmer end, kept a little warmer than the rest, the flowers come much freer, and open with more substance. *Lelia purpurata* will be finishing up their new pseudobulbs, but must not be dried too suddenly; some may be later in finishing, and must have attention paid to them to induce them to finish up as early as possible so as to give them a good rest. *Cattleya Warneri*, if placed at the cooler part of the house, as advised in a previous Calendar, and water withheld, will now be starting into new growth, and may be given 5° more warmth, so as to encourage the new breaks to come away freely. This plant does best in a teakwood basket hung close up to the roof-glass, and as they are taken down to start, should be well soaked with water; being a mass of roots and dry peat—an ordinary watering will not penetrate it. *C. maxima* will also be on the move, and may be placed alongside the *C. Warneri*. *C. Mossiae* and *C. Mendeli* should by this be fully made up and at rest; very little water will be needed for these at present. *Phalænopsis amabilis*, *P. grandiflora*, *P. Schilleriana* should now be kept very quiet, and only sufficient water and heat to keep the sphagnum green, with as much bottom ventilation as is safe to give. The temperature should be at the lowest at the present time. The earliest started *Dendrobiums* will now require more water, as the flower-buds will soon expand, and the new growths are growing freely.

EDITORIAL NOTICES.

Local News.—Correspondents will greatly oblige by sending *be the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Newspapers.—Correspondents sending newspapers should to *careful to mark the paragraphs they wish the Editor to see.*

Advertisements should be sent to the PUBLISHER.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—36°.7.

NOT many years can show so well-filled a record in matters horticultural as that which is now at its very last ebb. It has been more than usually a busy one. "Events" have not only been numerous—they have been important, and the net result is decidedly to be summed up in the word "progress." In so saying we are alluding to horticulture generally, not to the commercial side of it in particular, as that, important as it is, is after all, only an "incident!" First of all—English fashion—we must speak of the weather. Let the scoffers laugh, what topic interests the gardener more than the weather? And, again, we may ask, how many of the present race of gardeners can recall such a season as that which we have passed through in 1893, and how many are likely to do so again? February was a wet month, but from March till July sunlight and temperature were vouchsafed to us to an extent beyond the experience of the present generation, and with scarcely a drop of rain; and the meteorological conditions went on in this fashion, only slightly modified, throughout August, September, and part of October. Stimulated by the unaccustomed warmth, excited by the unwonted light, plants rushed into bloom prematurely. May was as July. Two crops of Apples were not uncommon on certain trees, and one instance, at least, came under our notice where a third generation of Apple blossom appeared. A second flower of a Narcissus was sent us from a bulb which had flowered in the ordinary course, and several similar cases were recorded. Two crops of Strawberries were common, and a similar redundancy was observed in places in Peas and in Potatos. The season was eminently favourable to the fruit crops, at least so far as quality is concerned, Apples and Pears being unusually fine, though many, especially Pears, ripened out of their normal season. Some things that rarely flowered at all luxuriated in this season; but for others the conditions were as decidedly unfavourable. It was a valuable lesson as to the effects of climate on vegetation. Some one will, we hope, gather the scattered records together and publish them for the benefit of posterity. Perhaps the Roses showed the effect of the season as much as any one class of plants. At any rate, the Rose shows were much below the average. Apprehension was felt as to the result on the Chrysanthemums; but singularly to relate, the Queen of Autumn held her court at the usual time and with more than usual brilliancy. The disbudding may have accounted for this preservation of the usual rhythm.

As to the other principal shows of the season,

the Temple Show and the great Orchid show at Manchester were highly successful, though we greatly missed the elegant grouping of continental displays, and which seems to be unattainable here. As for new plants, in one sense the most interesting of all, we look for them more particularly at the fortnightly meetings of the Royal Horticultural Society. There would be little means of examining them if they were exhibited amid the crush and turmoil of a "big show." Unfortunately, little encouragement is given to "New Plants" now-a-days, and a "Botanical Certificate," which should be the highest award, is looked on as of very low estate. That is taking a merely mercantile view of the case, a view appropriate in a sale-room or a business establishment, but out of place when, as at the Royal Horticultural Society's exhibitions, they should be judged on their intrinsic merits not on their conventional value.

The fortnightly shows at the Drill Hall retain their popularity with exhibitors to such an extent that on some occasions the space, considerable as it is, is insufficient. The show of the Society at the Agricultural Hall was an interesting experiment, but the results, we fear, were not encouraging. As a show it was excellent and varied. Moreover, some attempts were made at more artistic arrangements, sufficient to show that the repulsive formality of the average Rose show, for instance, is by no means an absolute necessity. There was ample evidence at the shows this season that exhibitors of Carnations, Dahlias, Pansies, and Chrysanthemums, are at last beginning to find out that if they want to show their flowers to the best advantage, they must not throttle them with card-board collars, nor flatten them down on boards till they look like paving-stones in a side-walk.

The opposite extreme was exemplified in the donkey-decorating, car-adorning procedures of a society which in this particular does not act up to its lofty title. Were such things practised as part of the show at Earl's Court or the Crystal Palace, they would be not inappropriate. It is alleged by some that pure horticulture does not pay, so that some adventitious excrescence of this kind is supposed to be necessary to fill the coffers. This may be the case in some village festival; but on the other hand, the experience at Earl's Court this year and last, as at South Kensington in years happily past, show that horticulture is squeezed out, and goes to the wall when allied to other more highly spiced forms of entertainment. Indeed, horticulture at such places is tolerated only as a "side show," and looked on by exhibitors as chiefly a means of getting money.

Before leaving the subject of shows, we must make passing allusion to the great World's Fair at Chicago. We believe we are not overstating the case when we say that so far as the horticultural department was concerned this was, barring a few exceptional exhibits, such as the Cannas, a failure. There were abundant reasons for this, some of which were foreseen, and, in any case, it adds another illustration to our contention that horticulture, as such, stands a bad chance as one element in a variety show.

As a striking instance to the contrary, and as an illustration of how proudly horticulture can hold its own when not weighted down by other things, we may allude to the Quinquennial celebration at Ghent which was held in the spring. This show was larger than ever, the grouping admirable, the interest more varied, and the attendance of notabilities from all parts of the world larger than usual. Unfortunately,

the political unrest of Belgium at the time interfered somewhat with the success of the Exhibition, and added a terrible weight of care, and an irksome amount of labour to the already overtaxed officials. It is hard enough work to organise and manage a great exhibition of this kind, but when military duties and night patrols were superadded, it may readily be conceived how great the strain was—and yet from the officials themselves not a murmur was heard; their work was done as thoroughly as if it had been effected under ordinary conditions, and the genial hospitality and courtesy to strangers were as remarkable as ever. One public reception, however, at the Town Hall had to be abandoned, because the Municipal buildings were, for the time, devoted to less peaceful ceremonies.

A large contingent of English horticulturists, headed by the President of the Royal Horticultural Society, visited Ghent on this occasion, and for their benefit we organised a series of articles on some of the principal of the 200 nurseries round Ghent as well as on some of those in Brussels and Bruges. This originated a discussion which is even now not terminated, as to the relative merits of British and Belgian cultivation especially of Orchids. As to general principles, there is, of course, no difference; in the matter of details there are differences attributable, as we believe, mainly to diversities of climate.

Early in the year an agitation was instituted against the excessive and disproportionate charges made by the Railway Companies for the conveyance of goods, especially of farm and garden produce. The case was proved up to the hilt, the charges made by the Railway Companies were shown to be arbitrary, capricious, and well calculated to destroy the only branch of agriculture which has been conducted to a prosperous issue in this country of late years. It was shown that the cost of conveying goods of this character from Kentish orchards to London and Manchester, and other towns, was more—not in proportion, but absolutely greater than the charges made for conveying the same class of goods from Boulogne to Folkestone, and then to London, over the same line of railway! Nay, even agricultural seeds from Chicago could be sent over here, a distance of 4000 miles, cheaper than they could be sent from Liverpool to London. All this, and much more to the same effect, was told to the President of the Board of Trade by a joint deputation of the Covent Garden salesmen and the growers for market. As the facts are of the greatest importance, we may refer the reader to our issue of March 4 for a plain statement of the facts of the case.

The extraordinary character of these statements elicited on this occasion came as a surprise even to some who fancied themselves generally familiar with the extent to which market gardening had developed of late years. The figures made public were so large that we were convinced that the horticultural fraternity, to say nothing of the general public, had no adequate idea of the commercial importance of this great industry, nor of its rapid development during the last few years, precisely at the time when the agricultural industry of the country has been at its lowest. For these reasons we despatched a representative to visit several of the leading market gardens in the vicinity of London, as illustrations of the whole. His reports were published in our columns in the spring, and constitute a body of evidence plainly confirmatory of what was said at the Board of Trade, and strikingly illustrative of the immense

FIG. 123.—*LÆLIA FINCKENIANA*: FLOWERS WHITE, LIP MARKED WITH ROSEY-PURPLE. SEE P. 506.)

importance to the country of this branch of commercial enterprise. When, in addition, we take note of the capital involved in the ordinary business of the nursery and seedsmen of the kingdom, we shall have an aggregate to show that horticulture takes, not as most people fancy, a relatively unimportant position among the commercial enterprises of the kingdom, but a very high one.

The extension of horticulture affords one powerful reason for the development of what is called technical education. The County Councils have recognised this, and practical lectures and demonstrations are now, for the second season, in progress in the rural districts. No practical art can be effectively taught save in a practical manner. Lectures and demonstrations, nevertheless, may be very serviceable in diffusing knowledge, exciting attention, and enabling the hearers to teach themselves by practice and observation. They are a means of affording information to a class of persons who would otherwise be unable to obtain it, a class to whom books and papers are relatively useless. But it is not to such lectures and demonstrations that we must look for progress. That can only be expected as the result of a thorough grounding in the principles combined with adequate training in the practice.

If we are to confine ourselves simply to teaching handicraft, we shall merely increase the number of average practitioners, of whom there are too many already; there will be a larger number of workmen but no increase of knowledge, and consequently no increase of work. The present race of practitioners cannot, so far as mere handicraft goes, hope to do more than equal their forefathers; any progress that may be made must depend upon the better appliances at their disposal, and upon increased knowledge. Hence, whilst the County Council lectures are doing good service in their way, something more is required, which is only to be got at in well-organised schools and colleges, where knowledge is imparted as well as manual dexterity acquired. In the meantime, who is to teach the teachers? It is certain that not everyone is a born-teacher: the best practical gardener may be very inefficient as an instructor of others. To meet this difficulty, the Essex County Council have instituted classes for teachers, classes in which the general principles underlying successful cultivation are thoroughly instilled to begin with. Even if nothing else be done, this may be expected to obviate many a mistake, prevent much loss of time, and much needless expenditure of money. Edinburgh, too, is turning her splendid opportunities to account in educational directions. In this connection the visit of the Scottish Arboricultural Society to Windsor and the New Forest may be noted as one of the prominent events of the year.

A sense of the necessity for a knowledge of general principles is, indeed, gaining ground, and it affords proof of the statement with which we set out that we are progressing. Compare the books and journals of to-day with their predecessors even ten years ago, and it will be at once obvious how much more attention is given to the diffusion of knowledge of principles. People are beginning to find out that "Science" and "Theory" are not necessarily or entirely abstract ideas, but that they are to a large extent synonymous with knowledge that may be turned to practical ends. Tell a would-be gardener he requires to know something of science, and that theory may be of service to him, in spite of the old adage about the ounce of practice outweighing the ton of theory, and he will not appreciate

what you say. Tell him it is desirable he should acquire knowledge, and he will at once assent to the proposition!

Of books and memoirs marking progress in horticulture we may mention as having been published within the year, the first volume of the *Kew Index*, to which we have alluded so recently, that we need not here occupy space with further reference to it. Another book of reference for all time is *Sargent's Silva of North America*, of which a fifth volume has lately been published. Of memoirs we may make passing allusion to the excellent piece of work on Town Fog effected by Professor F. Oliver under the auspices of the Scientific Committee, and published in the *Journal of the Royal Horticultural Society*. In France, M. Georges Truffaut has added much to our knowledge of the chemical nature of the soils in which plants are generally cultivated, and as his researches are founded on practical experiment in the plant-houses as well as in the laboratory, it is certain that much benefit will accrue therefrom to practical horticulture.

On the other side of the Atlantic, Dr. MACFARLANE is prosecuting his researches on the minute anatomy of hybrids. These were begun in Edinburgh, and the results have been published in the *Transactions of the Royal Society* of that city. Dr. MACFARLANE'S researches (see our issue for January 7, p. 16) have been made on garden plants of much interest, so that their practical value is also beyond dispute.

The Rothamsted papers on Wheat culture and those connected with the Jubilee of that Institution, though not horticultural, are, nevertheless, full of instruction for the thoughtful cultivator. In connection with the Jubilee, a knighthood was conferred on Dr. GILBERT. His claims to honour are acknowledged on every hand and in every country; but there is grotesque inappropriateness in the fact that the same award is made to a man like Sir JOSEPH GILBERT, and to a man whose only claim to distinction is his wealth, to a city magnate, or to a party politician whose title to recognition is the amount of money spent in the service of his party. Party gratitude is one thing. National recognition is, or should be, quite another. We do not wish to disparage either, but the distinction between the two should be drawn.

The gardening charities, it is said, are doing fairly well, but when approved candidates very largely outnumber those who can be elected, we cannot but feel that the gardeners of the country do not support the committees of the several institutions as energetically as they might do, that they trust too much to the liberality of outsiders, and do not take a fair share of the work and responsibilities which now devolve on a few.

The death-roll has this year been large, and its importance to horticulture is not to be measured in numbers only. Among our own contributors we have lost the great botanist, ALPHONSE DE CANDOLLE; and WESTWOOD, the celebrated entomologist, one of our very early contributors. The death of Professor BENTLEY, so long known in connection with the "Botanic," is announced as this sheet is passing through the press. LANTON, DODWELL, C. VERLIER, and GUILLOT represent a class of raisers to whom horticultural progress owes not a little. ERNST BENARY is a name known and respected throughout the commercial world. CHANTIN, of Paris, JOHN WATERER, and HUGH LOW were hardly less widely known. SAMUEL BARLOW

was an enthusiastic gardener and one beloved of many. But we need not prolong the list. Whilst we mourn, we rejoice that they were privileged to do so much; whilst we remember them with gratitude, may we look forward hopefully to the future. Incited by their example, may we each in our way "Follow Light, and do the Right."

OUR ALMANACK.—Secretaries of Societies and others, are earnestly requested to forward *immediately*, the dates of Show Fixtures and Meetings of Botanical and Horticultural Societies of any kind for 1894, for insertion in the Almanack, to be published in our issue for January 6.

LÆLIA × FINCKENIANA.—Our illustration (fig. 123, p. 805), gives a representation of the beautiful natural hybrid *Lælia*, first flowered by C. W. FINCKEN, Esq., of Hoyland Hall, Barosley (gardener, Mr. J. MILBURN), and described in the *Gardeners' Chronicle*, February 18, 1893, p. 194. It was again exhibited at the Royal Horticultural Society before the Orchid Committee on December 12 last, when it was awarded a First-class Certificate. The flowers have some resemblance to those of *Lælia anceps* Dawsoni, but are smaller, and it will be seen that the form of the labellum is quite different from that of the same organ in any variety of *Lælia anceps*. The plant itself would easily pass, when not in flower, for *Lælia autumnalis* alba, or a strong form of *Lælia albida*; and one or other of those species, with a white form of *L. anceps*, it is suggested, has taken part in its production. The flowers are pure white, the base of the lip having some purple lines extending half-way up the side-lobes, with three yellow ridges extending towards the front, and a crescent-shaped rosy-purple colouring on the front lobe, which has a broad white margin.

THE CLIMATE OF THE NORTH COAST OF WALES.—Mr. A. O. WALKER in an address to the Chester Natural History Society, in which he compares the climate of the Welsh coast near Llandudno with that of Greenwich, sums up by saying that it is hotter in summer and colder in winter near London, whilst the rainfall is greater on the Welsh coast. Near London the average rainfall is 23.3 inches whilst at Llandudno it is 30.7 inches. At Colwyn Bay the rainfall is given as 31.10 inches on an average, whilst in the neighbouring mountains 124 and 138 inches have been measured. As to the economical effects of the difference between the south-east of England and North Wales and Cheshire districts, Mr. WALKER says:—

"Agriculturally, this difference means that the former is a Wheat country and the latter a dairy and stock-breeding country. And this again means that in the former the competition of the cheap land of America, and the cheap labour of India, has ruined farmers, impoverished landlords and clergymen, and thrown thousands of acres of land (temporarily at least) out of cultivation, with all the concomitant distress to other classes implied by these conditions. In the latter, the distress has been comparatively trifling, and that, I think I may venture to say, in direct proportion to the amount of atmospheric humidity. Here, too, the insect pests that cause serious injury to farmers and gardeners, and to the south-east, are comparatively innocuous. Again, the same comparative immunity (compared with our southern neighbours) extends to gardeners. In Cheshire, certainly, the Gooseberry sawfly is often a pest, but I have never seen it at Colwyn Bay. In the south the havoc wrought among fruit trees by the larva of the November moth was very serious in 1890—has any gardener here ever suffered seriously from it? In short, I cannot name a single insect that does serious damage to farm or garden crop on our North Wales coast! But, on the other hand, we miss those additional degrees of solar heat to ripen both the wood and the fruit of our Pears and Apples, and it is vain to expect either the quantity or quality of fruit that the Kentish gardener grows. But much may be done by the choice of sunny sites and by modes of training trees, so as to give wood and fruit the greatest possible exposure to the sun; and the greater freedom from severe spring frosts is in our favour. On the whole, we of the north-west have reason to be thankful for our moist atmosphere."

M. BURVENICH.—For thirty-five years this gentleman has been employed in doing work in Belgium of a character analogous to that inaugurated

here only last year under the auspices of the County Councils! The Belgian Government has awarded to M. BURVENICH the civil cross of the first class in acknowledgment of his labours, and some of his old pupils and friends propose to offer him some testimony of the value they put upon his services, and of their respect for his character. The subscription is limited to 50 centimes, so that there should be a large response.

"THE JOURNAL DES ORCHIDÉES," whose approaching suspension was announced some time since, will, we learn, not suffer that fate, but will continue to appear regularly.

MAPLES.—FRITZ GRAF VON SCHWERIN has published separately his essay on the "Species and Varieties of the genus *Acer*," which originally appeared in the *Gartenflora*. The Count describes no fewer than 105 species, many of them with numerous varieties. Outline figures of the leaves are given.

FLOWERS FOR SENATORS.—The practice of sending flowers to the Senate on the opening-day is increasing each year. On Monday last there were few desks which were not covered with some kind of floral remembrance. Senator VOORHEES was the recipient of a mammoth horseshoe of Meteor Roses; Senator TURPIE came in for an open book of the same flowers; Senators HANSBROUGH, DOLPH, HARRIS, and VANCE were to be seen carrying out large handsome baskets of La France and Kaiserin. Senator STEWART'S desk was covered with a piece which caused some merriment among the senators—it was in the shape of an obelisk made of red and white Roses; on one side were three large white *Chrysanthemums*, and on the other were three equally large yellow ones; this reference to the monetary situation brought smiles to the faces of Senator STEWART'S neighbours, who, in turn, went over to get a snuff at what they termed his "bimetallic bouquet." *Florists' Exchange, Washington.*

ARSENITES AS INSECTICIDES.—"The value to this country of arsenical poisons for the protection of crops against insect injuries can hardly be over-estimated. Arsenic in its various combinations is the great panacea for all the evils inflicted on man by leaf-eating vermin. Through its use the value of our annual food supply is increased by many millions of dollars," so says Mr. GILLETTE in the current number of *Insect Life*. In this country we are extremely chary of trying experiments or even of adopting processes when their value has been proved. In this case the reluctance to adopt the method is naturally enhanced by the risk of accidental poisoning. It will not do to entrust such dangerous substances to an ordinary labourer.

BISULPHIDE OF CARBON.—We need to hear much of this as a cure for Phylloxera, and it is certainly an excellent insecticide. For destroying insects which attack herbaria, furs, or woollen garments, it is well suited. The articles are placed in a chest lined with zinc and the lid of which fits into a groove filled with water, so that the chest shall be as nearly air-tight as possible. The packets of plants or other articles to be rid of insects are merely placed in the chest together with the bisulphide, the latter fluid being contained in zinc vessels 10 cent. long, 6 cm. wide, and 9 cm. deep, and the plants are allowed to remain four or five days, by which time the fluid will have evaporated, and killed every insect; even the eggs are not safe against the destroyer. No injury is done to the plants or furs, and the disagreeable odour soon passes off. One caution must be given—to keep the bisulphide out of reach of fire or candle, as the vapour is very inflammable. The operations should, therefore, be carried out in a room or shed to which neither light nor fire has access. M. ALPHONSE DE CANDOLLE first called our attention to the matter, which is the subject of a note in the current number of *Insect Life*.

RAINFALL AND LEAF FORM.—Some interesting observations, which have been carried on at the

mountain station of the botanic garden at Buitenzorg, Batavia, by Professor STAHL of Java, are published in the *Botanische Zeitung* for May 10. The station is about 4,500 feet above sea-level on a part of the volcanic gerdch in Java. No one who has seen the suddenness with which rain falls in the tropics, and is disposed of by the luxuriant foliage of a hillside, can fail to be interested in this investigation. Some of the adaptations are among the most curious in the whole range of vegetable forms, especially those which are connected with the rapid drying of the leaf itself in a comparatively moist atmosphere. "Ingenious devices appear to be adapted" by tropical plants to protect themselves from the very heavy blows from raindrops in the tropics. This observation opens out an endless vista for speculation, and perhaps for research.

HOLLYHOCK FUNGUS.—Hollyhock growers will remember the disastrous effects of this fungus a few years since. After decimating the Hollyhock it disappeared, or, at any rate, ceased to inflict much damage. It must not, however, be thought that the enemy is annihilated. Lately, at Folkestone, where *Malva sylvestris* is common in the greensand undercliff, about one plant in every twenty was infested with the fungus, and perishing in consequence. It was curious to see how individual plants in a patch were affected, leaving the neighbouring plants apparently and perhaps only temporarily intact. At any rate, this attack on isolated specimens at once suggested that if they were taken up and burnt immediately the mischief was observed, that the disease would not spread. *Lavatera arborea*, the Tree Mallow, which also flourishes in the locality, probably as an escape from cultivation, does not appear to be affected with the fungus. Sulphide of potassium in solution would probably be effectual in checking the progress of the fungus.

INFLUENCE OF EXTERNAL CONDITIONS ON THE FLOWERING OF PLANTS.—The conditions which promote flowering are not necessarily dependent upon light; this is not essential to the development of the blossom, though it is so to the capacity of the plant to produce flowers, as it has a tendency to promote the formation of reproductive rather than of vegetative shoots. As a rule, the brighter the light the deeper the colour of the bloom; the ultra-violet rays are the most efficient for this purpose. With many plants, an alternation of high and low temperatures, involving a period of rest in winter, is favourable to flowering. Dryness, both in the air and in the soil, is, as a rule, favourable to the production of flowers, for when a plant has an abundant supply of nutriment, this goes to the formation of vegetative organs. Dr. F. BENECKE is responsible for these conclusions, and he gives some interesting illustrations in the *Biol. Centralblatt*, xii., pp. 699 and 673.

NOTABLE GARDENS.—Earl COWPER'S Derbyshire seat, Melbourne House, famous by reason of its Dutch gardens, is, it is stated, to be let for a term of years. The gardens of OCKWELL'S Manor House, near Bray, are not likely to lose in repute under their new owner, Mr. E. W. BARRY, a son of Mr. F. T. BARRY, M.P. for Windsor. Mr. BARRY, Jun., is a gentleman of refined taste, and will doubtless see that the grounds of the historic seat he has just purchased are all that the grounds of such a place should be. A mansion in the grounds, of which the horticulturist will have scope, is that now being built on an extensive scale for Mr. GURNEY at Chalfont St. Giles.

LECTURES ON HORTICULTURE IN NORTHUMBERLAND.—A successful course of lectures, under the auspices of the County Council, has lately been concluded. The places chosen for the purpose, six in number, were at widely separate places in the county, e.g., Bamburgh, Horsley-on-Tyne, Blanchland, &c. The instruction afforded was thoroughly practical in its bearing, and framed with a view of deepening the interest of the people in gardening, and providing information on such subjects as the pruning, grafting, and general management of fruit

trees and bushes, treatment of the soil, and destruction of insect pests. These subjects were admirably illustrated by means of diagrams, the magic-lantern, chemical apparatus, and specimens of plants. Advice was also given out-of-doors where practicable. Much interest was manifested in these lectures, and the average attendance very good. *The Newcastle Daily Journal* makes the following comment:—"In the lecturer, Mr. JAMES WILSON, jun., F.R.H.S., St. Andrews, the committee has chosen a man who combines theory and practice in such a way as to be able to overcome the prejudice which exists in many against the introduction of science into such a subject."

"THE VINE AND ITS CULTURE."—M. ED. PYNÆRT has published a French translation of Mr. BARRON'S much-appreciated volume on *Vines and Vine Culture*. Belgium is not a wine-producing country, and its climate presents little advantage over our own, unless it may be in some parts a higher summer temperature and a clearer atmosphere. The cultural methods, therefore, suitable for the one country are for the most part equally applicable to the other. Large vineries have been erected near Brussels, and elsewhere, for the supply of the Belgian towns, whilst the needs of Paris and the omnivorous maw of monster London have offered temptations to the grower to compete on the one hand with his French neighbours, on the other with those who supply our own market. The French, with their dislike of free-trade, have placed great obstacles in the way in the shape of heavy duties, whilst we fear the very low price obtained for Grapes in this country can hardly have proved very remunerative to the grower. This season good Grapes have been quoted, exceptionally no doubt, at as low a price as 4*l.* and 6*l.* a pound. Those, too, who see the enormous quantities put upon the London market from the Channel Islands may feel some doubt as to whether Belgium can advantageously enter our markets. But Belgium is enterprising and persevering, she is thrifty and intelligent, and these qualities will undoubtedly prove valuable aids to her in her endeavour to get a share in the supply of Grapes and other fruits to London. A translation of Mr. BARRON'S book by so competent a hand as M. PYNÆRT is likely to prove very serviceable. Here, we know the merit of the book, and we venture to think it will not be long before our Belgian neighbours appreciate it also. M. HOSTE, Rue des Champs, Ghent, is the publisher.

DEDICATIONS.—Some idea of the progress of garden botany and of the work of its promoters, may be gleaned from the dedications of the annual volumes of the *Botanical Magazine*. This year the volume is dedicated to Mr. HANBURY of La Mortola, as a tribute to the value of his services to scientific horticulture in creating a garden of exotic plants at [near] Mentone, which in point of richness and interest has no rival amongst the private collections of living plants in the world; and in munificently founding the Istituto Hanbury in the Botanic Gardens of the University of Genoa, the early years of which are already so full of promise for the future of scientific botany in Europe.

A GOOD EXAMPLE.—The travelling public has often had to thank the Midland Railway Company for leading the way in matters affecting our comforts and purses. It has lately reminded horticulturists of its desire to encourage their art, and that by awarding £150 in prizes to its station-masters for the best-kept platform, flower-garden, and borders. Its custom in this direction is an annual one. The highest prize has this year been secured by the stationmaster at Matlock Bath, Derbyshire.

THE PACKING OF FRUIT.—On the 2nd inst., Mr. T. H. RIDING, F.R.H.S., delivered a lecture on "Small Bush and Berry Fruits." Very properly, as we think, he directed considerable attention to the packing of fruits for market. We were recently talking to a butterman. "My Irish butter," quoth he, "is better and cheaper than that I get from

Normandy; but the ladies say the Irish is dirty and slovenly packed, and will insist on having the daintily-packed produce of the French dairies." Our children could surely be taught to pack the choice sorts of fruit in a manner that would charm the eye of the fastidious, and so give to English goods the same fascination as the more artistically packed, but not better fruits of other countries exercise over the minds of people.

THE "JOURNAL OF UNIVERSAL INFORMATION," edited by M. EDWARD CURTICE, and published by ROMEIKE & CURTICE, is a novelty in the journalistic world, since it is type-written instead of printed. The result is a few (six) loose pages in a green cover. The contents include general news, chit-chat, and notices of current magazines. The fact that it is type-written may interest those specially interested in that process, and bring it more into use and favour for some purposes; but from the standpoint of the general reader this journal is neither so legible nor so sightly as a printed paper.

RECREATION-GROUND AT FULHAM.—The new grounds abutting on the Embankment, recently completed at Fulham, together with a meadow on the west side of the Bishop's residence, called the Bishop's Meadow, were on Friday, the 22nd inst., opened to the public by Mr. HUTTON, Vice-chairman of the London County Council. The meadow will remain simply as a playground, but the land lying between the moat and the river-wall is laid out in an ornate manner with broad expanses of turf (not yet laid), beds and borders of evergreen trees and shrubs, and as a means of masking the stagnant water of the moat, a raised bank of soil skirts its margin, and this, although rather narrow and steep, will, when the deciduous and flowering shrubs and half-trees with which it is planted have grown up, effectually serve its purpose, whilst preserving the charming prospect of the Palace grounds. There is one feature of the planting which will, we hope, be condemned, that of a narrow border skirting the river promenade. This border, only about 15 inches wide, is planted with dwarf evergreen shrubs in some variety, but owing to its proximity to the path, and its accessibility, the shrubs cannot possibly succeed unless secured by means of wire netting. Taken as a whole, it is one of the prettiest gardens which has yet been laid by the London County Council.

PUBLICATIONS RECEIVED.—*The Uchuba, or Vegetable Tallow* (produced in the State of Pará, from a variety of *Myristica sebifera*)—*List of Seeds of Hardy Herbaceous Plants, and of Trees and Shrubs, Royal Gardens, Kew*.—*Les Orchidées*, de M. Georges Mantin.—*The Flora of Somerset*, by the Rev. R. P. Murray, Part I., with map of county.—*North Carolina State Horticultural Society*. It seems familiar to read of President van Lindley in connection with a Horticultural Society! the Report is one of unusual value.—*The State of Ceara*, by Dr. José Freire Bezeril Fontenelle.—*Enumeratio Plantarum in horto Botanico Fluminensi cultarum*.—*Dictionnaire Pratique d'Horticulture*, Nicholson & Mollet, liv. 20 (Paris, O. Doin).—*Insect Life*, vol. vi., n. 2; Riley & Howard,

HOME CORRESPONDENCE.

WOOD-MANAGEMENT.—In your number for December 16 are two articles on the management of trees, from neither of which can anything of real practical value be gained. In the one upon the damage done by storm in Scotland, the chief question seems to be, how to manage plantations so that they shall not be liable to be blown down. In

the other, the writer advocates leaving the plantation so thick that it will produce bare poles, because they sell better than those which have been thinned. Neither pays any regard to the fact that different kinds of trees are different in their modes of growth, whether in plantations or as single trees, and require different kinds of management; and that plantations of two or more different kinds of trees require quite different management from plantations of one kind only. It is no doubt easy enough to grow trees so close together that they become bare poles. There was a wood here of between 20 and 30 acres of Spruce Firs which had never been thinned, clean poles, such as "S." describes the German Spruce woods to be. The January storm in 1880 blew the whole down together, a large part of them being snapped off at various heights like so many Carrots. The very few that were left standing died of starvation within the next five years. No doubt, if lucky, you may get a crop of Spruce poles a few inches in diameter that will pay well if cut down together; but if the object be to grow trees 1 foot or more in diameter that will cut into boards, it can only be done by careful thinning. And what would he say of the Scotch Fir? The young sap wood is good for nothing. On most soils it would produce no heart-wood at all if left unthinned. Larch is very generally useful at all ages both for timber and also as a nurse for other kinds of trees. I usually plant it a yard or 4 feet apart; if left unthinned for twenty years, the greater part of them would be dead and rotten, and of those left, there would be none big enough to make anything more than a rail. Of hard-wooded trees, Ash and Beech, and Sycamore and Elm, each requires a totally different management in a plantation, whether for timber or for shelter; and mixed woods very different management again. Ash runs up into poles very readily, and is valuable as such at a small size; but if required to grow into large timber, it requires most careful thinning, or it will surely be blown down. Oak is of no value whatever as a small tree; moreover, it dies if over-crowded. I need not go on; every different kind of tree requires a separate chapter, in which its peculiarities of growth must be considered, whether it be grown for profit, or for shelter, or for ornament. It is not universally true that plantation-grown Ash and Oak are of more value or pay better than hedgerow Oak and Ash. The quality of the timber of these latter is often the best, and for some purposes is the more valuable; and it may often be grown very profitably, if so planted that it does no injury to the adjoining land. C. W. Strickland, Hildenley.

ABUTILON VITIFOLIUM ALBUM (p. 783).—My experience of this beautiful shrub entirely agrees with Mr. Gumbleton's. I never knew the white flowers become blue, or the blue white; but I have known both cuttings and seeds from the blue one to produce white flowers, and vice versa. I have grown it since 1877, and have never been without it; but it is necessary constantly to get young plants by cuttings or seeds, as, like many others of the shrubby Malvaceæ, it is a short-lived species. Henry L. Ellacombe, *Bitton Vicarage*.

VITIS COIGNETIÆ.—It would be very interesting to know whence pants or eyes of this splendid Japanese Vine (see p. 781) could be obtained, and perhaps some reader in this country, or in America, or in Japan, will kindly supply the desirable information. The kinds of Grape-vine having highly coloured foliage are most valuable for walls, arbours, and pergolas, and are strangely neglected in modern gardens. F. W. Burbidge.

GALANTHUS ELWESII.—The first blooms of this species of Snowdrop opened on December 22, which is earlier by four days than I remember seeing them before. Last year the first blooms opened on Dec. 26. Between this variety and *G. Corcyrensis* there is just one month difference. I saw this latter in flower in the Trinity College Garden, Dublin, November 23 last. A collection of these early-flowering Snowdrops is not only interesting, but useful. How well *G. Elwesii* seems to be adapted for growing in strong soil! With me it not only increases rapidly both from offsets and seedlings, the foliage attains huge dimensions, accompanied with that deep glaucous tint so pleasing. E. Molyneux, *South Hants*.

MYRTLE BERRIES.—A bush of Myrtle communis has stood at the foot of a south wall in Swanmore Garden for the last twelve years, flowering profusely every year; but I never remember seeing it with a crop of berries before this year. One branch espe-

cially being smothered with them, much more so than any other part of the tree. Why this should be so is somewhat mysterious. The winters of 1890 and 1891 gave the plant a severe shock, however it has fully recovered with the above results. E. Molyneux, *South Hants*.

THE SEED, BULB, AND PLANT TRADE.—The correspondence under the above heading, so far as I have followed it, has all been on the side of the man with a grievance, and it seems to me to have reached a stage when the points at issue should have consideration from some one who, although an assistant, has some sympathy with the employer. The supply of young men in our trade, as well as in others nowadays, appears to be greatly in excess of the demand, and as a consequence only those who exhibit ability are likely to hold the few plums that are available in every establishment. I have had a good deal of experience with the average assistant through close association, extending over many years, and without taking any responsibility on my own account for this expression of opinion, I am constrained to state plainly that I fear there is little chance for the ordinary hand as I have found him, to expect to receive more than his market value, which I put down at £1 per week, or less. In special reference to the bulb and seed trade, where, I should like to know, are the most lucrative appointments to be found outside large centres? Again, ask anyone holding a leading position with a reliable firm, what is the percentage of the young men who are of any use? and the answer will be given on the fingers of one hand. To the man, however, who will take the trouble to gain some knowledge of his business and keep his head, my opinion is, that both the seed and its affiliated trades offer a very fair opening, and I am sure many will agree with me on this point. I take it that a "Union" amongst workers in our trade is an utter impossibility, and those who are urging its creation will find what I say to be true when their ideas are formulated and put into actual practice. *Agri Horti*.

PINUS INSIGNIS.—I read with interest the note from Mr. Ward in respect to a tree of the above-named species, and I recently measured one which stands in our well-known arboretum, the height of which is 70 feet; circumference of trunk 1 foot from ground, 16 feet; at 9 feet from ground, 14 feet; at 7 feet from ground, 17 feet 7 inches. This last takes in the base of large branches. The circumference of six of the branches under 7 feet from ground are respectively, 4 feet 6 inches; 5 feet 6 inches; 6 feet 7 inches; 4 feet 1 inch; 5 feet 3½ inches; and 5 feet 2 inches. The tree carries fifteen branches within 7 feet of the ground. Diameter of head, 60 feet. *James Mayne, Bicton*.

CHRYSANTHEMUMS FOR CUTTING.—One often sees Chrysanthemums used for cutting, especially for table decoration, that are quite unsuitable, but this is not from any want of varieties for the purpose. I have noticed recently fine kinds that may be grown alone for cuttings, as they are very free-blooming, not troublesome to grow, and produce graceful sprays, if not too much disbudded. These are the little Pompons named Snowdrop, which has neat, small, pure white flowers, and fit for tables of all sizes. But better than this is Jane, or Snowflake as it is also called, the flowers of the purest white, and the narrow florets are charmingly twisted. It should be grown largely, and by striking the cuttings late may be got even in January. The yellow counterpart to this, named Yellow Jane, is just as beautiful, but the flowers are richest yellow, and like those of the type, perfectly single. Orange Gem is a beautiful late variety of the colour orange, suffused more or less with a bronzy shade; it is a very free and useful kind. For table decoration the curious variety, Mrs. James Carter, is of great value. The flowers are not large, roundish, the florets short, and delicate primrose. They were much used in the various table arrangements at the recent Aquarium show. U.

POTTING SOILS.—The present is a good time for getting in stores of turf and peat: the loam taken from an old pasture with plenty of fibre in it, cut the turves about 2 inches thick, and make them into a stack about 2 yards wide, with the grass-side downwards; ridge the top to throw off rains. Different varieties of peat should be secured to be ready when required; it is best placed under a shed or in a stack, and kept dry. Leaf-soil that was got last winter, and

thrown into a stack or heap, should be turned over, and a good quantity placed under cover, to be kept in a good condition. For potting purposes it is useless when wet, and rotten. Soil heaps should never be allowed to be overgrown with reeds and grasses, but should have their exterior shaved off with a sharp-edged spade occasionally during the summer. *B. Wadds.*

ALLOTMENTS.—When the Secretary of the "Rural Labourers' League" asserts that since 1887 allotments have increased by 150,000, he should have facts to substantiate his assertion, and not mere suppositions. Hearsay, as everyone knows, is such a mendacious fellow. The assertion was made on myriads of election platforms in the summer of 1892, and it still remains the same figure, although eighteen months have elapsed. It was then met by the further assertion that actually more allotments had been furnished in Scotland during the same time, 1887 to 1892, where the Allotments Act quoted did not operate. I have had enough experience of election canards not to believe any when put forward to secure some party end, and it seems obvious that in the present instance an effort was being made to snatch credit for an Act to which it was never entitled. Repeated condemnation of the convertibility of the Act is found in the fact that other legislation, such as is furnished in the Parish Councils Bill is imperatively needed to satisfy the demands for allotments. I append a cutting from a recent *Southampton Times*, a report of a conversation at the South Stoneham Board of Guardians, which sheds a lurid light on the value and usefulness of the Allotments Act of 1887:—

"THE ALLOTMENTS QUESTION.—The Deputy-Clerk reported that he had received a communication from Messrs. Gale and Newton relative to the Wimpson allotments, stating that they regretted that matters could not be arranged, and they presumed from the Authority's letter that their offer had been declined *in toto*.—The Clerk also remarked that he had written to Mr. Webb (clerk to the County Council) explaining the whole position, and he had received a reply stating that the subject would be referred to at the next meeting of the Council.—Mr. Payne said if the Council could obtain land at from £1 10s. to £3 an acre, then they were in measurable distance of obtaining allotments for the men at 6d. a rod. Certainly the men at Wimpson ought not to pay more than that.—Mr. Scott said they had received four applications for allotments, and they had not succeeded in securing land in either case. It seemed that the Act was entirely unworkable.—The Clerk said in two or three cases land was secured privately.—Mr. Richards said the Local Board at Shirley obtained land, but it cost them so much that they had to charge 1s. per rod, and they could not get half the land taken up.—The Chairman said they could do no more in the matter." *X. Y. Z.*

SHANKING OF GRAPES.—It is a little disappointing to find in the discussion of this subject that none of the great market growers of Grapes have anything to say on the matter. If any class of growers of Grapes should have experience of this affection, surely it should be those whose vineries cover acres of ground, and who produce Grapes by tons. And yet it seems very doubtful whether in these huge market establishments shanking gives much trouble. Then it is disappointing to find these practical gardeners like "J. S. W." and "Shirburn," so practically differing as to the cause of shanking. The first, however, writes from a theoretical aspect—it may be a correct one, it may be otherwise. Still, all his belief that shanking is disease seems based upon theoretical grounds, because he does not find the trouble in outdoor Vines, no matter how heavily cropped. On the other hand, "Shirburn," evidently of a more practical mind, says at once he has cured the complaint by simply lifting Vines that were very subject to it, re-making and greatly shallowing the border, then re-planting. There has been no shanking since. Does it not present itself to the mind of most readers that an ounce of such practical result is worth a pound of theory? and does not this result also accord with what has been previously recognised as the chief cause of the trouble the Vine roots getting into gross, sour, or otherwise unsuitable soils? Vines that thrive outdoors do so only in soil that materially suits them, hence they are saved from these bad border troubles. Canker in Apples and Pears has been attributed to a fungoid disease. It may be so, but ample practical evidence has been furnished that by lifting trees and re-planting them more shallow, also by feeding the roots with the needful fertilisers, that canker has been cured. If we regard shanking pretty much as canker, both preventible affections, and both arising from imperfect root-action through soil-poverty, grossness, sourness, or similar cause, then it is evident that the treatment which cures one cures the other. There are plenty of vineries in which the crop of Grapes seems excessive, and yet there is no shanking. *A. D.*

GRAPE SHANKING.—With all our new modes of research, shanking seems to prevail as much as it did twenty or thirty years ago. Some say that this, and that, and the other is the cause, and still it seems that it is no better combated or the causes understood to-day than then. I believe that we make our borders too deep, and the editor's instructive paper on p. 624 helps to prove my theory; as will some experience I had in connection with shanking Grapes. I took the management of a place in the south of Scotland fourteen years ago, where Grapes were expected to be one of the principal objects of the place; at least, in a commercial point of view, I thought that they would have to be better grown than those that were hanging on the Vines at that time, or the returns would be very poor indeed, scarcely a berry on any of the bunches that was not shanked. However, in the following spring I collected as much fresh soil as I could obtain, not so turly perhaps as many would have liked, still it was fresh soil; the border was turned over from end to end, the roots raised to within a few inches of the surface, and all poor stuff removed, and new soil substituted for it. The inside border was renovated in one year, and the outside the following year. Although the Vines did not bear a very heavy crop the first and second years, they eventually did so well, that it more than repaid us for all the labour and expense. So long as I stayed at that place the Vines were annually top-dressed, and by this means I was enabled to keep the roots close to the surface of the border. Badness of the drainage could not have contributed to the shanking of these Grapes, which, owing to the nature of the situation, could not have been anything but favourable for the passage of the water. The borders were at the highest point more than 6 feet higher than the surrounding ground, and at the lowest 3 feet. The drains emptied themselves through orifices in the retaining wall, and whenever the border was heavily watered, there was a run of water from these outlets after an interval of three-quarters of an hour. I visited that garden this season, and was told that shanking was again troublesome, and could not be accounted for, as the Vines had been well attended to. I at once came to the conclusion that the roots had again got too far from the surface. Be it understood, that these borders were well made as regards the drainage, the soil, lime-rubble, and bones employed; but they were, to my thinking, too deep, the depth being more than 3 feet. If all should go well, I intend shortly to replant two or three vineries at Harewood, and at no part will the borders be deeper than 20 inches. I could cite another instance where the borders were level with the surrounding ground, all the same, after the roots were brought up to more congenial quarters at the surface, the Grapes were excellent. Where a good supply of water is obtainable, and but few places fail in this respect, of what use is a deep border except to allure the roots away from the genial influence of the sun and air? *J. Jeffrey, Harewood.*

SPORTING OF CYPRIPEDIUMS.

In the issue of the *Gardeners' Chronicle* for the 16th inst., at p. 753, a correspondent, "P. W.," under the head of "Do Cypripediums Sport?" invites communications. My experience has been that of Mr. Measures, but only with the same variety, *C. Dauthieri*, although I have large specimens of several other hybrids. In May, 1884, I obtained from M. Godefroy-Lebeuf, of Paris, a plant of *C. Dauthieri*. It grew quickly into a strong plant, until, in 1888, it produced a highly-coloured flower, which I sent to Professor H. G. Reichenbach, who described it in your columns, April 7, 1888, p. 255, as *C. Dauthieri* var. *Rossianum*. This is the form which appeared later in other collections, and is known in gardens as *C. D. marmoratum*. I separated the new variety from the original clump, and grew it on until it also became a fine plant, when another variety appeared, of almost one hue of lemon greenish-yellow, very slightly tinged with pale chestnut on the upper halves of the petals. This was described by Mr. N. E. Brown in the *Gardeners' Chronicle*, April 4, 1891, p. 426, as "*C. Dauthieri* var. *Poggio-Gherardo*." I took that also away from the parent-plant of *C. D. Rossianum*, and grew it by itself, and it is now becoming a nice plant. It flowered true last year, and I showed it at the last meeting of the

Royal Tuscan Horticultural Society for the third time last Sunday (December 17), and then sent the bloom to the editor of the *Orchid Review*. Two years ago, out of the same clump of *C. D. Rossianum* appeared a fresh variety—a modification of *C. D. Pog. Gher.*, inasmuch as it differed from it in having the left longitudinal half of the upper sepal, and also the whole of the left petal dark, as in *C. D. Rossianum*, the remainder being as in *C. D. Pog. Gher.* It flowered true last year, and I called it after my wife's name, "Janet," although a more appropriate one would have been "Harlequin," from its singular parti-coloration. I left it alone, but carefully marked it—as the mother-plant had not long before had a larger shift, and I did not like to disturb it—the more so that other two *Poggio-Gherardos* had appeared—which have been marked to be removed in due time. The flower of one was fertilised with *P. G.*, to see what may be the result of growing this curious variety from its own seed. *H. J. Ross, Poggio, Gherardo, Florence.*

Obituary.

THE REV. DR. GORDON, formerly parish minister of Birnie, Morayshire, died recently at the advanced age of 83 years. Dr. Gordon had the degree of LL.D. conferred upon him by the University of Aberdeen in 1859, and would have come little into public view in the remote and retired parish in which he ministered had it not been for his botanical, geological, and antiquarian researches. The late Cosmo Innes, while delivering a lecture in the North, went out of his way to say, that "there was nothing in the earth or the air or the sea that escaped the notice of Dr. Gordon, of Birnie." This, in many respects, summed up some of the leading traits in Dr. Gordon's character. He published, in 1839, *Collectanea for a Flora of Moray*. Since that time he published a number of papers on natural science in several Scottish magazines. He added the plant *Pinguicula alpina* to the British flora; and between 1844 and 1860 he contributed to the *Zoologist* a series of papers on the fauna of Moray; and to the *Edinburgh New Philosophical Journal*, in 1859, a series of papers on the geology of Moray. He was the first to discover shell-mounds on the shores of the Moray Frith, and Sir John Lubbock, who visited them in company with him, devotes several pages to the discovery in his *Pre-historic Times*. About sixty years ago he, along with a few more gentlemen, founded the Elgin Museum and Institute—one of the finest scientific collections in the North. He was in no sense of the word a popularity-hunting clergyman, but was content to go quietly in and out amongst his people, by whom, as the years rolled on, he came to be not only respected but revered.

PROFESSOR BENTLEY.—On the 24th inst., at 91, Warwick Road, Earl's Court, ROBERT BENTLEY, formerly Professor of Botany, and Dean of the Medical Faculty, King's College, London, and Professor of Materia Medica and Botany, Pharmaceutical Society, aged 72. Funeral service in St. Matthias, Earl's Court, at 1.45 P.M., and interment at Kensal Green Cemetery, at 3 P.M., on Saturday next, the 30th inst. Friends will kindly accept this intimation.

WHICH TREE BEARS THE LARGEST LEAVES?

—The Palm family bears larger leaves than any other tree. The Inaja Palm, growing on the banks of the Amazon, has leaves which reach from 30 feet to 50 feet in length and 10 feet to 12 feet in breadth. Specimens of the leaves of the talapat Palm, a native of Ceylon, have been met with 20 feet long and 18 feet broad. These leaves are used by the natives to make tents, and thus employed they make very efficient shelters from rain. The leaves of the double Coconut Palm are often 30 feet long and several feet wide. The leaves of the Cannibal-tree of Australia resemble broad planks, and are frequently 15 feet long, 20 inches broad, and 1½ feet thick at the base. These board-like leaves all shoot out at the top, and hang down so as to form a sort of umbrella around the stem. The Umbrella-tree of Ceylon has leaves of such enormous size that a single one will cover from fifteen to twenty men,

and often serves as a canopy to a boat, or a tent or soldiers. A specimen-leaf brought to England measured 36 feet round. The largest-leaved plant in this country is the Victoria Regia. One of the specimens of this magnificent water-lily in the gardens of the Royal Botanic Society had a leaf 7 feet in diameter, and capable of supporting a weight of 400 lb. *Tit Bits.*

[BY the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Principal Grazing, &c., Districts—6, Scotland, W.; 7,
England, N.W.; 8, England, S.W.; 9, Ireland, N.;
10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending December 23, is furnished from the Meteorological Office:—

"The weather during this period was again very mild and unsettled. Rain fell frequently in all parts of the kingdom, especially in the west and north, and the atmosphere was humid.

"The temperature continued much above the mean, the excess ranging from 2° in the 'Channel Islands,' to as much as 5° in 'Scotland, W.' The highest of maxima were experienced on somewhat irregular dates, and ranged from 51° in some of the more northern and eastern districts, to 54° in 'Scotland, E.' and 'Ireland, S.,' to 59° in 'Scotland, W.' The lowest of the minima were recorded during the middle part of the week when they ranged from 28° in 'Scotland, N.,' and 29° in 'Scotland, W.,' and 'England, S.,' to 34° in 'England, N.W.,' to 36° in the 'Channel Islands.'

"The rainfall was rather less than the mean in Scotland, E., and 'England, N.E.,' but more in all other districts; at most of the western and north-western stations the excess was considerable.

"The bright sunshine exceeded the mean value at some of the eastern and southern stations and over Ireland, but was about the normal elsewhere. The percentage of the possible duration ranged from 33 in 'Ireland, S.' 29 in 'Ireland, N.,' and 27 in 'England, S.,' to 13 in 'England, N.W.,' and to only 3 in 'Scotland, N.'"

MARKETS.

COVENT GARDEN, December 28.

We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day, ED.]

POTATOS.
The holidays (since last report) have put a stop to trade, Stocks held over being heavy. J. B. Thomas.

SEEDS.

LONDON: Dec. 27.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write, to-day's market presented quite a holiday appearance, with scarcely any business doing; Clover seeds of all kinds are in consequence without any quotable alteration. For spring Tares holders asked advanced rates. Values for Canary seed continue to harden, and stocks meantime, both in Liverpool and in London, are getting into very narrow compass. There is no change in Hempseed. Peas and Haricots are without any fresh feature.

FRUITS AND VEGETABLES.

STRATFORD: Dec. 27.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade has been done as under:—Savoys, 3s. to 4s. per tally; Greens, 1s. 6d. to 2s. per dozen bunches; Cauliflowers, 1s. to 1s. 6d. per dozen; do., 5s. to 7s. per tally; Turnips, 1s. 3d. to 1s. 6d. per dozen bunches; do., 3s. to 4s. per ton; Carrots, household, 40s. to 45s. do.; do., cattle-feeding, 35s. to 40s. do.; Brussels Sprouts, 1s. 3d. to 1s. 6d. per half-sieve; do., 2s. 6d. to 2s. 9d. per sieve; Parsnips, 60s. to 65s. per ton; Mangels, 22s. to 26s. per ton; Swedes, 18s. to 25s. do.; Onions, English, 150s. to 175s. do.; Dutch, 6s. to 6s. 6d. per bag; Valencia, 7s. 3d. to 7s. 6d. per case; Apples, English, 2s. 6d. per bushel.

FARRINGTON: Dec. 28.—Quotations: Celery, 9s. to 11s. per dozen; Carrots, 45s. to 50s. per ton; Parsnips, 55s. to 60s. do.; Turnips, 35s. to 45s. do.; Onions, 7s. 6d. to 8s. 6d. per cwt.; Horseradish, 1s. 6d. to 1s. 9d. per dozen; Apples, good cooking, 5s. per bushel; Blenheim, 7s. 6d. do.; Grapes, English, 1s. 4d. per lb.; Almeira, 11s. 6d. to 12s. 6d. per barrel; Chestnuts, 7s. per cwt.; best do., 11s. do.; Tomatos, 4d. per pound.

POTATOS.

STRATFORD: Dec. 27.—Quotations:—Magnums, dark-land, 40s. to 45s.; do., light-land, 40s. to 65s.; Bruces, 50s. to 70s. per ton.
FARRINGTON: Dec. 28.—Quotations:—Main Crop (Scotch), 85s. to 90s.; Bruces, 55s. to 65s.; Abundance, 55s. to 65s.; Imperators, 45s. to 50s.; Magnums, 45s. to 55s. per ton.
LONDON AVERAGES: Dec. 27.—Hebrons, 70s. to 100s.; Snowdrops, 50s. to 70s.; Regents, 29s.; Oats, 18s. 1892; Wheat, 25s. 9d.; Barley, 24s. 6d.; Oats, 16s. 10d.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending December 23, and for the corresponding period in last year:—1893: Wheat, 26s. 6d.; Barley, 29s.; Oats, 18s. 1892: Wheat, 25s. 9d.; Barley, 24s. 6d.; Oats, 16s. 10d.

AMERICAN METHODS OF HEATING BY STEAM: W. See *Gardeners' Chronicle* for September 17, October 8, and November 26, 1892, for a full description of these methods.

CATLEYA BULBS: H. E. F. and H. B. The spots are due to a fungus, but we can, at present, give you no further information. It is, unfortunately, not a new visitation.

FUNGUS ON A MUSHROOM BED: S. W.—The fungus is *Coprinus imetarius*, which is very common on dung. It is possible that the spawn was in the manure of which the bed was made, and, in the struggle for existence, the *Coprinus* came up first, gaining possession, supplanted the Mushrooms, and flourished at their expense. It is a harmless species as an eculent. M.C.C.

MEASURING CONICAL HEAP: H. F. E. First find the area of base by multiplying the square of the diameter by 0.7854, then take $\frac{1}{3}$ of area of base and multiply by the perpendicular height, which will give the contents.

MUD FROM A RIVER BOTTOM: G. T. It would doubtless grow almost anything if it were dug roughly over so as to be acted upon by frost and wind, turning it over two or three times afterwards, and well pulverising it. You might plant Willows to grow into trees, or certain kinds for furnishing osiers for basket-making; Alder in variety, *Symphoricarpos racemosus*, any species of *Populus*, *Taxodium distichum*, *Ilippopha rhamnoides*, Common Quince, Medlars, such creeping plants as *Ampelopsis* in variety, any strong-growing Ivy, and *Lycium barbarum*. For some years to come the soil would be unfitted for the growth of American plants; and we cannot therefore advise the planting of *Rhododendrons*.

MUSHROOM SOIL: H. T. Sample sent insufficient.
STREPTOSOLEN: W. T. *Solanaceæ*, Colombia, greenhouse treatment *Gardeners' Chronicle*, June 21, 1884, p. 797, fig. 147.

THE CARNATION AND PICOTEE: C. L. This manual, by the late E. S. Dodwell, first appeared in 1886, and another edition was issued in 1891. The publishers are Messrs. Groombridge & Sons, London. *The Carnation Manual*, by J. Douglas, published by Cassell & Co., Limited, London, is the more recent work.

CONTINUED INCREASE in the CIRCULATION of the "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

Increased to the extent of 75 per cent.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

W.M. COOPER'S

NOT SECOND-HAND GOODS.

SEVENTH ANNUAL CLEARANCE SALE.

Office: 755, OLD KENT ROAD, LONDON, S.E.

Works (the Largest Steam Horticultural Works in the World): 747 to 755, OLD KENT ROAD, LONDON, S.E.

Show Ground: DEVONSHIRE GROVE (adjoining).

Being the end of the Season, I am again induced to offer my Stock on hand at ridiculously Low Prices, to make room for my SPRING STOCK, for SIX WEEKS ONLY, COMMENCING DEC. 4. LAST DAY of SALE, SATURDAY, JAN. 13, 1894.

CONDITIONS OF SALE.

Goods are offered subject to being on hand on receipt of reply. Cash to accompany all orders, and prices to be strictly *nett*. All orders will be executed in rotation, and carefully packed and put on rail, except those otherwise stated.

P.O.O. payable at 794, Old Kent Road; Cheques crossed "L. and S. W. Bank."

GREENHOUSE DEPARTMENT.

THE AMATEUR FORCING HOUSE. TENANT'S FIXTURE (Span-roof).

These houses are offered at an exceedingly low rate, and should be readily approved by both amateur and professional gardeners, as brickwork, which is very expensive to a small house, is entirely dispensed with.

The utility of such a house for forcing or cultivating Cucumbers, Tomatoes, Melons, &c., will be perceived at a glance, it being a structure constantly in request but almost hitherto unknown.

Specification—Framework substantially constructed of red deal; the whole of sides, and 2 ft. 6 in. of ends, boarded with well-seasoned tongued and grooved matchboards. Half-glass door, complete with rim lock and brass fittings in one end; glass 16 oz. throughout, English cut. Ventilators supplied according to size of house, and stays necessary for opening same; stages for plants each side of house, all woodwork painted one coat of good oil paint, and the whole structure securely packed and placed on rail.

Lot.	Length.	Width.	Height.	Usual Price.	Sale Price.
1 to 7	7 ft.	5 ft.	7 ft.	£2 10 0	£2 0 0

SPAN-ROOF VILLA CONSERVATORIES.

A habitable for the lawn of a villa residence, being well and substantially-built, constructed of the best materials, and artistically finished, with diagonal panels and barge-boards. The framework is composed of 2 in. by 3 in. red deal, the lower part doubly-lined with tongued and grooved matchboards, and the roof properly fitted with sashes, which facilitates fixing or removing of same without disturbing glass.

The houses are fitted with a half-glass door, complete with rim lock, brass fittings and key, and is supplied with lattice staging for each side, footpath the entire length; gutters, down pipes, suitable ventilators, and necessary ironwork for opening same. All woodwork painted two coats of good oil paint, glass cut to sizes, and all parts securely packed on rail. Prices:—

21 oz. for Roof 5 per cent. extra.

"AMATEUR" SPAN-ROOF AND LEAN-TO GREENHOUSES. Tenant's Fixtures.

Made especially for Amateurs at a nominal figure, thereby coming within reach of those who require a strong but inexpensive structure, and being constructed in complete sections, are erectable by any handy-man or gardener in a few hours. Framework is substantially constructed of red deal, the lower part being filled in with well-seasoned tongued and grooved matchboards. The house is fitted with door complete, with rim lock and brass furniture, painted one coat of good oil colour, supplied with all necessary ironwork and stages for each side, and good 16 oz. glass throughout. All parts securely packed, and put on rail.

SALE CATALOGUE POST-FREE.

WILLIAM COOPER, 747 TO 755, OLD KENT ROAD LONDON, S.E.

THOMAS GREEN & SON, LTD.,

LEEDS and LONDON,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered

HOT-WATER BOILERS,

Others with TUBES, SHELVES, & HOLLOW or ORDINARY CAST-IRON GRATE BARS.

SADDLE BOILERS, With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant.

The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the FIRST and HIGHEST PRIZE—a SILVER MEDAL—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

MUNICIPAL PATTERN BOILER, THE BEST EXTANT.

The longitudinal section gives a view of the fire-box, water space, flues, &c. The cross section gives a view of the fire-box water space and V-shaped back. The front elevation shows it set in brickwork, which is necessary for this class of boiler.

 ROBERT WARNER & Co., Engineers, 27, Jewin Crescent, E.C.
 Dear Sirs,—It affords me much pleasure to inform you the 25 ft. Annular Sail Windmill, on 40 feet timbers, working a set of 3 10. x 9 in. stroke treble pumps, that you fixed here for Baron Schröder, is giving very great satisfaction, pumping the water through 4,224 feet of pipe, to a vertical height of about 80 feet. I must also express my thorough appreciation of the manner in which the whole of the work has been so successfully carried out.—Yours faithfully,

H. BALLANTINE, Head Gardener to Baron Schröder.
 We have a similar Mill and set of Pumps in hand for Lord Northbourne.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 5s. each insertion.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

AGENTS WANTED for the SALE of NATIVE GUANO. The Best and Cheapest Manure for all Farm and Garden Crops.—The NATIVE GUANO COMPANY, LIMITED, 29, New Bridge Street, Blackfriars, London, E.C.

C. BEESON'S MANURE.—Composed of Blood and Bone. The Best Fertiliser for all purposes. Sold in tins, 1s, 2s. 6d., and 5s. 6d.; also in air-tight bags, ½ cwt., 6s.; 1 cwt., 10s. Full directions for use sent with each tin and bag. 1 cwt. and above sent carriage paid, cash with order. C. BEESON, Bone Mills, St. Neot's, Hunts.

"I have tried this fertiliser on various garden crops, and I am able to say that it is an excellent Manure for Vegetables, Flowers, Vines, and Fruit Trees.

"A. B. GRIFFITHS, Ph.D., F.R.S.E., F.C.S."

REAL MANURE.

To make up for the loss from drought, it is absolutely necessary all should use the above immediately. Its effect is marvellous. Just one powerful ingredient makes it far superior to all others.

Mr. NOAH KNELLER, Malshanger Pk., Basingstoke Has had his supply, and says: "The exact dimensions of one Onion, 7 inches across, 19 inches round, weight 2 lb. 9 oz.; twelve Onions weighing 34 lb., which I exhibited at Reading. Grown solely by the use of CANNELL'S REAL MANURE. A farmer said that he wished his Swedes were as big as my Onions."

H. CANNELL & SONS, SWANLEY, KENT.

TO GARDENERS, &c.—A young man (age 21), requires situation. Six and a half years' experience in Market as well as private places. Good Grower of Cucumbers, Tomatos, Vines, and Peaches for early work. Highest testimonials.—**YETMAN,** Updown, Dover.

MESSRS. THOMAS KENNEDY AND CO., Dumfries, can recommend a young MAN as **ASSISTANT-SHOPMAN or WAREHOUSEMAN,** age 20.

SHOPMAN, or SECOND.—Situation wanted. Ten years' experience. Thorough knowledge of Nursery Stock. First-class references.—**J. H.,** Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

"A FRIEND IN DEED, is better than a friend in need," states the new version of the old proverb. A friend in deed is of substantial service, whilst the friend in need expects benefits which it is not always convenient to confer. A friend in deed always turns up at the right moment with kindly aid, and at Christmas-tide he is especially active, showing that his wish for peace on earth and goodwill towards men is heartily sincere. The proprietor of Holloway's Pills and Ointment is a friend in deed to humanity. Their merits are known throughout the world, and at this season they prevent or cure Influenza, Rheumatics, and all complaints of the chest, throat, and stomach.
